PITS AND FORCING-HOUSES.—If *E. H. W.* has a stove 17ft. by 13ft. (heated by Stephenson's conical boiler, and 4-inch pipe), two brick flued frames 17ft. by 14ft. each, and a Mushroom-house, 41ft. by 12ft., heated by a flue, he has certainly a right to expect that his gardener should produce at the present time Seakale, Asparagus, Cucumbers and Mushrooms. It is rather too early for forced flowers, except Hyacinths and Violets.†

IVY.—*A Subscriber* inquires if there is any fear lest the Ivy on an old tree that has fallen into a spring of water, which supplies several houses, should impregnate the water and render it unwholesome. We cannot ourselves answer this question. All we know is, that Ivy is an emetic, and therefore possesses deleterious qualities, which would make us suspicious of its effect upon water flowing among a large mass of it.†

TUBEROUS ROOTED IRISES.—*J. D.*—These may be planted in the spring in any dry and airy part of the garden. All the care which they will require afterwards, will be to keep them clear of weeds; but they must be taken up every year as soon as their leaves wither, and be kept in a cool airy place free from frost, where they may not become mouldy.†

HYDRANGEA.—*A Subscriber.*—We cannot name any agent which will with any certainty change the blossoms of this plant from pink to blue; but alum mixed in small quantities with the soil, appears to be the most effectual agent in producing that effect.‡

ANEMONES.—*J. D.*—The roots of Anemone, which were planted in spring, but which, owing to the dry weather, have only lately appeared above ground, will flower freely during the early months of the year, if protected from snow and severe frost; but they must be allowed free exposure to sun and air at all favourable opportunities. After they have bloomed and when the leaves begin to turn yellow, the roots must be taken up and kept in a dry and airy place, until required for replanting in the following November. ‡

Chrysanthemums.—*Derby.*—The following are good varieties:—C. formosum, light primrose; lúcidum, white; Celestial, blush; Beauty, pink; King, pale rose; Triumphant, blush; Chancellor, white and pink; Adventurer, yellow; Defiance, white; Diana, blush; Perfection, pale lilac; and the old Golden Lotus-flowered. ‡

Greenhouse Plants.—*S. S.*—The following list contains some of the best kinds which are suitable for general cultivation:—Hóvea Celsi and pungens, Chorozema várium, Pimelea decussata and híspida, Acácia vestita, Leschenaultia formosa and bíloba; Epacris impressa, nivalis, and grandiflora; Azálea índica alba and phœnícea, Coleonema tenuifólia, Heaths and Caméllias. You may also add a few climbing things, such as Kennédia Marryattæ, Hardenbérgia macrophylla, Zíchya glabrata, Ipomœa Leárii, and Mandevilla suaveolens. §

Passiflora Loudoni.—*W. C. D.*—This plant is usually an abundant bloomer, when planted in an intermediate stove. The reason why your plant does not flower, is no doubt owing to its being grown in a greenhouse, the temperature of which is not sufficiently high to induce it to expand its blossoms. ‡

Oleander.—*J. C.*—We cannot account for the spots which have appeared upon the leaves of your Oleander, unless you have stinted it for pot-room, or watered it too freely; either of which may have occasioned the appearance you describe. ‡

American Aloe.—*Totty* may preserve his American Aloe from all danger during winter, with perfect certainty, if he will get it quite dry, and then transfer it to a barn or stable, where it may be covered thick with straw. It will bear some frost in winter if it is dry; but if not, it will be surely killed.†

Fuchsias.—*N. B.*—The beauty of these plants is estimated not so much from the length or size of the blooms, as from the brilliancy and contrast of colour which the flower exhibits. In the measurement of the blooms, the length of the tubes and sepals only is included. ‡——*Cryptogamia* does not seem to know what Fuchsia Chandleri is, when he speaks of it as having flowers nearly self-coloured. The exhibitions at the garden of the Horticultural Society next year will set these matters at rest, and determine, beyond all question, the merits of the new Fuchsias.†

Ranunculus.—*J. D.*—These roots should either be planted immediately, if the weather permits, or they may remain out of the ground until the first favourable day in February. They require much the same treatment as Anemones, except that the soil in which they are grown should be a rich loam. ‡

Bulbs.—*Anne.*—It is impossible to say decidedly what your plants are from the mere inspection of the bulbs. No. 1, however, appears to be Vallota purpúrea, a pretty greenhouse bulb of easy cultivation, requiring to be planted in turfy loam, in a well-drained pot, and to be watered sparingly until it begins to emit roots. Water may then be freely administered, but must again be entirely withheld after the plant has flowered, until it is repotted in the succeeding autumn. This bulb, if its base is not allowed to touch the water, may also be grown in glasses, in the same manure as the Hyacinth; but it will require several years to recruit its strength, after it has flowered under such treatment. No. 2 is an Hæmanthus, probably H. toxicárius, for which a higher temperature is necessary than the preceding. The remainder are plants of the nature of I'xia and Gladíolus, and require the treatment suitable to those bulbs. ‡

Cape Bulbs, &c.—*Philo-Chronicle.*—The bulbs you mention are perfectly safe in your cellar, provided you keep them dry and prevent them from growing. We fear, however, that the temperature of 50° will be apt to start them, and then the worst effects would be produced. It would be better if you could find room for them on some warm and dry shelf of the greenhouse. The same remarks apply to the Gloxínia. §

Jonquils.—*J. D.*—These bulbs require no protection in winter; if growing in dry sandy soil, they will flower early in spring. ‡

Walnut-Trees.—*Totty* inquires whether any of our correspondents can give any information as to their experience in transplanting Walnut-trees of a large size. He wishes to move one, the stem of which is about 5 inches in diameter.

Out-door Grapes.—*F. M.*—The Black Prince (which is the same as the Alicant and Cambridge Botanic Garden Grape), Pitmaston White Cluster, and Grove-end Sweetwater or Early White Malvasia, are three suitable varieties for the open wall. The merits of Macready's Early White and Withersfield's White are unknown to us. There is perhaps no better bearer than the Esperione; but, although it colours well, it never becomes so sugary as to render it preferable to many others. You will do well to adopt the Royal Muscadine as your fourth variety: it forms a handsome bunch, and the berries are well-flavoured. It is most deserving of the sashes you mention; but these will be of no advantage, unless you make the bottom and sides close. Place them at an angle of 30 with the wall; 7 feet high at the back will do, but of course the higher the better. Vines have been forced with fermenting stable-manure, placed on the floor of the house or pit, or applied as linings to pits properly constructed for the purpose. The latter mode is the best, because it can be made available when the fruit is ripening off, as well as in the early part of the season. Some use it occasionally in regularly-constructed vineries, on account of the deadly effects which its steam produces on insects. ‖

Pears.—*R. D.*—The Van-Mons Léon le Clerc Pear is large, handsome and very good, ripening in November; but in point of flavour it is not superior to the Winter Nelis. It deserves a wall where such can be afforded for autumn Pears. The Poire Figue de Naples is best from a standard. Its quality is not equal to that of the Beurré Rance; more especially as the latter variety comes in for use when most other good Pears are over. ‖

Asparagus.—*Clericus.*—As you only intend to occupy your garden for a twelvemonth, your best plan will be, early in spring, to give the Asparagus beds a good watering with liquid manure; or probably guano dissolved in water, at the rate of 4 lbs. to 12 gallons, will be equally efficient. The water should stand 24 hours before it is used, and when drawn off, 24 gallons of water may be put to the same guano. Your beds will also be improved by giving them a good coating of salt previously to watering them. ‡——*Totty.*—We do not apprehend that a deep layer of leaves placed over an Asparagus-bed in the early spring would prevent the growth of the Asparagus by keeping off the sun's heat. Asparagus will push at its allotted time do what you will, and besides the Spanish practice shows that the plan is advantageous.†

Celery.—*Newcastle.*—Either your Celery seed must have been bad, or the plants cannot have been properly earthed up, otherwise they would have produced you something more than leaves. ‡

Truffles.—*Derby.*—We have long been expecting a communication upon the mode of raising Truffles. It certainly has been done and may be done again, but we are not informed of the exact circumstances. This, however, we know, that it is the old rotten Truffles that are to be used for propagation, and not such as are fit for table. Truffles are found buried in the soil, under trees, especially Beeches, at the depth of three or four inches, but they also occur under other trees, such as Oaks and Chesnuts. Before long we will give you the history of their cultivation in France.†

Seeds.—*A Humble Amateur.*—Seeds of the Coucourzelle and Oxalis Déppei may be obtained of the London nurserymen through any respectable country nurseryman.†

Wasps' Nests.—*V. J. N.*—Spirits of turpentine are effectual in destroying wasps' nests. For the manner of applying them, we beg to refer you to Prof. Henslow's Paper upon that subject at p. 637 of this year's *Chronicle.* ‡

Books.—*A Young Lecturer.*—For the natural arrangement of plants read "Lady's Botany" by Lindley; for structural and physiological Botany read the same author's "Elements of Botany;" for geographical distribution consult the works of Humboldt and Meyen, and the papers of Mr. Hinds, lately published in the "Journal of Botany." You will also find a good deal of information upon the subject in the *first* edition of "Lindley's Introduction to Botany," if you can procure it. For the uses of plants in medicine you should refer to the "Flora Medica," or to Mr. Pereira's "Materia Medica." †——*A Novice.*—There is no book which treats specially on grafting, inarching, &c., but directions are given upon these subjects in most works on gardening. ‡

Worm-Casts.—*W. Flyn.*—You may destroy worms by lime-water prepared by throwing a quantity of quicklime into a large vessel of water, stirring it well, and leaving it for a day till it becomes clear. The quantity of lime is immaterial, provided there is enough of it, because the water can only take up a certain quantity of lime.†——*J. G.*—Lime-water, or a weak solution of corrosive sublimate, will destroy worms on grass-plats and gravel-walks.†

Laying out Gardens.—*T. G.*—We cannot, in a newspaper, give you directions for laying out ground. The following general rules may, however, be useful to you. Never use angular figures, if you can help it, or unless there are very weighty reasons. Take care that your curves follow each other. Nothing is in general so agreeable to the eye as an arc of a circle, or a form bounded by curved lines of some sort.

Marvels.—*W.*—We have nothing to alter in our statement regarding the Acari. We cannot help "clergymen, and other persons of unblemished respectability," believing that mites may be created by electricity. We can only say of such gentlemen, "the more shame to them,"—if, indeed, there be any such, which we cannot believe.†

Shakspeare.—*Falmouth.*—We are aware of the interpretation you put upon the paragraph in question; but *it is not suited to the character of our columns*, and we do not think it true. We are much obliged, however, by the suggestion †

Falling Stars.—In answer to *D. C. L.*, we have been favoured by Mr. R. Mossman, of Thurston Gardens, Dunbar, (height above sea 280 ft., distance from sea 2 miles, latitude 55° 57′ N., longitude 2° 29′ W.), with the following account of meteors seen by him on the nights of the 10th and 14th of Nov. last: On the night of the 10th, half-past nine o'clock, meteor seen S.E. moving to N., 35° high; 14th, six o'clock, meteor seen S. moving to S.W., 43°; ten minutes past six o'clock, meteor seen S. moving to the N.E., 51°; half past six o'clock, meteor seen S.E., which fell perpendicularly; seven o'clock, meteor seen S.W. moving to S.E., 47°; eight o'clock, meteor seen due N. moving to the E., very brilliant, 64°; 20 min. past 8 o'clock, meteor seen N.E. moving to N.W., 57°; two min. before nine o'clock, meteor seen quite vertical; ten min. past nine o'clock, meteor seen E. moving S.W., 50°; 25 min. past nine o'clock, meteor seen N.N.E., which fell perpendicularly; four minutes before ten o'clock, meteor seen S.W. moving to the S.E., very brilliant, 40°. Owing to the thick haze that prevailed on the nights of the 11th, 12th, and 13th, no meteors were visible.

Miscellaneous.—*C. W. F.*—Your question is answered at p. 793. ‡——*N. Gaines.*—Your Cactus seems to be nothing more than Epiphyllum violaceum.†——*Caleb.*—No. 7 is out of print. There is very little chance of your procuring it.——*Hortus.*—There are no flower-seeds which you can obtain better in Paris than in London, unless it is the seed of Hollyhocks, Indian Pinks, and China Asters. The best of everything of that sort may be had of the best seedsmen in London. If, however, you are going to Paris, you had better inquire at the shop of Vilmorin and Co., Quai de la Mégisserie.†——*E. M. W.*—The best advice we can give you is immediately to *burn* your plant. We do not know what it is, but the swarms of brown-scale which infest it are enough to overrun a village. The plant is probably of no value, and to destroy such myriads of scale insects except by fire is, we fear, not to be hoped for.†——*W. and G. R.*—Epidendrum Pastoris has not been figured in any work. It has small orange yellowish-brown flowers of no beauty, but with the smell of Vanilla. Brassia Wrayæ we are unacquainted with. Oncidium Wentworthianum is very like O. altissimum.†——*H. K. M.*—Your plant is a Medicago, with which we are unacquainted. What is the history of it? †——*J. C. L.*—We are not acquainted with the plant, the leaf of which you forwarded to us. ‡——*F. B. G.*—Your plant is Rodriguézia secunda.†——*A. H. C.*—Your plants are Begónia Drégei, Maranta bícolor, Justícia purpúrea, and probably Luzuriaga cymosa. †——*Mr. Gray's* Pear is the Vicar of Winkfield. ‡——*Z. Q.*—Your Apple is the Blenheim Pippin ‖——*Worcestershire's* plant is Epiphyllum violáceum. †——*C. Diplock's* parcel has been received. ‡——*G. Masters.*—Your Pear, No. 1, which you had under the name of Ananas, or Pine-apple, is the same as No. 2, Passe Colmar; if you work them on each other you will then feel satisfied that such is the case :4, 5, Easter Beurré; 6, Winter Nelis; 7, probably Jean de Witte. The Apples are, 9, Wormsley Pippin; 10, London Pippin; 11, Cockle Pippin; 12, Barcelóna Pearmain. ‖——*H. E.*—Your Apples are, 1, 8, Easter Pippin, or French Crab; 3, Pigeon; 4, Lemon Pippin; 10, Acklam's Russet. The Pears are, 5, Gansel's Bergamot; 6, Achan; 7, Chaumontel; 9, Ne plus Meuris. ‖——*S. G. E.*—Your Apples are, 2, Minchal Crab; 3, a Codlin, probably Mank's; 4, Hawthornden; 5, Wine, or Queen; 6, Hollandbury; 8, Wheeler's Russet; 10, Golden Reinette; 11, Early White Margaret; the other Apples are not known. The Pears, 1 and 2, are the Glout Morceau, and have become very good, although grown in a Yorkshire climate, and in rather an exposed situation. ——*Thos Davis.*—We know nothing of "the saturated canvas."——*T. G.*—We do not know what Bird's-eye Tobacco is. The plant you have sent is some Cyperaceous species allied to Schænus.——*Quercus* next week. ——*Critic's* insects, found on old shreds, are undoubtedly pupæ cases, but of what species it is impossible to say. We should feel obliged by his forwarding a few more to Mr. Curtis for examination: they must not, however, be removed from the shreds, lest they should be crushed or in any way get injured. *R.* ——*P. Corbet.*—Enclose 6 Post-office labels, and No. 28 shall be sent you.——*Quince.*—Your small Apple is the Dutch Mignonne; the largest is the Blenheim Pippin. ‖——*J. S. B.*—Neither of your seedling Fuchsias is sufficiently handsome or distinct from other well-known varieties to be worthy of general cultivation. ‡——*E. H. W., W. H. M., A Subscriber ab Initio, Radix, W. Lee,* and many others, next week, if we can find room.——*Mr. Gray's* Chrysanthemums are—1, Lúcidum; 2, Victory; 3, Surprise; 4, Conqueror; 11, Tasselled Yellow; 12, 13, Adventure; 14, Goliath; 20, Wheeler's Changeable Yellow; 21, Marie Stuart; 22, 23, The Queen; 24, Triumphant; 25, Rosalind; 26, Rose or Pink; 31, Pygmalion; 32, Sully; 33, Decora; 34, Conspícuum; 41, Marie; 42, not known. §——*A Constant Reader's* plants are—1, Aspídium spinulosum; 2, Cistópteris dentata; 3, Aspídium aculeatum; 4, Asp. Fílix-mas.; 5, Scirpus sylváticus; 6, Potentilla argentea; 7, 8, Epipactis latifólia; 9, Nastúrtium terrestre; 10, Bidens cérnua; 11, Vicia sativa; 13, Juncus uliginosus. ‡——*A Constant Reader.*—Our advertisement of the list of articles for competition next year at the Horticultural Society's Garden is correct. ‡——*P. B.*—We will inquire. —*νηρο.*—Any one, already a Fellow of the Horticultural Society, can propose another person for election.

Errata.—The plant spoken of in Mr. Ayres's description of Claremont in No. 47, p. 775, c. *a*, line from the bottom 16, as the "Araucária Cunninghamii," which had stood out in the open ground for many years, should have been "Cunninghámia sinensis." In No. 47, at p. 773, column *c*, line from the top 3, for "there is a Larch," read "there is *not* a Larch;" and in line 6 of the same column, for "five shillings" read "*ten* shillings."

Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3*d.* each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them *delivered in any part of London* by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

Since the arrival of the Indian mail, of which we gave the particulars in our last, a proclamation, issued by the Governor-General on the 1st October, containing the announcement of his future policy, has been made public. The most important feature of this document is the determination to withdraw the troops from Affghanistan. The Governor-General, in announcing this intention, describes the disasters of last year as "unparalleled in their extent, unless by the errors in which they originated, and by the treachery by which they were completed." He states that the rivers of the Punjab and the Indus, and the mountain tribes and passes of Affghanistan, will henceforth be placed between the British army and any enemy approaching from the west; that the Affghans will be left to create a Government for themselves; that it will be his future policy to maintain peace in all parts of the Indian Empire, and that he will put forth the whole power of the British Government to coerce the state by which it shall be infringed. To this intelligence we may add the rumour that Sir Hugh Gough, with the greater part of the troops serving in China, will return immediately to India, and that a small force will be kept up at Hong-kong, under the command of Lord Saltoun, until the 21 millions of dollars, stipulated in the treaty, have been paid.—The news from France relates chiefly to the contest for the representation of the first municipal district of Paris; the Opposition had put forth all their strength, but the Government candidate has been returned by a large majority. The importance of this result is said to have been so great, that a defeat would have led to the overthrow of the Ministry.—From Spain, our advices are satisfactory. The Regent left Madrid on the 21st, and had been received at Saragossa and other important towns on his line of march with the utmost enthusiasm. The Barcelona Junta appear to have been paralysed by the first intelligence of his approach, and the people are already discontented with their chiefs. Every demonstration in favour of the movement has failed in the other towns of the province—a satisfactory proof that the affair is local in its interests. There is no doubt that the Regent will easily crush the insurrection, and that its occurrence at this juncture will give increased stability and character to his Government.—The treaty between Belgium and Holland, to which we alluded on a former occasion, has been submitted to the Chambers; it fixes the boundary-lines of the two kingdoms on terms of mutual advantage, and definitively settles all the financial questions which have been so long at issue.—From the Levant we have accounts of fresh disturbances in the Lebanon; the Druses and Maronites have joined their forces and routed the Albanian troops after a sanguinary contest, in which 600 of the latter are said to have perished. The patience of the mountaineers had been exhausted by the oppressions they have long suffered from the Albanians; and an order from the Turkish authorities to deprive them of their arms has acted as the immediate cause in bringing matters to a crisis. The affairs of Servia appear to be settled to the satisfaction of the people, although the terms imposed by the Sultan on the new sovereign are severe, and virtually deprive the country of many of its privileges. By these terms the amount of tribute is increased; the title of the new Prince is to be changed; the Turkish Pacha is to preside at the national assemblies, and a large tract of territory added to the principality by the treaty of Adrianople is again to form part of the Turkish empire.—From the United States we have three arrivals this week; the news is chiefly of domestic interest, relating more particularly to the elections in the city and state of New York, which had terminated in the triumph of the democratic party. The President had published an official statement of the ratification of the treaty with this country; but, with this exception, the political intelligence is unimportant.—From Canada we learn that Sir Charles Bagot, the Governor-General, has been dangerously ill, but is now in progress of recovery: the elections have terminated in favour of the Government candidates, but the party feeling occasioned by the late change of policy appears by no means to have subsided.

Home News.

Court.—Her Majesty and the Court return to Windsor Castle from Walmer this morning. Her Majesty has been indisposed for some days, having taken cold in the early part of the week. Sir James Clark remained at Walmer until Thursday, when the Queen was sufficiently recovered to render further medical attendance unnecessary. His Royal Highness the Duke of Cambridge left town on Thursday, and the Duchess, accompanied by the Princesses Augusta and Mary of Cambridge, left Kew on Wednesday for Badminton, to honour the Duke and Duchess of Beaufort with a visit. His Royal Highness the Hereditary Grand Duke of Mecklenburgh Strelitz accompanied her Royal Highness, and Prince George of Cambridge will also join the party in a few days.—His Royal Highness the Duke of Sussex and the Duchess of Inverness arrived last week at Hornby Castle, on a visit to the Duke and Duchess of Leeds, from Aske Hall, the seat of the Earl and Countess of Zetland, where his Royal Highness and the Duchess had been staying since the 5th inst.—His Imperial Highness the Archduke Frederick of Austria is now at Strathfieldsay, on a visit to the Duke of Wellington. During the week the Archduke has visited the Mint, the Trinity House, the Monument, the Horse-Guards, the establishment of Messrs. Mortimer & Hunt the jewellers, and the printing-house of Messrs Clowes & Sons, in Stamford-street. His Imperial Highness has also dined at the Trinity House, and with the members of the United Service Club.

Official Appointments.—The Queen has directed letters patent to be passed under the Great Seal, granting the office of Viscount of the Isle of Jersey to Colonel John Le Couteur, in the room of the late Mr. Gossett. The Queen has also appointed Mr. John Guille, Bailiff of the Island of Guernsey, vacant by the death of Mr. D. de Lisle Brock. The Court of Directors of the East India Company have appointed Mr. Lestock R. Reid, a Provisional Member of Council at Bombay. The Poor Law Commissioners have appointed Mr. S. C. Denison, Barrister-at-Law, an Assistant Commissioner, for the period of thirty days, for the purpose of inquiring specially into the employment of women and children in agriculture.

Gazette Announcements. — We learn by Tuesday's *Gazette* that the Queen has been pleased to direct letters patent to be passed under the Great Seal, conferring the honour of Knighthood upon Mr. Jasper Atkinson, of Portman-square. It is also announced in the *Gazette* of last night, that the Queen has conferred on Sir Hugh Gough the dignity of a Baronet; and has nominated Adm. Sir W. Parker, Sir Henry Pottinger, Gen. Pollock, and Gen. Nott, Knights Grand Cross of the Bath.

Pensions.—The East India Company have granted a pension of 80*l.* a year among the four daughters of the late Colonel Dennie, in addition to the pension given to the same ladies by the Crown; this is said to be the first instance in which the East India Company has granted a pension in consideration of services rendered by officers not in their own service.

Foreign.

FRANCE.—The Paris papers contain no domestic news of interest, except the accounts of the contest between Gen. Jacqueminot and M. de Portalis, for the representation of the first arrondissement of Paris. There was little doubt of the General's election for that wealthy quarter, but the opposition was so active, and displayed a degree of energy so extraordinary, that the friends of Government felt it necessary to meet it with corresponding efforts. The scrutiny took place on Wednesday, when the General was elected by a majority of 147. His defeat would have led to the overthrow of the Ministry.—It is rumoured in Paris that the Prince de Joinville, third son of King Louis-Philippe, is to be married immediately to a Brazilian Princess, and that his sister, the Princess Clementine of Orleans, is to be very shortly married to Prince Augustus of Coburg, brother of the King of Portugal.—Colonel Lagorsse, who was employed by Napoleon in negotiating the celebrated Concordat with the Pope, died at Gironville on the 17th ult., in the 72d year of his age.—Surveys have just been completed for a line of railway from Paris to Calais, and from thence to Belgium, so as to open up a more direct line of communication between the London and Dover Railway and the Continent. The line will pass through the towns of Beauvais, Amiens, Arras, and Lille, a distance of 267 miles, the total cost being estimated at 6,100,000*l.*—A committee of the booksellers and publishers of Paris was received last week by the President of the Council, and presented an address, with 146 signatures, in favour of the project of the Customs' union with Belgium. The document complains of the piracy practised in Belgium, the best French works being immediately reprinted in that country, and not only sold there at an exceedingly low price, but even introduced into France. Any measure which could prevent such a line of proceeding would, says the address, be advantageous to the parties making it. The President of the Council, after having read the address, listened with great attention to the various observations presented by the committee, which referred more particularly to the entrance of printed works into France, and their free circulation in Algeria. The President promised the committee that he would adopt such measures as should put an end to this state of things. The committee was also received by the Ministers of Foreign Affairs, the Interior, Commerce, and Public Instruction, all of whom expressed a lively sympathy for the interest of the book trade.—The heirs of the Baroness de Feuchères have advertised for sale the inheritance of the last of the Condés—namely, the splendid hotel in the Place Vendôme, the castle and woods of Mortefontaine; the extensive and noble forest of Montmorency, the favourite resort of the Parisians; the estate of St. Leu, without the chateau, which Mad. de Feuchères destroyed in order to remove that silent witness of the catastrophe of August, 1830. The mayors of the neighbouring districts, on hearing that the forest of Montmorency was to be sold in lots, and converted into fields, felt alarmed at the immense injury which the loss of the forest would entail on those districts, and addressed a petition to the King, in which they entreated him to purchase it out of the proceeds of the privy domain. Baron Fain, the Cabinet Secretary, replied in the name of his Majesty, that he wished it was in his power to acquiesce in their demand, but that, unfortunately, the enormous burdens which pressed upon the King, and the debts which they compelled him to contract, rendered the accomplishment of that wish absolutely impossible.

Algiers. — Some surprise has been occasioned by doubts which have been thrown by the English papers on the affair of Mazagran, which was extolled at the time as an act of heroism. The *Courrier Français* challenges the Ministerial papers to contradict these doubts, but they remain silent on the subject. It is stated that "the affair of Mazagran was a farce; that during the night of the so-much-vaunted attack, there had been some few musket-shots, and no more; that these were so few, that the little garrison of Mazagran did not even get up from their beds; that there was consequently neither attack nor defence, neither men killed nor men wounded, nor heroism of any kind." If these assertions be confirmed, after all that has been said and written of an affair enacted almost under our own eyes, what must we think of the authenticity of history? In this case the heroism of the French was blazoned over Europe, and subscriptions were got up in the great capitals, to which Englishmen are said to have largely contributed.

SPAIN.—The news from Spain is to the 24th instant, from Madrid, and to the 26th from Barcelona. The telegraphic despatches from Bayonne, from which we derive this late intelligence, are of a very confused and contradictory character. The Regent, instead of marching on Barcelona by Valencia, as was anticipated, had taken the Saragossa road. He quitted Madrid, as stated in our last, on the 21st, accompanied by the President of the Council and Minister of War (Gen. Rodil) and other officers. An immense crowd accompanied him out of the capital, and his popularity seemed to have been renewed by his prompt departure for the scene of revolt. He arrived at Saragossa on the 24th, and was cordially received; the Infante Don Francisco de Paulo will promptly learn from the Regent the motives of his choosing the road by Upper Arragon to Catalonia. This is, no doubt, a good stroke of policy on the part of the Regent, for if he finds that the Princess Carlotta has been plotting, or is an accomplice, for the Barcelona movement, the road to France will be indicated without ceremony to this branch of the Bourbon family. The Cortes were prorogued on the 22d the day after the Regent quitted the capital; and the Queen was left entirely to the protection of the National Guard, a mark of confidence on the part of the Regent which had given much satisfaction. From Barcelona we have a list of the Consultative Junta. It is composed of men of all shades of political opinion—Republicans, Exaltados, and Moderados. There are merchants, manufacturers, physicians, apothecaries, advocates, landed proprietors, general officers, and magistrates in the category. Gen. Van Halen had threatened to bombard the town, and was only induced to spare it from the representations of the French Consul that it was impossible to find refuge for the numerous French subjects, there being only one brig-of-war in the port, already filled with the General's own family, and other refugee Spaniards. The junta had been prolific of proclamations. One decree fixed a maximum for the price of food; and a second was addressed to the army, inviting them to join the movement. In the mean time the insurrection has made slow progress. A demonstration in its favour has failed in Valencia. Saragossa has been quite tranquil, and some of the small towns which had announced their adhesion to the movement have returned to their allegiance. Madrid up to the 24th had not moved. The south of Spain, Seville, Cadiz, &c., was perfectly quiet, and the Basque provinces had not stirred. An agitation had taken place at Palma, the capital of the island of Majorca, but the Political Chief and Captain-General having adopted precautions, tranquillity had not been disturbed, despite of incendiary publications, calling upon the population of Palma to make common cause with the Barcelona insurgents. Even at Barcelona the people are discontented with their chiefs. Llinas has been dismissed from the command of the armed force, and compelled to take refuge on board a French ship. Brigadier Durando, a Piedmontese officer, has taken the command, but the approach of Espartero seems to have inspired a general panic. The failure of the movement at Valencia is a proof that the present troubles are mere local disorders incidental to Barcelona, already confined to that city, and likely to be crushed. The Regent can have no difficulty in putting down the attempt; and perhaps he will find that it was caused more by the pressure of a military force and the necessity of supporting it on the poorer classes, than by any profound disaffection or conspiracy. Nothing, too, can have proved more fortunate for his Government than so culpable a mode of resistance; and he will know how to profit by it, without leaving any indelible marks of vengeance on the Barcelona population.

PORTUGAL.—We have Lisbon news to the 21st ult. The Government had gained an important victory on the preceding day, having carried the election of five deputies to supply the vacancies caused by deaths, and double returns for the province of Estramadura; and it was fully anticipated that in the provinces they would be equally successful. They had also carried the municipal elections at Coimbra, and generally throughout the country. Those of Lisbon and Oporto had not yet come on. Nothing new had transpired relative to the tariff question. Lord Aberdeen's answer had not yet been received, but there was no doubt in Lisbon that the Portuguese offers would be rejected. The Prince de Joinville had left Lisbon in the Belle Poule frigate, accompanied by two corvettes. A brig-of-war had been sent to Madeira with succours for the sufferers by the inundation. A committee had been formed at Lisbon, with the Marquis of Fayal at its head, to collect subscriptions; and their Majesties have contributed themselves three contos of reis (about 750*l.*). Another subscription has been opened in London with a strong appeal to all who have either in their own persons or in their families derived benefit from the climate of Madeira.

BELGIUM.—The treaty concluded between Belgium and Holland on the 5th of this month, was laid before the Chamber of Representatives on the 23d ult. It is divided into three parts or chapters. The first part fixes the boundary line between the two kingdoms. Some small portions of territory are ceded by each party, as drawn on a map annexed to the treaty. The second chapter relates to the navigation of the canals, the Scheldt, the Meuse, and other rivers. The third chapter relates to all financial questions between the two countries, which are fully and definitively settled. The treaty fills ten columns of the Government paper.—The inhabitants of Brussels have been greatly excited for the last ten days, by a tragical event which occurred at the residence of Mdlle. Heinefetter, the *prima donna* of the theatre, on Saturday night, the 19th ult. M. Caumartin, whose father was member of the Chamber of Deputies in France, was at Mdlle. Heinefetter's with M. Alme Sirey, the author of a celebrated law work, and whose father was an avocat of the Court of Cassation. A violent dispute arose between them. M. Caumartin, who had with him a sword cane, stabbed M. Sirey, who died instantly upon the sofa. M. Caumartin, after having committed this crime, fled in M. Sirey's carriage. The police was apprised of what had taken place about a quarter of an hour afterwards; the most active search was made for M. Caumartin, and all the gates of the city were closely watched. He succeeded, however, in making his escape to Paris, where he offered to surrender himself, but the officer of the Crown refused, on the ground that as no complaint had been lodged against him, he could not take him into custody. Upon this he immediately set off for Brussels, with the determination of surrendering himself to justice in Belgium. Before he departed he wrote a letter to the Procureur du Roi, in which, after announcing his resolution, he declares that he shall be able to prove that he was provoked, struck, and wounded first, and that the tragical termination of the deplorable conflict was totally independent of his own will.

GERMANY.—Letters from Vienna mention a report that the marriage of the daughter of the Duchess de Berry, with the Archduke Palatine of Hungary had been definitively agreed upon by the Aulic Council. Austria, it is said, contemplates at a future day to erect into a palatinate, for the young couple, the provinces of Bosnia and Servia, which she expects will fall to her lot in the partition of Turkey. According to these accounts M. Hyde de Neuville had been called to Goritz, for the purpose of negotiating the marriage of the Duke de Bordeaux with a daughter of the Emperor of Russia, which has always been, it seems, a favourite plan of the Duke d'Angoulême. We are happy to learn from the same source that the rumours relative to the alarming state of Prince Metternich's health turn out to be unfounded.—The navigation of the Danube concerns all Europe, and therefore the proceedings of the late general meeting have an interest which is not confined to Vienna. The result of this meeting seems not to have been such as was desired; it has, indeed, been resolved not to give up this fine national undertaking, but the shareholders being disappointed in their expectations, would not consent to make any further grant of the money required to prosecute it. The offer of an advance of 50,000 florins at two per cent. was accepted, but competent judges affirm that this sum is insufficient for the purpose. A letter from Ratisbon of the 18th ult. in reference to the same subject announces that the King of Bavaria had sent 50,000 florins to the Danube Steam Company, in consideration of the critical circumstances in which the company was placed.—The Diet of the Bavarian States was opened by the King in person on the 20th ult. His Majesty's speech, after briefly alluding to the noble spirit displayed throughout Germany, when the country was threatened with invasion, alludes to the death of the Queen Dowager, the marriage of the Crown Prince of Bavaria with the Princess Mary of Prussia, and of the Princess Adelgunde of Bavaria with the Hereditary Prince of Modena. "An excellent spirit," said the King, "manifested itself throughout the kingdom, on the right and left banks of the Rhine, as also throughout Germany, when the frontiers appeared to be menaced. All Germans were penetrated with the sentiment of one common country, and this feeling was shown at the ceremony of the Cathedral of Cologne, and at the fire of Hamburgh. It will not perish."—From Berlin we learn that Raupach, the popular German dramatist, and Tieck, the poet, whose popularity may almost be said to have been ratified by the verdict of posterity, have lately been raised by the King of Prussia to the dignity of privy councillors. We find also that another portion of the Berlin Stettin railroad, namely from Neustadt to Angermunde, was opened on the 16th ult. the Committees of the States having concluded their labours at Berlin and returned to their respective provinces. Fanny Elssler is at present the undisputed lion of the Prussian capital. A caricature has lately appeared, there, with a view to show the comparative importance in which the representative assembly and the danseuse appear to have been held by the public.

SWITZERLAND.—A letter from Berne gives the following circular, as having been published by the Vorort to the Cantons:—1. The frontiers with foreign countries are to be exactly determined, and the lines of separation between the lakes and rivers are to be fixed, to complete a new map of Switzerland. 2. The Federal army is to be armed and equipped according to the new regulations.

3. The four Swiss regiments formerly in the service of France are to be taken care of, and the cantonal Governments are charged to provide for their maintenance, as the invalid fund no longer exists. The Vorort has also named a committee of 13 members to inquire into the state of the commercial relations with foreign Powers.—Prince Napoleon Buonaparte, second son of the ex-King of Westphalia, has passed a fortnight at Geneva, whither he had come from Florence, to decide an affair of honour with General Laroche Pouchain, who, however, did not make his appearance. The Grand Duke of Tuscany had become aware of the intended duel, and prevented the General from leaving his territory by refusing him a passport. Prince Napoleon was not aware of this circumstance, and left for Stuttgard.

Italy.—Letters from Rome mention the interview between the Pope and Dr. Polding, the new Roman-Catholic Archbishop of Sydney, previously to his departure from Rome. His Holiness has appointed four Italian missionaries of the Passion to accompany the Archbishop, intending to establish a mission among the natives of Australia. Next year these missionaries are to be followed by several other members of the same order.—Cavalier Pietro Campana, the antiquary of Rome, whose museum of Etruscan antiquities is one of the most remarkable collections yet formed, has lately presented to the British Museum library a copy of his fine work on Etruscan antiquities, a copy of which her Majesty was lately pleased to accept. Cav. Campana was honoured with a gold medal from her Majesty during his brief sojourn in London.—Letters from Naples state that the King has determined on fortifying Syracuse, and that, after all the disputes connected with the sulphur question in Sicily, his Majesty has issued an ordonnance reducing the export duty on sulphur from 8 to 2 talari.

Greece.—Letters from Athens to the 7th inst. in the *Malta Times*, continue to give unsatisfactory accounts of this country. The new customs law has driven away the Ipsariots, who have returned to Turkey. The Greek press cry out loudly for a constitution. A Patras paper gives a deplorable exposition of the Greek population, and pronounces the poverty of the people greater than at any former period. The Government taxes amount to 18 millions of drachmas, to which must be added 6 millions more local imposts, making a total of 24 millions or 833,000*l.* sterling levied from a population of less than 800,000 souls, or nearly 22*s.* per head.

Russia.—Accounts from St. Petersburgh state that a project is talked of which would place Finland in a situation to rival the most flourishing countries of Europe. It is nothing less than that of uniting, by means of a canal, the Gulf of Finland with the numerous lakes and rivers of the interior over a surface of a thousand square leagues. The plans have already been prepared by Baron Rosenkampf, the head of the department of roads.—These accounts also mention the death of the distinguished Russian naturalist, Lehmann, Professor in the university of Dorpat, well known by his botanical and geological researches in Central Asia. He was born at Dorpat in 1814, and died at Simbirsk, on the 12th September, in his 28th year.

India.—The following important proclamation, issued by Lord Ellenborough for the evacuation of Affghanistan, has appeared since our last; it is dated Simla, Oct. 1:—"The Government of India directed its army to pass the Indus in order to expel from Affghanistan a Chief believed to be hostile to British interests, and to replace upon his throne a Sovereign represented to be friendly to those interests, and popular with his former subjects. The chief believed to be hostile became a prisoner, and the Sovereign represented to be popular was replaced upon his throne; but, after events which brought into question his fidelity to the Government by which he was restored, he lost by the hands of an assassin the throne he had only held amidst insurrections, and his death was preceded and followed by still existing anarchy. Disasters unparalleled in their extent, unless by the errors in which they originated and by the treachery by which they were completed, have in one short campaign been avenged upon every scene of past misfortune; and repeated victories in the field, and the capture of the cities and citadels of Ghuznee and Cabul, have again attached the opinion of invincibility to the British arms. The British army in possession of Affghanistan will now be withdrawn to the Sutlej. The Governor-General will leave it to the Affghans themselves to create a government amidst the anarchy which is the consequence of their crimes. To force a Sovereign upon a reluctant people, would be as inconsistent with the policy as it is with the principles of the British Government, tending to place the arms and resources of that people at the disposal of the first invader, and to impose the burden of supporting a Sovereign without the prospect of benefit from his alliance. The Governor-General will willingly recognise any Government approved by the Affghans themselves, which shall appear desirous and capable of maintaining friendly relations with neighbouring States. Content with the limits nature appears to have assigned to its empire, the Government of India will devote all its efforts to the establishment and maintenance of general peace, to the protection of the sovereigns and chiefs, its allies, and to the prosperity and happiness of its own faithful subjects. The rivers of the Punjab and the Indus, and the mountainous passes and the barbarous tribes of Affghanistan, will be placed between the British army and an enemy approaching from the west, if indeed such an enemy there can be, and no longer between the army and its supplies. The enormous expenditure required for the support of a large force, in a false military position, at a distance from its own frontier and its resources, will no longer arrest every measure for the improvement of the country and of the people. The combined army of England and of India, superior in equipment, in discipline, in valour, and in the officers by whom it is commanded, to any force which can be opposed to it in Asia, will stand in unassailable strength upon its own soil, and for ever, under the blessing of Providence, preserve the glorious empire it has won, in security and in honour. The Governor-General cannot fear the misconstruction of his motives in thus frankly announcing to surrounding states the pacific and conservative policy of his Government. Affghanistan and China have seen at once the forces at his disposal, and the effect with which they can be applied. Sincerely attached to peace for the sake of the benefits it confers upon the people, the Governor-General is resolved that peace shall be observed, and will put forth the whole power of the British Government to coerce the state by which it shall be infringed."

Turkey.—From Constantinople we have advices to the 7th ult. The week which had just expired had been almost exclusively devoted to the religious ceremonies of the Beiram, and no event of the slightest importance had occurred. Public business had been even altogether suspended, and the Porte, as well as all the other public offices, remained closed. Intelligence, through indirect channels, had been received of very serious disturbances in the Lebanon. It is stated that the Druses and Maronites, having joined their forces, encountered the Albanian mercenaries of the Porte at Besharé, not far from Tripoli, and, after a sanguinary conflict, put them completely to the rout. According to some accounts, upwards of 600 Arnauts fell a sacrifice to the vengeance of the mountaineers, whose patience they had exhausted by every species of outrage. The affair is said to have originated in a premature attempt on the part of the Turkish authorities to disarm the Maronites. In the excitement of victory, the latter, it is added, were guilty of some excesses, and plundered the caravan on its way to Damascus. Nearly all the property, however, was subsequently restored. The intelligence from Jerusalem was favourable. Bishop Alexander had recovered from his illness, and the construction of the Protestant church was proceeding satisfactorily. Letters from Belgrade of the 7th ult. state that the Sultan, in acknowledging the new sovereign of Servia, had imposed upon him the following severe terms:—1. The new Prince is to be styled merely Basha Beg. 2. The Turkish Pacha of Belgrade shall in future preside at the meeting of the Servian Senate. 3. The tribute payable by the province of Servia shall be increased by the sum of 500,000 piastres. 4. The six departments which were added to the principality of Servia by the treaty of Adrianople, shall again form part of the Turkish Empire. By this statement it will be seen that the privileges of the Servians have been considerably curtailed; nevertheless the country continued to enjoy perfect tranquillity. The wealthy Boyard George Philipesko was considered the favourite candidate for the regency of Wallachia, though a strong party, supported by Russia, intended to vote for the ex-Russian General Kislef. Prince Ghika had taken refuge in Austria.

United States.—We have three arrivals this week: the ship Patrick Henry, from New York, with news to the 8th ult.; the steam-ship Caledonia, which left Halifax on the 19th; and the Great Western, which left New York on the 17th, and arrived at Liverpool on Wednesday, after an extraordinary voyage of twelve days and fifteen hours. The two principal events in the United States are the publication of Mr. Dickens's "American Notes," and the elections in the city and state of New York. The former have been printed in every imaginable form, and distributed in immense numbers, price 1*s.*, over every part of the country the day after their receipt. One newspaper, *The New World*, published the entire work at 12½ cents. (6¼*d.*), and immediately sold 35,000 copies. The work is said to be very unpopular, though every one is anxious to see it. The article in the *Foreign Quarterly Review* on the American press, originally attributed to Mr. Dickens, is now supposed in New York to be the production of Dr. Lardner; though many profess to discover a striking identity between the style of the "Notes" and the article in question. The New York city and state elections had terminated in the triumph of the democratic, and the defeat of the Whig party. President Tyler had published an official statement of the ratification of the treaty between Great Britain and the United States. The 8th of December was appointed by the State authorities of New York to be observed as a day of public thanksgiving for the blessings of the year. A Boston paper states, seriously, that the inmates of the Lunatic Asylum, at a place called Brattleborough, had commenced the publication of a newspaper! and that those only "whom the majority of mankind consider insane," are to furnish communications. A New York paper quaintly remarks that "there exists no want of papers of that description already."—The Philadelphia journals remark on the protection afforded to this country by the recent treaty in the case of forgery, and state that Mr. Joseph Burton, late vestry-clerk of St. Luke's, who recently absconded, has been seen near that city, but has been compelled to fly in consequence of a reward offered for his apprehension. Mr. Burdekin also, the late manager of the Manchester Bank, has been recognised, and both defaulters will, no doubt, be soon apprehended and restored to this country.—The ship Panama had arrived at New York from Canton. Her Captain reported that he spoke, in lat. 25, long. 60 N., the whale ship Ontario, the Captain of which reported that a French squadron had taken possession of the Marquesas group of islands, landed troops on them, and fortified two of the largest. The commander of the fleet had, it was added, sealed orders, which he did not open till he arrived off the islands.—Mr. David Turnbull, formerly British Consul at the Havannah, and well known to the English public by his recent work relative to Cuba, has been seized by the authorities of that island, treated with the greatest indignity, and thrown into prison, although he landed from a sloop-of-war in an official capacity, as the recognised agent of the British Government. The causes of this outrage, which can hardly fail to be resented by the home Government, are his well-known opinions on slavery, coupled with the freedom and sincerity with which he has expressed them. To give some colour to the indignity inflicted on that gentleman, a rumour had been circulated that he was insane.—The accounts from Texas come down to the 4th ult.; they are filled with nothing but war. The Texans had determined, it is said, to carry on the war against Mexico in earnest. A variety of details, movements, and skirmishes are given, but a repetition of them would have little interest for our readers.

Canada.—The Canada papers received by the Caledonia are to the 12th November. Sir Charles Bagot, the Governor General had been dangerously ill, and fears were at one time entertained for his life. The *Montreal Courier*, of the 11th, states that His Excellency was "rather better at the date of the last accounts." Mr. Gibbon Wakefield had carried his election for Beauharnois county by a majority of 737 over his opponent Col. Scriver. The majority was entirely made up of the votes of three parishes, where the population is exclusively French Canadians. Mr. Murray, who had successfully opposed Mr. Baldwin in the Hastings election, had been dismissed from his situation of clerk of the peace. His party attributed his dismissal to the circumstance of his having defeated the Government candidate, and the act had excited quite a sensation amongst the British party.—The shock of an earthquake was felt at Montreal on the 9th ult. It was very perceptible, and resembled the heavy rolling of Artillery. It was also experienced at Quebec, Lachine, Three Rivers, and several other places.—It appears by an official return that the present year has been very unpropitious for the trade of Canada. Up to the 1st of October, the number of vessels entered at Quebec was less this year by 411 than during the corresponding period in 1841, while the amount of tonnage had decreased 433,743 tons.

CITY.

Money Market, Friday.—Consols closed at 93¾ to 4 ex div. for the opening—equal to 95⅝ ¾ div. included. Bank Stock, 171 to 3; Three per Cents. Reduced, 94⅛ to ¼; Three and a Half per Cents. Reduced, 101; New Three and a Half per Cents., 101⅝ to ¾; India Stock, 264½; Exchequer Bills, 50*s.* to 52*s.* prem.

Metropolis and its Vicinity.

New Houses of Parliament.—The workmen have now commenced their labours on the future residences of the Speaker, the Serjeant-at-Arms, and the Lord Great Chamberlain. The other parts of the edifice, the clock tower, and the libraries of both houses, are in a forward state.

Metropolitan Improvements.—We learn by last night's Gazette that Government has appointed an unpaid commission, for the purpose of considering, on comprehensive principles, the various plans suggested for the improvement of the Metropolis. The commission will not have authority to undertake plans of improvement, or to enter into engagements with respect to them; but will investigate the merits of various proposals, estimate the charge of effecting improvements, and the probable revenue to be derived from them; and consider the bearing of each detached scheme, not only upon the immediate vicinity, but upon the general convenience and health of the Metropolis. The following noblemen and gentlemen are announced as the members of the commission:—The Earl of Buckingham, the Lord Mayor, the Earl of Lincoln, Mr. A. Milne, Hon. C. A. Gore, Lord Lyttelton, Lord Colborne, the Right Hon. J. C. Herries, Sir R. Inglis, Sir C. Lemon, Sir R. Smirke, Mr. H. T. Hope, Mr. Gally Knight, and Mr. C. Barry.

Westminster Abbey.—A monument, subscribed for by the friends of the abolition of slavery, has lately been erected in the Abbey, to the memory of that persevering advocate of the anti-slavery cause, Mr. Zachary Macaulay. It is a sarcophagus, enriched with appropriate emblems, and surmounted by a bust, which is said to bear a strong resemblance to the deceased, and to be expressive of the peculiar mildness and benevolence of his character.

Hall of Commerce.—On Monday this building, erected on the site of the old French Protestant Church in Threadneedle-street, was opened for the inspection of the public. It is built in the Palladian style, supported by pillars of the Corinthian order. Its width is 47 feet, and its length 107. It is intended to be used as a hall of assembly, or exchange, for merchants and travellers, and is capable of containing nearly 3,000 persons. There are suites of offices and apartments, which are to be used as reading or committee rooms, and the whole of the building is warmed and ventilated on a system similar to that adopted in the British Museum. The business opening will take place in January. In front of the building is a bas-relief, representing the genius of Commerce surrounded by Industry, Liberty, and Peace—affording an interesting example of the effect of bas-relief as an architectural ornament. Several hundred persons visited the hall during the day, and it was generally admired as one of the finest buildings in the Metropolis.

Metropolitan Churches.—Aldgate church, which was injured by lightning about two years since, was re-opened on Sunday for divine worship, after having been thoroughly repaired. Since its close the old roof and steeple have been removed and newly erected, and the interior has been extensively decorated. The sermon was preached by the Bishop of London. In alluding to the decoration of churches, his Lordship said that, "as they were distinguished for the holiness of their object, so should they be for the majesty of their appearance and their beauty within. No good man could scruple at the care bestowed upon splendour which should contribute to piety. The Almighty had showered his goodness upon them; why, therefore, should He not be honoured in his temples by some of his richest gifts?" He regretted that it had not been found possible to give additional accommodation to the poor; but he trusted that before long there would be another church in the parish, and at least two more ministers.—It is announced that the late Dr. Ireland, Dean of Westminster, has left by his will 5,000*l.* Three per Cent. Consols "to the Managers or Trustees for the time being of the Metropolis Church Building Fund, to be laid out and applied in the building or purchase of a chapel in some convenient part of Westminster, under the direction of the Bishop of London."

Royal Exchange.—At the meeting of the Gresham Committee on Friday, the 25th inst., Mr. Richard Westmacott, A. R. A., was appointed by ballot to fill the pediments of the Royal Exchange with sculpture. The sum voted for this purpose by the committee is 3,000 guineas. The mass of buildings in front of the Exchange, known as Bank-buildings, will be removed in the course of the spring, to make room for the statue of the Duke of Wellington.

Bank Robbery.—One of those unfortunate casualties which are happily now of rare occurrence befel the London Joint Stock Bank on Saturday. A collecting clerk in their employ, named Edwin John Jordan, absconded in the course of the afternoon, after having received several sums of money, amounting to 19,715*l.* The police and telegraph were set to work immediately on the discovery of his flight, and the numbers of the notes were advertised. On Tuesday, however, the sum of 19,415*l.* was restored by him through one of his friends, leaving 300*l.* to be accounted for. It appears that he had been sent in the usual course of business to collect the amount of different cheques, amounting to the sum above mentioned, the Joint Stock Banks not being allowed the privilege of the "Clearing House," an establishment kept up by the private bankers for the settlement of cheques. On receiving the cash for these cheques, he exchanged bank notes for 500 or 600 sovereigns at the Bank of England. It is said that he repented soon after he absconded, and wrote to a friend on the subject, expressing his regret at what he had done, and his willingness to restore the property. The place of his concealment is not known, and rewards are still offered for his apprehension.

Chinese Trade.—The opening of the Chinese ports by the treaty noticed in our last has already produced a beneficial effect on the commercial circles in the City. A circular has been issued this week by a leading firm, intimating their intention to despatch, on the 15th of every alternate month, commencing next February, a first-class ship to China, calling at Hong-kong for orders, and afterwards to proceed to the principal port or ports which may be open to our trade at the time of arrival.

St. Bartholomew's Hospital.—At a meeting of the Governors of this hospital last week it was resolved to adopt a report from the Treasurer and Almoners recommending the appropriation of six houses, the property of the hospital, and situate in its immediate neighbourhood, for the formation of an establishment for the accommodation of a certain number of pupils. The report detailed the advantages likely to arise from providing accommodation, more particularly for pupils coming from distant places. It stated that in many instances young men of great promise had been led into habits fatal to their education, character, and prospects in life, and destructive of their moral sense, by taking their chance in houses of which they knew nothing upon their arrival in the metropolis, remote from the protection of parents or friends. By such an establishment as that proposed, it was calculated that the apprehensions naturally entertained for the morals of their sons would be, at all events, considerably abated, as the young men would be watched over by the authorities of the hospital, who would prevent, by their advice and assistance to the inexperienced, a great deal of the mischief which daily arose from the want of good counsel and the presence of temptation. It is supposed that the establishment will fully pay its own expenses. The education and training of the medical students who are collected in the Metropolis at this season of the year more directly affect the public than the condition of any other professional class, and hence the establishment of such an institution cannot fail to interest the public, independently of its advantages to the parties immediately concerned.

Scottish Hospital.—The 107th Anniversary of this well-known Charity took place on Wednesday evening, at the London Tavern, the Earl of Haddington, First Lord of the Admiralty, in the chair. In proposing the toast of the Army and Navy, his lordship paid a high compliment to the troops and marines of the East India Company, and said that within the last half-century no British company could have been called on to drink that toast with more gratitude and enthusiasm than at the present moment. "To the unwearied exertions, gallantry, and patriotic spirit of endurance of our brave sailors and soldiers, we owed the happy news so lately received of peace in India and China, the consequences of which it was not easy yet to foresee. Our disasters last year in Affghanistan had been repaired and the character of our country had been vindicated on the very scenes where those disasters took place, the result being that the invincibility of the British arms was once more asserted to the satisfaction of the people of India. Nothing was more likely to perpetuate our arms in that country, or keep it in peace, than the *prestige* of our late victories, which he trusted would for a long time be rivetted on the minds of the native population of India. Fortunate it was that the very singular warfare which had been carried on in China was now brought to a close. It had been brought to a conclusion by the united efforts of the army and navy, which had acted together with a concord highly creditable to both branches of the service; and it gave him, in the situation which unworthily he had the honour to hold, a pride and satisfaction which he could not express, to see the accounts of the manner in which our gallant admiral on the coast of China disembarked his brave sailors and land forces to act as one body against the enemy."—The meeting was numerously attended, and the subscriptions announced amounted to nearly 400*l.*

City Police.—The City police committee have sent in a report to the corporation relative to the expenditure of the last year. From this report it appears that the number of constables appointed in December was found sufficient for the security of the City; and the committee advised that the force for 1843 should not exceed 542 men; that an order should be passed directing a rate to be made for one quarter, from Christmas to Lady-day, of twopence in the pound on the net annual value of all houses, and one penny per square yard on all vacant spaces of ground, in the mode prescribed by the Act of Parliament; and that a further order should be passed, prior to Lady-day next, for a rate either for the remainder of the year, or some shorter period, such as circumstances may appear to require; in addition to which, the incidental expenses for the year 1842 may be charged upon each ward respectively.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Nov. 19th, was 886. Males 433, females 453. Weekly average for 1838-9-40-1—males 467, females 445. The distribution of this mortality over the different districts was as follows: West districts, 124; North, 206; Central, 183; East, 178; South, 195.

The Model Prison.—As the day for receiving prisoners in this new establishment is fixed for the 15th inst., some particulars of the arrangements have been published in the daily papers. The most striking features in the prison are those which carry out the combined systems of silence and separation, and the readiness with which every part of the building can be visited by the officers. The galleries and ground-floor, in which the prisoners are confined, branch out from an entrance-hall, through which the main building is entered. In this area, the governor's inspecting box is situate, and thence a full view is obtained of every part of the prison. These galleries are reached by iron staircases, which enable the officers to visit every cell in a short space of time. There are 520 cells nearly 13 feet in length, about 7 feet wide, and not quite 9 feet high. Opposite to the entrance door, and at about 6 feet from the ground, is a window of ground glass 3 feet wide by 16 inches deep. The cells are fitted up with metal wash-hand-basins and water-taps, and each convict is to have 8 gallons of water per day. Religious books, at the discretion of the chaplain, will be supplied to each cell, and the prisoners will be required to attend divine service daily. A small iron handle within the cell, communicating with a bell, will enable a prisoner to obtain the attendance of a turnkey at any moment. On hearing the bell in either of the galleries the officer in attendance immediately casts his eye down the corridor, and sees, projecting from the wall, the number of the cell in which the prisoner is confined, and which is thrust out by the same movement which struck the bell. In the door of the cell is an inspecting-glass, which looks in upon a little box, covered with wire, and through this the officer on duty, whose step will be unheard by the prisoner, can see the interior of the cell, without being himself seen. In another part of the door, is a flap which, upon being unlocked, falls down, and forms a shelf, whereby the prisoner's meals are introduced into the cell. These meals are conveyed along the galleries on a skeleton waggon, the iron balustrades on either side forming a sort of tramway, on which it is rapidly conveyed. Each cell is lighted with gas, which is entirely beyond the control of the prisoner, and will be extinguished at a given time by the officers. The chapel is so arranged that the prisoners cannot observe each other. It is divided into two compartments, down the centre of which the convicts will enter from a passage communicating with the several corridors of the prison. A separate compartment will be occupied by each; and, while divine service is being performed, they will be subjected to the scrutiny of the turnkeys from various parts of the building. The prison contains various exercising grounds, in which the convicts will be allowed to walk at least one hour every day. During this period, and when proceeding to chapel, the prisoners will wear a mask of dark cloth, which, while it will allow them to see every object distinctly, will effectually prevent personal recognition. Instruction in trades will be given daily by the schoolmasters, of whom it is intended to appoint one for every 100 prisoners. Among the regulations of the prison, the more material are the following:—The convicts are not to be left uninspected during the day for a longer period than one hour. They are to be visited daily by the governor, deputy-governor, and chief officer; and by the chaplain, medical officer, and schoolmaster, twice every week. The principal turnkey must report to the governor any misconduct of the inferior officers complained of by the prisoners, who will be permitted to see the visiting commissioners, the governor, chaplain, or medical officer, upon application through the principal turnkey. This officer, on his own responsibility, can remove to the infirmary any prisoner taken suddenly ill. There are two chaplains connected with the establishment, whose duties will be entirely confined to the convicts. The prisoners, while undergoing confinement, will be allowed to communicate with their friends in writing four times a-year. The erection of this prison has cost 85,000*l.* The prison was visited last week by the Archduke Frederick of Austria and by the French Ambassador, both of whom expressed their approbation of the plan, and their belief that it would be soon adopted by the Continental governments.

Anti-Corn-Law Meeting.—On Thursday night a crowded meeting of the first division of the Metropolitan Association, which comprises the parishes of St. Martin-in-the-Fields, and St. Anne and St. Margaret, Westminster, was held in the theatre of the Mechanics' Institution; the building, which will seat 1,100 people, was so completely filled that there was not standing-room. The chair was taken by Mr. Warburton, late M.P. for Bridport. He opened the business of the evening by referring to the recent division of the Metropolis into sections by the League, for the purpose of carrying on the agitation in furtherance of the object, and by congratulating them on the contrast which the present large and unanimous meeting afforded to one held near the same spot rather more than a year ago. Mr. Villiers then addressed the meeting at great length, and concluded by moving "That the state of trade and commerce, the rapid increase of pauperism and crime, the continued decrease in the public revenue, and the general discontent of the people, are circumstances which, while they demand an instant remedy, have their origin in the vicious policy which has restricted the field of national capital and industry, and which, while its advocates have recognised theoretically the right of the community to buy in the cheapest market and sell in the dearest, has been practically continued in the new Tariff and Corn-Law." Mr. Ricardo having seconded the resolution, some interruption ensued in consequence of an attempt on the part of the Chartists to interfere with the order of the proceedings. After some confusion, it was agreed that they should be heard, and Mr. Blackmore, who was assailed with cries of "No Chartists," spoke at some length, concluding by moving as an amendment, that delegates be sent to the conference at Birmingham on the 27th inst., to assist Mr. Joseph Sturge in his struggle for the repeal of the Corn-Laws. Mr. Ewart, M.P., followed in favour of an immediate repeal, contending that the Government and Legislature would do nothing unless the people spoke with an imperative voice; and that on the exertion of the people must rest the repeal of the Corn-Laws. He concluded by moving—"That as no reliance can be placed on the wisdom or patriotism of the Government or of the Legislature for relieving the country from its difficulties, the intelligence and moral feeling of the people must be appealed to as the means of inducing the powers of the state to deal equal justice to all ranks of her Majesty's subjects." Sir De Lacy Evans seconded the resolution, and referred with satisfaction to the speech of Mr. Escott, reported in our last, whose observations, he said, naturally drew much attention; and however gratifying the speeches from his friends round him might be, the speech of such a person as Mr. Escott must be still more valuable to their cause. He congratulated them upon their present meeting; he looked upon it as a good commencement of the campaign, and as a good reason for strenuous exertion. Dr. Bowring supported the resolution. He said that other questions, such as negro slavery, and Catholic emancipation, interested only a portion of the community. The Corn-Law question interested all mankind; and if any one still doubted the efficacy of repeal, he would urge them to consider it in reference to its mighty importance upon the permanent interests of the world. The world looked to England for a great example, and every Englishman ought to feel that it rested with him to take a large and expansive view of his duty to others. Let there be no more separation between different countries than between different sides of the street. Let all be united for the general good. They had heard of wars and of armaments, but he looked upon the custom-houses erected, not to provide revenue for the Government, but money for individuals, as the most bellicose and the most repulsive of all. Col. Thompson then concluded the business of the meeting by moving a resolution for opening a subscription book in London.

Marylebone.—In consequence of the increase of distress and pauperism which has recently taken place in this parish, the directors and guardians of the poor appointed a committee to investigate the cause. Their report has just been published. It states that the committee, in prosecuting their inquiries, obtained returns from the parishes of St. Pancras; St. George, Hanover-square; St. James, Westminster; St. Leonard, Shoreditch; also from the Strand Union, the Holborn Union, and the Greenwich Union; and by comparison they find that, while pauperism has increased in Marylebone within the last two years 20 per cent. in the in-door, and 106 per cent. in the out-door poor, taking the average of the before-mentioned parishes and unions, the increase has only been 10 per cent. on the in-door, and 24½ per cent. on the out-door poor. This clearly shows that no general cause has operated to produce the amazing increase. From the tables which accompany the report, it appears that pauperism has been dealt with in this parish in large masses, which is not the case in other districts—for example, the average number of out-door poor receiving relief in November 1840, was 2,841; the average number receiving relief in February 1841, 5,563; showing that in the short space of three months the out-poor increased 2,722, and that the average number receiving relief for the whole of

February 1841, as compared with November 1840, was nearly doubled. The bread distributed to the out-door poor in 1840, was 51,681 4lb. loaves; in 1841, 89,792 4lb. loaves; and in 1842, for the year ending in October, 133 553 4lb. loaves; showing the increase of 81,872 loaves distributed in 1842 over and above the 51,681 distributed in 1840. The account of money and bread distributed for the last three years, shows that in 1840, the sum expended amounted to 11,224*l.*; in 1841, to 14,230*l.*; and in 1842, to 17,878*l.*; showing an increase of 6,654*l.* distributed in out-door relief in 1842, over and above the sum of 11,224*l.* in 1840. The consequence of this increase in the expenditure on account of the in and out-door poor, has been that no less a sum than 17,797*l.* has been drawn from the vestry in the space of three years, over and above the estimates furnished, partly on which estimate the rates for the respective years have been levied. The report, in adverting to the great increase of claims for relief, and the admission of those claims, recommends as one means by which they might be reduced, that a more strict and diligent inquiry be instituted into each case. The report then goes on to detail the questions put to each inspector of casual poor, and the several answers. From these it appears that the number of mechanics out of employment is greater now than the average of the last three years, but that the increase in the applicants for poor-house relief has taken place principally among labourers with families.

Public Meetings. — The Peninsular and Oriental Steam-packet Company held their meeting on Wednesday, at which a dividend of 3½ per cent. for the six months ending the 1st ult., or at the rate of 7 per cent. per ann., was declared. The report states that the directors have been enabled by the steady increase of the traffic of the company to maintain the rate of dividend they had before paid, and this at a period when all other establishments of a similar character have complained of a diminution of receipts from the unsatisfactory condition of commerce. The company's fleet is represented to be so complete, including the new iron steam-ship, the Pacha, that for the future there will be no necessity for the assistance of chartered vessels to carry on the service. For the additional service of calling at Falmouth for the outward mails to India, the Government have consented to pay the company 2,000*l.* per annum, so long as it shall last; and have released the company on liberal terms from keeping up the communication between Malta and the Ionian Isles, since it proved to be unproductive. The report then alludes to the departure of the Hindostan, which, from the advice the directors have received of her passage out, made way to the Cape de Verds from Gibraltar, a distance of 1,569 miles, in 163 hours, having arrived there on the 8th of October, and was expected to be at Calcutta early in December. The Bentinck, the sister vessel, will, it is said, be launched about January next. The total amount of capital invested, and paid up, is set forth at 432,838*l.*, and the instalments not yet called for amount to 141,812*l.*

Fires.—On Tuesday evening a fire broke out in the well-known establishment of Messrs. Warren, blacking-makers, in the Strand. It originated in the cellars among the straw and crates, where the men had been shortly before employed. In consequence of the dense volume of smoke, the firemen were unable for some time to enter the premises; but being well supplied with water, they were at length enabled to arrest the progress of the flames, and prevent their extending to the shops and warehouses, otherwise the whole of that extensive establishment must have been destroyed. The damage is said to be considerable in amount, but the firm is insured against loss.

Hanwell Lunatic Asylum.—The fourth report of the resident physician of this asylum was circulated on Wednesday among the magistracy. From the statistical results of the past year, it appears that 166 patients were admitted—viz., 80 males and 86 females; of whom 12 males and 8 females were cured, 2 males and 2 females relieved, and 9 males and 7 females died. The number of patients admitted into the asylum from its opening, on the 16th May, 1831, to the 30th of September, in the present year, was—males 1,189, females 1,219; total 2,408: of these, 283 males and 266 females were cured, 57 males and 36 females relieved, and 459 males and 371 females had died. On the 30th of September there were remaining in the asylum 936 patients—viz., males 390, females 546. The report proceeds to state that the number of deaths during the year was 91; of these, about 40 were from general debility or paralysis, 18 were occasioned by apoplexy or epilepsy, and 15 from pulmonary consumption—leaving a mortality of only 20 from various diseases accidentally or less frequently associated with insanity. The average daily number of patients in the asylum during the year was 943. The greatest number of deaths in one month occurred in January; but of the 16 dying in that month, 9 sank under general paralysis—a disease attended with great debility. The smallest number of deaths occurred in the autumnal months, when the cases of sickness were the most numerous. By the table of the causes of death within this period, it appears that a large proportion of the deaths took place in patients previously much enfeebled, and who sank into that state of general debility in which every function gradually becomes weak, and life is at length extinguished without effort.

Woolwich.—Her Majesty's steamer Wilberforce, commanded by Lieut. Webb, which left the coast of Africa about the 11th of Oct., arrived at Plymouth on the 17th, from the Niger Expedition, and has been ordered to this port to be paid off. She is principally manned by coloured people, there being only four or five Europeans, who were taken from other Government ships, and but three of those who joined the expedition originally—viz., the commander, carpenter, and engineer, all of whom were attacked by fever. The Wilberforce had been sent up the river to the model farm, and found it in such a state of disorganisation, that she brought away the farm implements and all the people employed there.

Provincial News.

Her Majesty's Visit to Walmer.—The stormy weather which prevailed towards the end of last week prevented Her Majesty from making any excursions in the neighbourhood. On Friday and Saturday the Queen and Prince Albert walked on the beach during the intervals of the rain, but were unable to remain out for more than an hour on each occasion, in consequence of the boisterous state of the weather. During a heavy gale of wind which prevailed in the night of the 22d, four Deal boatmen, in attempting to board a foreign ship in the Downs, in a distressed and hazardous state, were unfortunately drowned. Her Majesty and Prince Albert, on hearing the circumstance, sent a donation of 20*l.* on Saturday to the Mayor of Deal to be divided among the four widows in equal proportions. The Queen appears to have caught cold during the stormy weather of Saturday, and was confined to the Castle until Thursday last, attended by Sir James Clark. On Tuesday Prince Albert visited the South Foreland Lighthouse, and on Wednesday went on board Her Majesty's brig Wasp, commanded by Captain Drew. His Royal Highness was conveyed to the vessel by Captain Bullock, in the Government steamer Fearless. The brig lay at anchor within a short distance of the Thunderer, which ship manned yards as the Prince passed in going to the brig. His Royal Highness was received on board with a royal salute, and conducted over the vessel by Capt. Drew. After remaining on board about half an hour, the Prince proceeded with Capt. Bullock, in his steamer, to the Beacon of Refuge on the Goodwin Sands, erected by Capt. Bullock about two years since. In their course to Trinity Bay, where the beacon is fixed, they passed upwards of 100 sail of outward-bound vessels proceeding through the Downs. The scene at this time was extremely animated, and highly enjoyed by the Prince, who observed to Captain Bullock that it far exceeded, in point of variety and grandeur, anything which could be witnessed off the coast of Sussex, in the immediate locality of her Majesty's marine residence at Brighton; "to which," said his Royal Highness, "it cannot be compared for one moment." The sands not being dry, his Royal Highness was unable to land, and therefore, after going round the beacon, the Prince returned to near the place of embarkation, and went round the Thunderer, which again manned yards, and fired a royal salute. Capt. Bullock then brought his vessel to an anchor about a quarter of a mile off Walmer Castle, and landed the Prince and his attendants in the gig at 3 P.M. His Royal Highness expressed himself highly delighted with his excursion, and complimented Capt. Bullock for having overcome those numerous obstacles which had heretofore prevented, on the most dangerous part of the Goodwin Sands, the erection of a refuge for the mariners of all nations.—On Thursday her Majesty had perfectly recovered from the cold she had been labouring under for some days, and Sir James Clark was relieved from his attendance at the Castle: her Majesty, however, had not left the Castle. Preparations were making for the departure of the Court for Windsor, and it was arranged that her Majesty would leave Walmer on her return, at an early hour this day.

Blandford.—On Tuesday the long-pending match made by the Hon. Grantley Berkeley, that he would "hobble" or secure five bucks in a given time, with the assistance only of a horse and a hound, was decided at Charborough Park, near this town, the seat of Mr. Drax, M.P. Bets to an enormous amount were pending the result, long odds having been laid by several noblemen and gentlemen against the success of the undertaking. The conditions were, that in the course of the day Mr. Berkeley should, with the aid of one dog only, pull down, "hobble" (that is, secure by fastening the legs together), five bucks, and leave them in possession of the servants, by whom they were to be put into a deer-cart, provided for the purpose. When so carted, they were to be examined by the umpires, and each one found uninjured—that is to say, without any serious wound or hurt—was to count for the captor. Mr. Berkeley's apparatus for "hobbling" was very complete; the horse, Brock, he had trained to ride up to the courses, would lie down at the word, so as to leave him free to deal with his quarry; and his dog, Odin, a noble deer hound, had already pulled down his three bucks in one day. The park was literally crowded with spectators. After the arrangement of the preliminaries, a fine buck was selected, and separated from the herd. The deer soon got out of sight, and for some time the anxiety as to the result of the first trial was manifest among the spectators. It proved, however, to be a decided failure. The buck turned on the hound and completely held him at bay, notwithstanding the continued cheering of his owner for him to go in and seize him. The deer kept butting up with his antlers with great ferocity against the iron rails at the extremity of the park. At length another buck was selected from among his companions; but the result was much the same, for he also, after a run of about ten minutes, turned upon his pursuer, and commenced butting him, with a determination only equalled by the former deer. At this time the dog had received considerable punishment, and Mr. Berkeley, finding the case hopeless, gave in the match to the great disappointment of the spectators. Subsequently three of Mr. Drax's hounds were called into the field, and after a short run the foremost hound pinned his prey, and the Hon. Gentleman dismounting, grappled with the deer, which he soon hobbled and secured, and completed the task he had failed in accomplishing with a single dog. Another deer having been chosen, was likewise captured by Mr. Berkeley.

Bristol.—An affray took place at Mendip a few days since, at a public-house called the Hunter's Lodge, between some labourers who endeavoured to cheat the landlord of the reckoning. During the fight, a man named Brittan was so much injured that he died soon afterwards; at the adjourned inquest the Jury returned a verdict of manslaughter against the party principally concerned, who has been committed to take his trial.

Chester.—From the recent charge of the Bishop of Chester, it appears that within the last twelve years upwards of 170 new churches have been built within this diocese alone; by far the greater number being additional to those previously existing. The increase of accommodation appears to be—in Cheshire, upwards of 21,000 sittings; in Lancashire, 90,000 sittings; and in Westmoreland, nearly 50,000 sittings.

Dover.—It is stated in the Dover papers that the harbour commissioners have determined upon making extensive alterations and improvements for widening and generally enlarging the harbour; so extensive, no doubt, as to leave it beyond a matter of question that the Government intend making Dover a harbour of refuge. All the old buildings, including the Dover Castle Inn, Amherst Battery, and the warehouses and buildings occupied by the shipwrights and others, are to be pulled down and their sites thrown into the harbour. The railway terminus will also cause extensive alterations, so that the aspect of the town is likely to be completely changed.

Gloucester.—We last week noticed the committal of Frances Bennet, and a man named Yapp, charged with the murder of their six children at the Forest of Dean. We have now to state, that in the case of the female prisoner, the hand of justice has been anticipated by her death, which took place on Friday morning, in the hospital of the gaol. Since her committal, her mental sufferings are said to have been most severe. An inquest has been held, at which the surgeon stated that she died of pulmonary consumption. She was only thirty-eight years of age, and was in a dying state when first brought into the prison. The jury, after examining numerous witnesses, returned a verdict of "Died from natural causes." It is said that both the prisoners were in easy circumstances, and that the only explanation of their crime at present offered, is the circumstance that deceased's husband settled his property upon her, but with the restriction, that should she marry again, the property was to go to his children.

Liverpool.—A young woman, the wife of a painter named Wilbraham Buckley, residing at St. Helen's, was murdered on Sunday night near Comb Shoprow, on the Liverpool road. From circumstances which came to light there were reasons for suspecting her husband as the perpetrator of the crime, and he was accordingly taken into custody to await the result of the inquest. These suspicions have since been confirmed by the prisoner himself, who has confessed his guilt, and has been committed to take his trial on the charge of Wilful Murder.—The subscriptions in this town to the "Great League Fund" at present amount only to 450*l.*

Manchester.—We recently mentioned, as a proof of the state of this town, that the collections in the Zoological Gardens were to be sold by auction. The sale commenced last week, and was numerously attended. It lasted for three days; the animals realised good prices, and the principal lots were purchased for the London Zoological Gardens. The gross amount of the three days' sale, exclusive of the elephant (which was bought in for the company at 250 guineas, and is still on hand), is said to be about 1,500*l.*; and the local papers state that, considering the state of the times, this amount exceeded the expectation of the directors.—The New York papers received by the last packet state that Mr. Burdekin, the absconded manager of the Manchester Bank, was seen in Albany a few days after the arrival of the Britannia, by an English gentleman who knew him well. It is added that no speech or token of recognition passed between them, and that he could not long escape apprehension, as he would be captured and restored to the English authorities by virtue of the recent treaty.—A fatal accident happened on the 23d ult., at the paper mills of Mrs. Crompton, at Collyhurst, in consequence of the exposed state of the machinery. It appears that Mrs. Crompton was engaged in preparing the work for one of the calenders, when a female servant came into the room to deliver a message, and her clothes were caught by the machinery. Mrs. Crompton ran to her assistance, but was also drawn under the wheel, and her arm torn from her body. The girl was instantly killed, every bone being broken, and her body cut completely in two. At the inquest evidence of the occurrence was given, but there was no proof of blameable neglect, except that the wheels might have been partitioned off. The jury found that the deceased died from lacerations and fractures accidentally received from a cog-wheel, stating that had it not been for the injuries received by Mrs. Crompton in trying to extricate the deceased, they should have imposed a deodand on the machinery.

Nottingham.—A great meeting of the magistrates of this county, at which upwards of forty were present, took place at Southwell last week, to consider the propriety of increasing or abolishing the Rural Police force. The Earl of Lincoln presided. An increase was carried by 11 to 12, all the rest refusing to vote. The new force is to consist of a chief constable, four superintendents, five inspectors, and 72 policemen. The chief constable's salary is to be 300*l.* per annum, instead of 250*l.*, as heretofore; the superintendents to be commuted, and to be allowed

40*l.* a-year to purchase and keep a horse, in addition to their former salary of 75*l.* per annum, and to enter into security for the accounting for any county money they may receive.—It is said that the manufacturers in Nottingham and Derby are endeavouring to bring out coats and trowsers woven in the frame, and that ultimately it is expected they will accomplish their purpose.

Oxford.—The contest for the vacant office of Public Orator at the convocation on Thursday the 24th ult. terminated in the unanimous election of the Rev. W. Jacobson, Vice-principal of Magdalen Hall. The Rev. G. H. S. Johnson, Fellow of Queen's, has been elected Professor of Moral Philosophy. This Professorship, which becomes vacant every fifth year, was founded by Dr. White, in 1621, and endowed with a salary of 100*l.* per annum.

Sunderland.—On Monday last, the shipowners of this port had a meeting for the purpose of inspecting the plans and hearing the explanations of a project, suggested by Mr. Murray, the engineer, for converting Sunderland harbour into a floating dock. The meeting, which was numerously attended, approved of the measure proposed. The commissioners intend to apply to Parliament in the next session for carrying this improvement into effect, which promises to be of consequence to the shipping interest. It is proposed to place a dam of piers of masonry, with navigable gates, across the harbour, and to form a tidal basin for the reception of vessels which enter the harbour at low water. By these means vessels will be enabled at all times to float into the harbour, and by means of sluices the channel will be deepened and the navigation generally improved. The estimated cost of this undertaking is from 50,000*l.* to 60,000*l.*, which the commissioners, it is understood, intended to borrow, either of the Public Loan Commissioners or from individuals. The interest of this money and the general expenses are intended to be defrayed by a tax on shipping, and timber and other articles unloaded in the port. It is expected the works will be completed at the close of 1844, or the beginning of 1845, if the act be not opposed. Many shipowners state that had this improvement been carried into effect some years ago, a great portion of the trade which has now gone to Hartlepool, Middlesborough, and Seaham, would have been retained in Sunderland.

Thetford.—During the last week a solicitor of this town, hitherto considered of the highest respectability, has absconded, leaving liabilities to the amount, it is supposed, of 20,000*l.* He had appointed Friday last for meeting some heavy mortgage accounts, and for handing over the amount for a farm which he had recently purchased, and his non-appearance on that and the following days led to the discovery. His absence has created a panic in this part of Norfolk, as from his extensive transactions in mortgages, conveyances, and other monetary matters, it is impossible to calculate at present the extent of his defalcations.

Wakefield.—The election of Registrar for the West Riding of York took place last week, and caused unusual interest in the county from the spirit with which it was contested. The candidates were Mr. T. B. Hodgson, and the Hon. Mr. Lascelles. The polling commenced on Tuesday, and promised a favourable result to Mr. Lascelles, who had a majority on the second day's poll. On the third day, however, his opponent caught him up, and at the close of the poll it was found, contrary to general anticipation, that Mr. Hodgson was elected. Nearly 3,400 voters had then polled.

Worcester.—The mail from this city to Ludlow, after running for half a century, made its last journey on Tuesday week, thus leaving the public without any official conveyance for letters between Worcester and Tenbury.

Railways.—The following are the returns of the undermentioned railways for the week :—London and Birmingham, 13.808*l.* ; Great Western, 10,589*l.* ; South-Western, 5,168*l.* ; South-Eastern, 1,112*l.* ; Brighton, 3,167*l.* ; Blackwall, 455*l.* ; Greenwich, 692*l.* ; Croydon, 208*l.* ; Grand Junction, 6,451*l.* ; Eastern Counties, 794*l.*; North Midland, 3635*l.* ; York and ditto, 1,465*l.*—A statement of the prospects of the Great Western Railway, for the half-year ending on the 31st, has been drawn up, in anticipation of the actual report to be submitted to the shareholders for that period. From this document the prospects of the undertaking appear to be still improving. The receipts to July 31st were 71,400*l.* ; to August 28th, 59,270*l.* ; to September 25th, 57, 251. ; to October 30th, 69,401*l.* For November, to the 27th, they are estimated at 46,000*l.*; and for December, down to the 31st, at 60,000*l.* These sums, including a surplus of 2,605*l.*, carried over from the June account, make a total of 365,927*l.* The expense of working the line and its branches is taken at 125,000*l.*, being about 3,000*l.* less than was paid last half-year ; the rent of the Cheltenham line at 8,500*l.*, rent and toll of the Exeter line at 24,000*l.*; the interest on capital borrowed, being 3,472,409*l.*, at five per cent. per annum, at 86,810*l.*, but from which is rebated, for interest on money in hand, 6,810*l.* ; the dividend on shares, namely 3,015,013*l.*. at eight per cent. per annum, at 120,600*l.* The total of expenditure is, therefore, assumed to be 358,100*l.*, which leaves a balance to be carried to the next account of 7,827*l.* It is generally supposed that these calculations will be fully realised at the end of the year.—We mentioned in our last that the special meeting of the Midland Counties Company, following the example of the North Midland, had appointed a committee to inquire into present and past expenditure ; these examples seem to have directed the attention of shareholders generally to the necessity of reductions in the expense of working ; and it is now announced that the Preston and Wyre Company, acting on this principle, is to be henceforth managed by a local board, and that the London direction, with its offices and attendants, will be dissolved. Several directors of the North Midland Company have sent in their resignation since the late meeting, and the members of the committee which reported on their affairs will, it is understood, replace them.—The long-pending dispute between the Greenwich and Croydon Companies is likely to be brought to an unexpected issue, the directors of the Croydon line having officially given notice to the Greenwich directors that unless they come to terms, they will recommend to the proprietors to abandon the traffic in consequence of the heavy tollage exacted from them by the Greenwich railway. This result will no doubt cause serious inconvenience to the public, and at the same time entail disastrous effects on the Greenwich Company. If the threat be carried into execution, it is supposed that the directors of the latter company will find it necessary for their own safety, either to purchase the Croydon line, or take it on lease.—Another portion of the London and Dover Railway, from Headcorn to Ashford, was privately opened on Monday by the directors, the Government Inspector, and their friends, and was thrown open to the public yesterday.

IRELAND.

Dublin.—The judgment respecting the Deanery of St. Patrick's, which was expected to be given on Monday by the Court of Delegates, is again postponed. Mr. Justice Crampton intimated that the Court would adjourn till next week, when judgment will be given. It is understood that the Judges are divided on the question, but that the majority is in favour of Mr. Daly.—The Lord Chancellor has pronounced the final decree in the important case of the Attorney-General *v.* Drummond, which involves property to the amount of about 700*l.* a year, created in trust, in the year 1710, by Sir A. Langford and other orthodox Presbyterians, for the support of poor congregations connected with their church, and for promoting, by other means, the extension of Presbyterianism, especially in the neighbourhood of Dublin and the south of Ireland. The original trustees were representatives of the different Presbyterian congregations of Dublin, consisting of their ministers and elders ; but towards the close of the last century some of the successors of the first trustees lapsed into Unitarianism, and they, forming a majority, applied the greater portion of the funds for the promotion of Unitarian doctrines. In last Hilary Term Mr. George Matthews, and other relators in the case, laid informations against the trustees for misapplication of the funds, and applied to the Court to direct that they should be applied according to the intention of the original donors, excluding Unitarians from all participation of it, and also for the removal of the Unitarian trustees from the administration of the fund. The arguments in the case occupied the Court four days in Hilary Term ; at the conclusion of which his Lordship gave judgment in favour of the relators, excluding the Unitarians from all participation in or administration of the trust—reserving, however, the final decree until after the decision of the House of Lords in Lady Hewley's case. His Lordship now gave a final decree, excluding the eleven Unitarian trustees, and the four Trinitarians who had joined with them in the answer, and referring the question of costs, which he considered all the parties in the case, together with the relators, should be allowed, to the Master, and also the appointment of Trinitarian trustees, in the terms of the judgment given by the House of Lords in Lady Hewley's case, in the place of those whom he removed.—A professsorship of civil engineering has been established at Trinity College ; and Mr. Macniell, a pupil and assistant of Mr. Telford, and his successor as engineer of the Holyhead road, has been elected to the chair.

Skibbereen.—An inquest has been held on the two men killed by the police in the fatal contest respecting poor's rates noticed in our last. In one case they returned a unanimous verdict of justifiable homicide, being of opinion that Mr. Gore Jones was justified in giving the order to fire. In the other they brought in a verdict of manslaughter, considering that under the circumstances the police were not justified in firing on an unoffending party in the rear. This verdict was signed by sixteen jurors, four others having been in favour of a verdict of justifiable homicide, and two for a verdict of murder. The foreman of the jury, in submitting this result, said they deemed it right that it should be known to the country that they had ever looked upon that district as one of the most peaceable and quiet of all Ireland, and did so up to this melancholy transaction. They were sorry that bad advice should have been given to the misguided people by persons in a superior rank of life, for if that mischievous advice had not been received, the jury would not then have been placed in their painful position.—In connexion with this subject the papers state that the disposition of the rural population in some districts to resist the payment of poor's rate continues to excite a good deal of anxiety. The depot of the 35th Regiment, stationed at Carrick-on-Suir, were ordered to be in readiness a few days since to attend the collectors, and a party of the 7th Dragoon Guards, quartered in Clonmel, were to move to Carrick to assist.

Carlow.—In consequence of disclosures made during a recent investigation into the affairs of the Lunatic Asylum in this city, Mr. M'Caffrey, the manager, and three of the attendants, have been dismissed. This resolution has proceeded from the Government, and the Lord Lieutenant has directed the Governors of the asylum to carry it into effect.

Tipperary.—Another melancholy tragedy has occurred in this county. Mr. James Scully of Kilfeacle, a magistrate and grand juror of the county, has been murdered on his own estate and almost within sight of his house. Mr. Scully was fired at last spring, whilst reading in the parlour of his residence, and was so dangerously wounded that his life was for some time despaired of. On Saturday last, he went out duck-shooting in the morning, accompanied by a brother, and, on their return home, the latter separated from him, as Mr. Scully expressed a wish to have a few more shots, adding, at the same time, that he should return in time for dinner. An hour having passed away without his coming, the family became alarmed ; and messengers having been despatched to ascertain what had become of him, they found the ill-fated gentleman a corpse, not far distant from the spot where he had separated from his brother, a ball having passed through his heart ! He was in the prime of life and possessed of a considerable and unincumbered property, which passes by his death to his brother, Mr. V. Scully, barrister, of Dublin. This determined assassination is attributed to the circumstances arising from the dispute which led to the first attempt. It appears that one of Mr. Scully's tenants sold his farm for 80*l.*, with the intention of emigrating to America. The new tenant newly cropped the land ; but after the lapse of some months, the former occupier, who remained in the mean time amongst his relations on the estate, came back and claimed the farm. The new tenant consented to give it up, on being paid his 80*l.* and the value of the crops in the ground ; but these very fair terms were rejected, possession being required without any compensation or equivalent. In these circumstances, Mr. Scully was appealed to, and of course decided in favour of the occupying tenant. Soon after shots were fired into the tenant's house, and he was otherwise annoyed, it was supposed, by the old tenant and his relations. Mr. Scully then interposed, threatening to get rid of those persons, if the system of outrage were persevered in. The result was, the formation of a conspiracy against Mr. Scully himself—he was soon after fired at and wounded, and now, after his return from the Continent, and the re-establishment of his health, he has been murdered, in obedience, no doubt to the resolution of some secret combination. The Government have issued a proclamation offering a reward of 200*l.* for the discovery of the murderers, and a free pardon to any accomplice, not being the actual murderer, who will prosecute to conviction the persons concerned.

SCOTLAND.

Edinburgh.—The Convocation of the Non-Intrusion Clergy terminated its labours on Thursday week, on which occasion a public meeting was called in Lady Glenorchy's Church. A very large assemblage attended, the body of the church being principally occupied by the ministers and the elders. The sittings of the convocation being private, a variety of statements were circulated as to the nature of the proceedings. The meeting of Thursday was called in order to afford the convocation an opportunity of explaining the course pursued. Dr. Clason intimated that 479 ministers had attended the convocation, and that in general great harmony had obtained. There were two sets of resolutions proposed ; for the first of which 427 voted, and the second was carried with equal unanimity and cordiality. Dr. Candlish, in the course of a long speech, referred to these resolutions, and said—I hold in my hand the two sets of resolutions to which Dr. Clason has referred. But I shall not now trouble the convocation, or the meeting assembled, to sympathise with us ; I shall not trouble the meeting by reading these resolutions ; they are somewhat long, and they will be more calmly considered by our friends and brethren when reading them at their leisure ; but I may take leave to state what I understand to be the substance of these two sets of resolutions, which, taken together, bring out clearly and consistently our testimony to a great scriptural truth in relation to the connexion or alliance between the Church and the State. If I were to characterise these two sets of resolutions, testimony is borne by the brethren to the duty of the Church, as Christ's house, to acknowledge the authority of Christ, and of Christ alone ; and that, in the second set of resolutions, testimony is borne to the duty of the civil magistrate as bound to acknowledge Christ and to protect Christ's servants. The first set of resolutions, then, testifies as to the duty of the Church as subject to the authority of Christ alone, and, therefore, bound to resist the servitude of every other master. The duty is clearly set forth in the declaration that the Church cannot recognise the authority of the civil courts, or even of the supreme power of the state, the legislature, or the country ; that the Church cannot recognise the authority of the civil magistrates as binding upon her conscience in matters spiritual—as laying her under any obligation to act contrary to her own conviction of duty—these convictions being founded on the word of God alone. The particular matters referred to, in which the Church believes that her spiritual province has been invaded, are glowingly set forth in these resolutions. They refer to the various encroachments made on the spiritual province by the civil courts, in reference to the admission of ministers—in reference to the deposition of ministers—in reference to the general exercise of discipline—and, in particular, to the precise bearing of the recent judgment in the Auchterarder case.—Some time since we mentioned a report that the Government had it in contemplation to remove all the dilapidated buildings which harbour round the ancient Palace of Holyrood, to beautify the Royal Park adjoining, and to change the hereditary keepership. This report we find by the *Caledonian Mercury* is borne out by a notice of an intended application to Parliament to enable the Commissioners of Woods and Forests to carry out the proposed arrangement, and there is no longer any doubt that the grounds, including a portion of Arthur's Seat and Salisbury Craggs, will be planted and laid out with proper and convenient walks.

Berwick.—Since the close of the fishing season there have been two or three seals seen in the Tweed. One in particular took up his residence nearly opposite to South Bells Fishery, where he has been intercepting the salmon on their passage to the upper parts of the river. The bailiffs hearing of the depredations committed by this novel poacher, sent out a party in pursuit, and after a chase of several hours they succeeded in shooting him. On being brought to shore he was found to weigh upwards of a hundred weight.

Perth.—We learn from the *Perth Constitutional* that a site for the new episcopal college has been finally fixed upon; and although it is not in the immediate vicinity of the city, it is within so short a distance, that almost all the benefits will be derived by the city that could have been expected, even had the college been planted in the suburbs. The site fixed upon is on the lands of Cairneis, belonging to Mr. Paton, advocate, who made a gratuitous offer of sufficient ground for the purpose; and this site was unanimously preferred by the committee. It stands on a good elevation, and commands an extensive prospect, and is in every respect suitable for the purpose.

THEATRICALS.

Covent-Garden.—The affairs of this theatre, to which we briefly alluded in our last, are now arranged on the plan then mentioned as probable. Mr. Kemble has retired from the management, and Mr. Bunn is formally installed as his successor. It appears that the change was altogether unexpected, and that Mr. Bunn was perfectly unconscious that any alteration in the management was about to take place. Upon the proposition being made to him by the proprietors to assume the management, Mr. Bunn is stated to have said, that nothing would induce him to be a party to any proceeding that could be regarded of a coercive character towards Mr. Kemble. He was assured that nothing was more remote from the intention and disposition of the proprietors, and the lesseeship was again offered to him. It was necessary, however, to consult Miss A. Kemble, and Mr. Butler, who acted as the representative of the Kemble family in the affair, proceeded to Brighton to consult her. On Saturday the performers assembled to hear the result, the proprietors having previously intimated that, as they had received no portion of the usual rent (35*l.* a night) during the present season, they would only consent to take 20*l.* nightly from the doors until Christmas, on condition that if any surplus remained on hand after payment of salaries, it should go to make up the deficiency of the 35*l.* nightly rent. This of course rendered it necessary for the actors themselves to make a sacrifice, and upon Miss Kemble's answer their future proceedings mainly depended. In her reply on this subject, she stated that "nothing should induce her to put the company in a difficulty—that she would cheerfully make herself one of them—that she would take her salary subject to the receipts—that she would be the last paid—and that, if there was not enough, she would play for nothing." The company immediately said they were satisfied that the mere fact of her appearing on the stage for the last time would draw houses that could not fail to cover all the expenses of the management; but under any circumstances, imitating her example, they would readily take their risk in the receipts of the house. The whole of the company then signed an agreement to this effect, and the house consequently re-opened on Monday under the management of Mr. Bunn, and was very fully attended. On Monday Miss Kemble appeared in "Semiramide," and was loudly cheered, the audience appearing to appreciate her sacrifices for the interests of the theatre. It is stated that the duties of the lesseeship have operated most prejudicially upon Mr. Kemble's health, and that his physicians had given an unfavourable opinion as to the probable consequences of a continued performance of them. It is said that ill health has prevented Mr. Kemble's attendance at the theatre during the last six weeks.

Haymarket.—A new farce, called, "A Cure for Love," was produced at this theatre on Tuesday with complete success. The principal characters are *Felix Trimmer, Esq.* (Mr. Farren), a henpecked husband, who is impelled by his conjugal miseries to seek refuge in the Serpentine; and a miserable lover, *Mr. Sadgrove* (Mr. Buckstone), who, after wandering over the Continent for 9 years to soothe his disappointed affections, returns to England, and settles his affairs, that he may enjoy the pleasure of a similar plunge. By the side of the stream they meet, and, after trying to elude each other for some time, fancy the coast is clear, and rush simultaneously to the fatal bank. They mutually prevent suicide, become friends over a bottle, and the married unfortunate asks his new acquaintance to his house, where it is discovered that the very lady (Mrs. Raymond) who prompted her husband to commit suicide, is the fair one whose loss drove the sighing lover to attempt the perpetration of a similar act. *Mr. Sadgrove* is, of course, brought to his senses by this practical demonstration of his excellent luck in having avoided such a match. *Mr.* and *Mrs. Trimmer* make praiseworthy resolutions to lead a happier life for the future; an arrangement at which *Mrs. Major Browne*, the lady's mother, and *Miss Bitterton*, an old maiden aunt, excellently played by Mrs. Glover, are exceedingly discontented. At the close of the piece, Mr. Farren announced it for repetition amidst general demonstrations of satisfaction.—Mrs. Fitzwilliam's name has disappeared from the bills of this theatre during the week, in consequence, it is said, of an undue interference on the part of Madame Vestris, who had induced the manager to postpone the pieces in which Mrs. Fitzwilliam appeared to such a late period of the performances, that she felt it necessary to throw up her engagement.

Miscellaneous.

New Microscope.—On Wednesday last a new microscope, constructed by Mr. Cary, the optician, for the Polytechnic institution, was privately exhibited preparatory to its being added to the other attractions of that popular establishment. The effects are produced by the agency of the oxy-hydrogen jet playing on a piece of quicklime, familiarly known as the Drummond light. The microscope consists of 6 powers, ranging from 130 times to 74,000,000 times. The second power magnifies the wings of the locust to 27 feet in length. The fourth power magnifies the sting of the bee 27 feet. By the sixth power, the eye of the fly, which is said to contain 750 lenses, is so magnified that each lens appears to be 14 inches in diameter; the human hair is magnified 18 inches in diameter, or 4ft. 6 in. in circumference. Nothing can exceed the beauty with which insect architecture is developed under the influence of this enormous power; the condensing lens is 9½ ins. in diameter.

Storming of Chin-Keang-foo.—The following account of this military achievement, the last probably which we shall have to record in connexion with the Chinese expedition, will no doubt interest our readers. It consists of extracts from a letter addressed by an officer to the *Bombay Times*:—"The storming and capture of Chin-Keang-foo on the 21st inst. has been one of the most important, as it has been the most sanguinary, engagement we have yet had in China. The city is situated on the western bank of the river Yang-tse-Keang, near its intersection by the Grand Canal, about 40 miles below Nankin. The fleet arrived off the town on the 20th, and the troops were landed next morning. It has been almost entirely a military affair. The troops were divided into three brigades, which attacked the town at different points. As little or no resistance was anticipated, the services of the naval force were considered unnecessary, with the exception of one shelling steamer; and it was the envied post of the Auckland to co-operate with the Royal Artillery in effecting a breach in that part of the wall which overlooks and commands the river, for the entrance of the centre brigade. The wall which surrounds the town is built of brick, about 25 or 30 feet high. It is very abundantly supplied with bastions, embrasures, port-holes, &c., and was fortified with 12 and 6-pounder pieces, and jingals. That part of it which is nearest the river (about a quarter of a mile from it) extends over a rising ground of considerable elevation and steepness, and has a strong and fort-like appearance. On this point the Auckland, and Rocket Corps of the Royal Artillery which was stationed on a hill close adjoining, opened their fire at ten o'clock, and it is merely necessary to state, that the appearance of the wall afterwards gave ample evidence of the manner in which they performed their task. Time, however, was not allowed them to make a breach in the wall; their fire had been maintained and returned with spirit for about half an hour, when the advance of the Sappers and Miners with three ladders, followed by her Majesty's 55th Madras Rifle Brigade, and 2d and 6th Regiments of Madras Native Infantry (which composed the whole of the centre brigade), was the signal for them to cease firing. The ladders were planted with magic rapidity, and the grenadier company of the 55th (who were, properly speaking, the forlorn hope), commenced their dangerous ascent under cover of a close fire from the Rifles, who were stretched on their fronts on the face of the hill, picking off every man who showed himself at the embrasures; from which, however, the enemy kept up a very deadly fire for some minutes, and a good many of our men fell dead and wounded. The first man who reached the top of the wall was Lieut. Cuddy, of the grenadier company of the 55th; he behaved with matchless gallantry: slowly but firmly he climbed the ladder. On reaching the top, he waved his sword, and then deliberately seated himself on the wall and assisted his men over. At this moment the anxiety and interest which was felt by every one for his safety, who witnessed his daring conduct, was intense. I could scarcely breathe! It was more than miraculous that he was not shot dead or hurled from the wall; it was like a man jumping into his own coffin! He was severely wounded in the foot by a jingal ball while on the wall, which disabled him for the rest of the day. In about a quarter of an hour the ensign of England and the colours of the 55th were shown from the wall, which was responded to by three hearty cheers from the fleet: but though the colours were shown, the place was by no means taken; on the contrary, they had the greatest difficulty in driving the enemy from the walls. The Tartars fought with great bravery, made repeated charges on our men with their long spears, and disputed every inch of ground. The British bayonet, however, at length prevailed. They returned to the town and took shelter in the houses, from which they kept up a most deadly and harassing fire; our troops were fired at from all quarters, without being able to see from whence it came; and it was not until they made a general charge, and closed in upon the houses, that they were able to return the fire with any effect. This destructive firing was protracted for five or six hours, or, indeed, I may say, for the rest of the day, till darkness favoured their escape from the walls or gates, from which they were allowed to pass out without hindrance, excepting such as bore arms, or gave other evidence of their being soldiers. It is discipline, not courage, that the enemy want. Instances of the most desperate and devoted bravery were common throughout the day; and some of their leaders, in particular, when they found that the day was against them, were observed to spur their horses against our bayonets, and thus court their death. I walked through a part of the town next day with an escort. It was almost entirely deserted—at least, no further resistance was offered by its now terror-stricken inhabitants. I need not say that the most disgusting sights met the eye at every step. The dead and wounded of the enemy (although most of them had been carried away) were lying about in all directions, no attention whatever being paid to the latter. Already had the houses and shops been broken open, and the most valuable property, as teas, bales of silk, furs, &c., was scattered about like rubbish. All the houses which were supposed to have any connexion with Government or Government officers were either burnt or being burnt. As at other places we have taken from the Chinese, suicides were committed to a fearful extent—men, women, and children were found strangled, or taken out of the wells by dozens. The natives are very kind to us, and have been so all along. They occasionally bring us presents of vegetables, &c. Their vegetables are very fine. They have excellent brinjals, French beans, celery, cucumbers, &c.; for these they won't take payment, unless it be a slip of paper with 'British protection' written upon it, which they are all very glad to get.—The Yang-tse-Keang is a most noble river: at its lower part the navigation is rather difficult (at least we found it so, having no previous knowledge of its channel) on account of sandbanks—but for forty miles below that it is very deep, and here, off Tchang-Keang, where it is about a mile and a half broad, it is only at certain parts that anchorage can be found for the ships. The current, at the springs, is rapid—more than a six-oared gig can pull against.—The weather is now about the hottest—the thermometer averaging, *in the shade*, from 84 to 90 degrees Fahrenheit, and I have only once seen it above 90. We shall have it hot till the beginning of October, and after that we shall be beginning to have our clothes lined with furs—in the winter season, I am told, the cold is sometimes 16 degrees below zero. The country on the western bank of the river is in some parts picturesque and beautiful; that on the eastern bank is a dead flat, and marshy."

Law.

Privy Council.—The judicial committee of the Privy Council held their first sitting after Michaelmas Term, on Monday, when the following members were present:—Lord Campbell, the Bishop of London, Sir S. Lushington, and Sir J. L. Knight Bruce.

Head v. *Sanders.*—This was an appeal from a decree made by the Dean of Arches, and was originally a cause of office, promoted under the Act of the 3d and 4th of her present Majesty, c. 86, intituled "An Act for better enforcing Church Discipline," in virtue of letters of request under the hand and seal of the Bishop of Exeter, against the Rev. H. E. Head, rector of Feniton, Devon, to answer certain articles exhibited against him, "touching and concerning his soul's health, and the lawful correction and reformation of his manners and excesses;" and more especially for having published a letter in the *Western Times*, on the 21st August, 1841, maintaining that the "catechism," "the order of baptism," and "the order of confirmation," in the Book of Common Prayer, contain "erroneous and strange doctrine," and which said letter also contained other statements "in derogation and depraving of the said Book of Common Prayer." Sir J. Dobson, Queen's Advocate, and Mr. Cockburn, Q.C., appeared in support of the appeal, and contended that the decision of the Court of Arches in favour of the respondent must be set aside—first, on the ground that the letters of request were issued at an improper time, notice having been given by the Bishop to the appellant, according to the third section of the Act, that he intended to issue a commission of inquiry into the offences alleged against the appellant; and having given such notice, he was bound by the 13th section of the same Act to receive the report of the commissioners, that there was sufficient *primâ facie* ground for instituting proceedings, before he could send the cause, by letters of request, to the Court of Appeal of the province. This he might have done, in accordance with the same section, "in the first instance;" but if he once took any step towards issuing a commission, he must receive the report of the commissioners, and then, in the exercise of his discretion, determine the case, or send it up to the Court above. The notice which the bishop had sent to Mr. Head as to his intention to proceed by commission under the provisions of the Act of Parliament, was equivalent to a citation binding the bishop to carry it out to the fullest extent; in point of fact, the notice, as in the case of Ray and Sherwood, was the commencement of a suit, and the bishop could not have two suits for the same offence pending at one and the same time. Secondly, That the letters of request were wrong in point of form, because it did not appear at whose suit the cause was originally instituted, nor by whom, or on whose application or complaint (as required by the act) the appellant was in the first instance charged. It must, therefore, have been by the bishop himself, "of his own mere motion" (as the words of the Act have it), and he, therefore, was bound to go on with it, and could not make Mr. Ralph Sanders his nominee. Was the Bishop to promote a suit of this kind, withdrawing himself from all the moral responsibility which it involved? And, thirdly, it appearing, therefore, by the letters of request, that the bishop had sent the case to the Court of Arches "of his own mere motion," as if he was the party promoting the suit, the letters of request set forth, at the conclusion, the name of the respondent, Mr. Ralph Sanders, as the complaining party, which was irregular. On these grounds the learned counsel contended that the judgment of the court below must be set aside. Dr. Addams, on the part of the respondent, submitted that the notice was made imperative on the bishop, by the 3d section of the Act, previous to issuing the commission, but the commissioners were never appointed; no further proceeding whatever was taken on this notice, and yet it was contended that there was a pending suit. If the commission had issued, then the objection as to the time of sending the case to the Court of Arches might apply; but as the bishop had not proceeded in accordance with the notice, it could not. As to the 13th section of the Act, which enacted that it should be lawful for the bishop, "in the first instance," if he thought fit, to send the case, by letters of request to the Court of Appeal of the province—what did "the first instance" mean? It was a mere technical term, and would apply to the first step in the proceedings. He could not have sent up these letters of request, it was true, if the commission had issued, until the commissioners had made their report; but he could do so at any time prior to the issuing of the commission, notwithstanding the notice which had been given. The Bishop of London: Is it necessary that the commission should issue after notice has been given? Dr. Addams: I apprehend not, my Lord. The Bishop of London: I can imagine that in the first instance a bishop may hear unfavourable rumours respecting a clergyman in his diocese, and send him notice of his intention to issue a commission of inquiry; but he may afterwards receive information which gives the case so grave a complexion that he may think it better at once to send it to the Court of Arches. May he not, then, alter his mind, and dispense with the commission? Dr. Addams: I apprehend he may, my Lord. If the commission had been issued, he could not do so until the commissioners had reported that there was sufficient *primâ facie* ground for instituting proceedings. I understand the object of the Act in that particular to be, that a bishop shall not have the power to put one of his clergy on trial before commissioners, and then take the matter out of their hands before they have come to any decision, and carry it before another tribunal; but here the commission had not issued at all. They stand merely on technical grounds, and on these mere phrases of the Act of Parliament they contend that the proceedings are null and void. Lord Campbell: How would the party who had received notice from the bishop, and against whom these letters of request had also been filed, know that it was for the same offence? Dr. Addams: By the terms of the notice and letters of request, my Lord. This is clearly the same offence; of that there can be no doubt. The learned advocate then went on to contend that it was not necessary, according to the 13th section of the Act, that the name of the party instituting the proceedings in the Court of Arches should appear in the letters of request. Sir S. Lushington explained the mode of procedure previous to the passing of the Act. If a bishop was determined to proceed by letters of request, he selected any person whom he pleased in his name to make a request to the chancellor of the diocese, and then the cause proceeded, not as the cause of the bishop, but of the party appointed. After a few other observations from Dr. Addams, Sir J. Dobson replied; and the court deferred its judgment.

Vice Chancellor's Courts. [Before Vice Chancellor Knight Bruce.]—*Barry* v. *Hill.*—His Honour to-day gave judgment in this case and said—This is a suit for tithes by the plaintiff, the rector of Brockley, against defendant, the occupier of farms and lands in that parish, and in the adjoining parish of Yatton. The plaintiff asks relief only for the period between Lady-day 1838, and the 31st December, 1841; the former being the period that the composition between the parties had been brought to a conclusion in consequence of notice given by the plaintiff; and the latter being the period at which the statutory commutation of tithes took effect in the parish of Brockley. The main dispute is as to Yatton, with respect to which the plaintiff claims upon an alleged series of fraudulent removals of stock, &c., made by the defendant from Brockley to Yatton, with the view of depriving him of his tithes. These removals, made by the defendant, have formed the subject of evidence; and how does that evidence stand? If it is alleged and proved that these were fraudulent removals; that the tithe-owner is unquestionably entitled to relief is a proposition which cannot be denied. (His Honour then went at great length through the evidence, commenting on it as he proceeded.) Independently of any case of fraud, I cannot, having regard to the utmost that could be obtained, and to the evidence, conceive that in May, 1840, there was a good and substantial reason for filing a bill under which more than twenty witnesses have been examined. Making every allowance for the probable heat and exaggeration which prevailed in a parish where such things were done, I am sorry that the wish which I entertained has been left ungratified, of approving of the whole line of conduct which the rector has adopted. But neither with respect to the removals am I so altogether satisfied of the singleness of the defendant's views as I could wish. Making every allowance for human infirmity in a case in which a layman—a yeoman most probably not highly educated—considers himself opposed in a litigation for what he believed to be his right—for such certainly has been the defendant's impression—it is impossible not to disapprove of the nature of some of the notices which were given for setting out the tithes. It is impossible not to disapprove of the treatment which the tithe collector received on the farm. Whatever reason might operate, the plaintiff had a clear title to take his tithe in kind; but the course which he adopted was not a softening one, or one not unlikely to lead to a collision. Wherever the error began, the usual fate has attended the parish and the rector. I declare, therefore, that there shall be no costs on either side up to the present time; but acting on the defendant's consent, I decree an account to the plaintiff of all the tithe in respect of which his counsel at the bar asks for an account. I repeat that I do not consider the case of fraud as proved against the defendant, and saying "by his consent," is not understood by me, and ought not to be understood by any one, as an admission of fraud on his part. The defendant must have liberty at any time before the Master's report to make such offer to the plaintiff, as he may be advised; the Master to state such offer, and whether it had been accepted or not.

Central Criminal Court.—These sessions being the first during the present mayoralty, commenced on Monday morning before the Lord Mayor, the Recorder, and the usual civic authorities. In his charge to the grand jury, the Recorder said, from the appearance of the calendar he was apprehensive that the cases to be submitted for their investigation would not fall short of 300, comprising two cases of murder. The trials which have occurred during the week have been very numerous, but they present no feature of general interest.

SPORTING.

TATTERSALL'S, Thursday.—This was so near being a blank day that it would be useless to make a quotation of prices; the only bets made were—500 to 10 agst. Sir G. Heathcote's Amorino, 1000 to 15 agst. Lord Exeter's Lucetta colt, and 1,000 to 10 each agst. Mr. Bell's Blackdrop, Lord Westminster's Languish colt, and the Duke of Grafton's Pastille colt.

MARK LANE, Friday, Dec. 2.—There was no Essex Wheat left on the stands, but a few parcels remained over from Monday of Kent and Suffolk, which were disposed of at that day's prices. Foreign was held firmly at the same rates, which curtailed the sale; if a trifling reduction had been submitted to, a fair quantity might have been sold.—Barley was a very dull sale at rather below Monday's quotations.—Peas and Beans are unaltered, and the Oat Trade remains in much the same state.

BRITISH, PER IMPERIAL QUARTER.			s. s.		s. s.

GAZETTE OF THE WEEK.

BANKRUPTCIES SUPERSEDED.—J. Brown and G. Meakin, Wallsall, Staffordshire, ale-merchants—G. Forster, Newcastle-upon-Tyne, woollen-draper—R. F. Watkinson and W. Haigh, Huddersfield, Yorkshire, woollen cloth merchants—J. Lang, S. Armitage, R. Redfearn, and J. Sykes, Liversedge, Yorkshire, manufacturers.

BANKRUPTS—T. Rowell, Cambridge, linen draper—T. Feaver, Ludgate-hill, mercer—J. Phillips, Hercules Tavern, Hercules passage, Threadneedle-street, tavern-keeper—M. Edmonds, Park-place, St. James's, boarding-house-keeper—E. Everall, Liverpool, coal merchant—B. Price, Birmingham, genera dealer—S. Appleyard, Manchester, stuff merchant—M. Manwaring, Gornal Staffordshire, grocer—J. Antrobus, Birmingham, plater—W. Heslewood, R Heslewood, and J. Skitt, Kingston-upon-Hull—R. Warren, Liverpool, druggis—J. Cunliffe, Liverpool, coach and cab proprietor—J. H. Chatterton, Nottingham, milliner—W. Thomas, Bristol, tailor—D. Thomas, Manchester, merchant—R. Ellison and J. Goodworth, Barnsley, Yorkshire, linen manufacturers—J. H. Bell, Bristol, apothecary—E. Mansell, Chippenham, Wiltshire, upholsterer—I. Bell and J. Davison, Newcastle-upon-Tyne, earthenware manufacturers—W. Green, Cheltenham, coachmaker—J. Hedgman, High Holborn, dealer in leather—J. Cunnington, Newport, Monmouthshire, builder—T. Jones, Glyn, Merionethshire, cattle salesman—R. Heathcote, Manchester, victualler—B. Thorniley, Broadbottom, Cheshire, grocer—J. Ellis, Mansfield, brushmaker—W. Holt, Mansfield, hatter—T. Marsden, jun., Northallerton, mercer—C. A. Bradbury, Stockport, draper—W. H. Bond, Kingswinford, Stafford, wine-merchant—W. Green, Birmingham, cabinet-case-maker—T. Allen, Macclesfield, silkman and silk throwster—W. Nairn and J. Liston, Tower Royal, Watling-street, Warehousemen—I. Winter, Boxmoor, Hertfordshire—R. Coulsell, Milton, Kent, victualler—T. Fielder, baker—S. Parker, Piccadilly, lamp-manufacturer—Harvey Garnet Phipps Tuckett, Poultry, merchant—T. Caldicott, Newport, Monmouthshire, provision merchant.

BIRTHS—On the 30th ult., in South Audley-street, the wife of Edward Vansittart Neale, Esq., of a son—At East Dene, Isle of Wight, on the 25th ult., the Lady Jane Swinburne, of twins—On the 29th ult., the lady of Col. Gascoigne, Grenadier Guards, of a son—On the 23d May, at Gresford, on the Upper Paterson River, New South Wales, the lady of Constantine Talbot Crichton, Esq., of a son—On the 22d ult., at Clarins, on the Lake of Geneva, the lady of the Hon. Capt. F. Pelham, R.N., of a daughter

MARRIED—At St. Pancras Church, New Road, by the Rev. Dr. Moore, on the 29th ult., Charles I. Axford, Esq., eldest son of C. I. F. Axford, Esq., Swindon, Wilts, to Catherine Emma, daughter of George Waters, Esq., First Judge of Circuit, Tillichery, Madras—On the 1st inst., at Battersea Church, by the Hon. and Rev. Robert Eden, Augustus, youngest son of John Holland, Esq., of Clapham Common, to Elizabeth, eldest daughter of Robert Davies, Esq., of Wandsworth Common.

DIED—On the 23d ult., at Sloperton Cottage, Devizes, after a lingering illness, brought on by the climate, aged 19, Lieut. J. Russell Moore, of the 25th Reg. Bengal N.I.—On the 9th of Oct., at the Island of St. Lucia, in the West Indies, aged 26, Lieut. John Stuart, of the 33d Reg., eldest son of D. Stuart, Esq., of Upper Harley-street—On the 27th ult., at Kirklands of Ancrum, Roxburghshire, the house of her father, John Richardson, Esq., Hope, the beloved wife of Henry Reeve, Esq., of the Privy Council Office, in her 28th year—On the 28th ult., at Feniton Court, Devon, Frances Duke, wife of the Hon. Mr. Justice Patteson, and only daughter of the late James Coleridge, Esq., of Heath's Court, Devon—On the 25th ult., in Lower Seymour-street, Portman-square, in the 71st year of her age, Elizabeth Lady Mostyn, wife of the Right Hon. Lord Mostyn. The deceased lady was the third daughter of the late Sir Roger Mostyn, of Mostyn, in the county of Flint.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BROWN'S IMPROVED GARDEN POT.

ROBERT BROWN having made an important and successful improvement in the construction of Garden Pots, submits them to the Floricultural Profession, and to all who are interested in the propagation and cultivation of Plants. It is well known that many valuable plants are annually lost, or much injured, by having the delicate fibres of their roots dried up, from the pots in common use becoming heated by the sun's rays, or from exposure to drying currents of air, &c., for which evils a remedy has long been sought. The Improved Garden Pot now offered to the Public is intended to counteract this irregularity of temperature, by being made hollow-sided, with an aperture on the rim, that the space between the outer and inner surface may be filled with water when required, and the aperture being made air-tight by means of a peg, a uniform degree of coolness or humidity may be preserved, and the plants, although exposed to the mid-day sun, will have their roots secured from injury. The Improved Garden Pot does not differ in appearance from those in common use, but the advantages of its construction, for the growth of plants, or for the propagation of cuttings, are too obvious to need further comment.—R. B. has submitted his invention to several eminent cultivators, from whom he has received the greatest encouragement.

Specimens may be seen at the Horticultural Society's Rooms, 21, Regent-street, or at Mr. Brown's Pottery, Surbiton-hill, near Kingston, Surrey, and at his private residence, Ewell.

TO FARMERS, GARDENERS, AND OTHERS.—SULPHATE of LIME, now in use by the Horticultural Society, being a cheap substitute for Gypsum, may be had in large or small quantities, at Samuel Carter's, 65, Blackman-street, Borough of Southwark.

CHINESE GARDENING and ARCHITECTURE.—The 15th Number of the "GARDENER and PRACTICAL FLORIST" contains the first of a Series of Articles and Illustrations of Gardens and Garden Building in China, with many other interesting subjects.

London: Richard Groombridge, 5, Paternoster Row.
Sold by all Booksellers and Newsmen.

THE QUARTERLY REVIEW, No. CXLI., will be published on Saturday, the 10th December.

Contents:—I. The Honey-bee and Bee Books—II. Books for Children—III. Brandy and Salt; Homœopathy; Cold-Water Cure—IV. Lord Mahon's Life of the Great Condé—V. Borrow's Bible in Spain—VI. Todd on Antichrist—VII. The Anti-Corn-Law League.

John Murray, Albemarle-street.

Published this day, fcap. 8vo, 5s. 6d. cloth,

A COMPREHENSIVE VIEW of the CULTURE of the VINE, under Glass, from the Embryo Bud to the permanent Bearing of the Plant. By James Roberts.

Dr. Lindley's opinion on specimens of five varieties of Grapes from young Vines two years planted, exhibited at the Royal Hort. Society's Rooms, Regent-street, London, Sept. 7th, 1841: "For size and weight of bunches we should think they have never been surpassed." The large silver medal was awarded them.

"As a plain and practical treatise on the subject, it is the best we have ever met with."—*Wakefield Journal.*

London: Longman, Brown, Green, and Longman.

Now published, price 10s.,

A SECOND Edition of MILL'S TREATISE ON THE CULTURE OF CUCUMBERS, MELONS, SEA-KALE, and ASPARAGUS, with a descriptive Plate of his Pit, and also daily Notes of Practice from December to February inclusive.

Published by Wm. Smith, 113, Fleet-street, and sold by all Booksellers.

GENERAL DRAINAGE, AND THE DISTRIBUTION OF WATER.—The Drainage of Land, combined with the Sewerage of Towns, advocated in a Letter to P. Pusey, Esq., M.P. By J. Bailey Denton. Ridgway, Piccadilly.—Also, by the same writer, Model Mapping considered as Suggestive of Uniform and Profitable Draining of Land, with Directions for Construction.—Weale, Holborn.

WHITE HART HOTEL AND HORTICULTURAL GROUNDS, BROMLEY, KENT.

W. PAWLEY begs most respectfully to call the attention of the Nobility and Gentry wishing to purchase specimens of Stove and Greenhouse Plants for exhibition to his Collection, which is equal and not to be surpassed by any Nurseryman's in the neighbourhood of London. Catalogues of the Stock will be sent Gratis on application. W. P. also begs to state that the above Hotel has an advantage over many, as the apartments open into the grounds, with additional conservatories attached, rendering it in every respect desirable for Families and parties wishing for a retreat at a convenient distance from the Metropolis, where they may ensure every accommodation and comfort upon moderate terms. Bromley is particularly healthy, and beautifully situated in an excellent neighbourhood ten miles from town.

TO PARENTS AND GUARDIANS.

WANTED an IN-DOOR APPRENTICE, where he would be treated as one of the family, a Youth about 14 or 15 years of age, to the Nursery, Plant, and Gardening Business. A moderate Premium will be required.—For Cards of Address, apply at the *Gardeners' Chronicle* Office.

KEENE'S PATENT CEMENT.

THIS CEMENT is harder than any other known, and is especially fitted for the Walls of Hothouses, Conservatories, &c., as it neither cracks nor vegetates, and is perfectly impenetrable by insects.

The entire range of Hothouses erecting by the Government at Frogmore are about being stuccoed with it, and the price ranges nearly equally with the Cements in ordinary use for floors, and it forms a paving harder and cheaper than Portland Stone.

Patentees and Manufacturers, J. B. WHITE and SONS, Millbank, Westminster.

THE PATENT ASPHALTE PROTECTING MATERIAL, spoken so highly of in the *Gardeners' Chronicle* for 1841, p. 100, 415, 530, and p. 8, for 1842, may be obtained in Sheets—32 inches by 32 inches, 32 inches by 64 inches, 32 inches by 96 inches, of Thos. Jno. Croggon, 8, Ingram-court, Fenchurch-street. A liberal discount to Hothouse Builders, Nurserymen, &c.

PATRONISED by all the principal Architects and Builders in this Country and Abroad.——SEYSSEL ASPHALTE.—In consequence of the daily attempts made to imitate this valuable mineral production, and of the name of "Asphalte" being given to most of the spurious and "cheap" materials, the Directors of this Company particularly recommend Architects, Builders, and others, (for the purpose of securing the use of the genuine article,) to insert in their specifications "The Seyssel Asphalte, Claridge's Patent," and not merely "Asphalte" or "Bitumen," as, in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. For the information of those residing at a distance from London, and of those who, having employed the spurious composition, may, from its failure, have become prejudiced against the use of Asphalte, the following are mentioned as some of the distinguishing qualities of the genuine material. The Asphalte of Seyssel is of a light colour, closely resembling Yorkshire stone, has a smooth surface (without being slippery), and joints almost imperceptible; it is also free from smell, is not acted upon by change of temperature, and is at all times dry and warm, and remarkably pleasant to walk upon, and, from its elasticity, never cracks. The fictitious material, on the contrary, has a dark and dirty-looking appearance, presents a rough and coarse surface, and, from its brittleness, is liable to crack, particularly in frosty weather. In consequence of the above qualities, the genuine material (being perfectly impervious to wet) has been used with great advantage for roofing; it can be laid down to any extent, presenting one uniform surface, and is far superior to lead, as it is not liable to expansion or contraction in consequence of any change in the temperature. For covering of arches, (to prevent the percolation of wet,) it is invaluable, the Greenwich Railway Company alone having covered upwards of 400,000 superficial feet; it has also been used on the Great Western, Birmingham, Midland Counties, South Western, Brighton, Blackwall, and other Railways; at the joint Stations, London-bridge, and at the South Metropolitan, Highgate, and Nunhead Cemeteries. As proof of the great durability of the genuine Asphalte, it need only be mentioned that the first work executed in this Country with this material, (amounting to 3,952 feet,) was at Whitehall, opposite the Horse Guards, in the month of April, 1838, and which, although only half an inch in thickness, has remained up to this time (a period of four years and eight months) in the most perfect condition. Books of Testimonials with scale of prices may be obtained on application to J. FARRELL, Secretary.

Seyssel Asphalte Company's Depot, Stangate, London.

Note—Neither the pavement in Parliament Street, London, nor the works at the Model Prison, at the Abney-park Cemetery (which from its failure has since been removed), or at the Hotel at the Slough station of the Great Western Railway, were executed by this Company.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at Worton Cottage, Isleworth, upon application to the gardener—*Sundays excepted.*

TARPAULINS for GREENHOUSES, CAPES, &c.—On SALE, NEW TARPAULIN of thick or thin Canvass, as required, and Waterproof, 2s. per square yard, made up to any size, and particularly recommended for Frames and Greenhouses in the *Gardeners' Chronicle.*—A large quantity of Policemen's second-hand Tarpaulin Capes, lined with Cloth, for Labourers and Farm Servants, at 2s. and 2s. 6d. each. All kinds of Garden, Fishing, and Sheep-folding Nets.—Robert Richardson, Net and Tent Maker, 21, Tonbridge-place, New-road, near Euston-square, London.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. Abbott, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.

City Office, 98, Gracechurch-street.

THE MECHIAN DRESSING-CASE, the most portable ever invented, only six and three-quarter inches long, three and a quarter wide, and three-fourths of an inch deep, the size of a pocket-book, contains one pair of Mechi's ivory-handled peculiar steel razors, his magic strop and comb, badger-hair shaving-brush, his patent castellated tooth-brush, and a neat nail-brush; price only 25s. The same with hair-brush and soap-dish, 35s. To military men, and as a steam-boat or travelling companion, this invention must prove invaluable, the articles therein being of the first quality. An immense variety of other dressing-cases for both gentlemen and ladies, either in fancy woods or leather, at all prices, from 20s. to 30 guineas.—At Mechi's Cutlery and Dressing-case Manufactory, No. 4, Leadenhall-street, London, four doors from Cornhill. An extensive stock of leather writing-cases, work-boxes, bagatelle-tables, razors, razor-strops, Sheffield plated goods, tea-trays, tea-caddies, &c., cheaper than any house in London. Every article warranted; money returned if not approved.

WHITE TEETH. ROWLAND'S ODONTO, or PEARL DENTIFRICE.—This is an efficient White Powder for the Teeth, solely prepared from Oriental Herbs of the most delightful odour, and of sovereign virtue for strengthening, preserving, and thoroughly cleansing the Teeth. It eradicates tartar from the Teeth, removes spots of incipient decay, polishes and preserves the enamel, to which it gives a pearl-like whiteness; and, above all, from its disinfecting properties, gives sweetness to the breath. As an antiscorbutic, the gums also share in its transcendant powers. Scurvy is eradicated from them, and a healthy action and redness are induced, that offer to the notice of the medical practitioner the most indubitable signs of their healthful state. Price 2s. 9d. per box, duty included. *** Notice—The Name and Address of the Proprietors, A. Rowland and Son, 20, Hatton Garden, London, are engraved on the Government stamp which is pasted on each.

*** Be sure to ask for "ROWLAND'S."

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 3, 1842.

THE GARDENERS' CHRONICLE.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

THE GARDENERS' CHRONICLE of December 17th, will contain a Full and Authentic Account of Dr. LYON PLAYFAIR'S Second Lecture on the Application of the Principles of Physiology to the FATTENING of CATTLE.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN for the year 1843. The Exhibitions will take place on the following days: viz., Saturday, May 13; Saturday, June 17; Wednesday, July 12.

EXHIBITORS.

All persons, whether Fellows of the Society or not, will be at liberty to send subjects for exhibition.

DELIVERY OF OBJECTS FOR EXHIBITION.

Exhibitors are earnestly requested to notify in writing, previously to the day of meeting, what plants they intend to supply, in order that due provision may be made for the proper distribution of the specimens on the exhibition tables. The best places will be secured for those who comply with this request.

As it is necessary that the Judges should proceed to consider the respective merits of the exhibitions by 10 A.M., and as it is absolutely indispensable that the tables should be arranged by that time, it has been determined that *no subject for exhibition shall be admitted into the garden after half-past eight o'clock in the morning*; and if the owners of any locked-up boxes, or other cases, should not be in the exhibition-tent at the said hour, such cases or boxes must be excluded from competition for medals.

All specimens whether of fruit or flowers, will remain untouched until after six o'clock, when they will be delivered into the hands of the exhibitors, who are most particularly requested not to give away their cut flowers in the tents, as much confusion has been found to arise from that practice.

ADMISSION OF EXHIBITORS.

Exhibitors or other persons required to assist in bringing in the objects for exhibition, will be admitted before half-past eight in the morning at the Carter's Yard Entrance Gate.

Every principal exhibitor of subjects for which medals are *specifically* offered may be furnished with one pass-ticket, which is not transferable, for which he is requested to apply before ten o'clock, AT WHICH HOUR THE GARDEN WILL BE CLEARED OF ALL PERSONS not officially detained there.

Exhibitors may re-enter the Garden after one o'clock, when they will be required to give up their pass-tickets at the Carter's Yard Gate.

FLOWER-STANDS.

Exhibitors of cut flowers must SUPPLY THEIR OWN BOXES OR STANDS. No box or stand shall exceed eight inches in height at the back, or eighteen inches in depth from front to back. The lids of all boxes must be either loose or made to unhinge.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; namely,

			£	*s.*	*d.*
C.	The Certificate	value	0	10	0
SB.	Silver Banksian Medal		1	0	0
SK.	Silver Knightian ditto		1	5	0
LS.	Large Silver ditto		1	15	0
SG.	Large Silver Gilt ditto		4	0	0
GB.	Gold Banksian ditto		7	0	0
GK.	Gold Knightian ditto		10	0	0
LG.	Large Gold ditto		20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. *If within one month after the third Exhibition of the year* no intimation shall have been received from an Exhibitor of the manner in which he desires his Medals to be disposed of, all the Medals due to him will be prepared and *transmitted to him through the usual public conveyances, without further notice.* In case an Exhibitor shall receive a First Prize in any one Letter, he shall not be entitled to receive any other Medal in the same Letter; except in Z, AA, and BB.

SUBJECTS OF EXHIBITION.

These will be divided into Classes, as explained further on.

No articles not of horticultural produce will be allowed to be placed upon the tables.

Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will IN ALL CASES BE REQUIRED TO SIGN A PRINTED FORM OF DECLARATION TO BE FURNISHED TO THEM IN THE GARDEN stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the Judges should occur, in consequence of mistakes on the part of Exhibitors in filling up such declarations, the Society cannot undertake to rectify the errors afterwards.

Names fairly written are to be attached by Exhibitors to all Florists' flowers; and the Judges are restrained from awarding any Medal to such Exhibitors, whatever their merit may be, if this regulation is not complied with. By Florists' flowers are meant not only flowers usually so named, but also Fuchsias, Pelargoniums, Roses, and Calceolarias.

Class I.—FLOWERS for which nurserymen and private growers exhibit independently of each other.—

A. Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast, GB, SG, LS, SK.

B. Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast, SG, LS, SK.
N.B. Persons exhibiting in B cannot also exhibit in C.

C. Pelargoniums, in collections of six varieties, in pots of 8 to a cast, LS, SB.

D. Rhododendrons, in pots; not fewer than 12 plants in 12 varieties. LS, SK, SB.

E. Roses, in pots, in collections of 25 distinct varieties, GB, SG, LS.
N.B. It is the wish of the Society, in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.

F. Moss Roses in loose bunches, as gathered, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties, SK, SB, C.

G. Other Roses, exhibited as in the last letter, and in 50 varieties, LS, SK, SB, C.
N.B. No one who exhibits in this letter, can also compete in the following.

H. Other Roses, exhibited as in the letter F, and in 25 varieties. SK, SB, C.
N.B. Higher Medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.

I. Cape Heaths, in collections of 20 distinct varieties. GB, SG, LS.
N.B. It is expected that the same plant is not exhibited on more than one occasion.

K. Cape Heaths, in collections of 6 distinct varieties. SG, LS, SK.
N.B. No person who shows in I will be allowed to exhibit also in K.

L. Herbaceous Calceolarias, in sixes; in pots of 12 to the cast. LS, SK, SB.

M. Shrubby Calceolarias, in sixes; in pots of 12 to the cast. LS, SK, SB.

N. Carnations, in pans of 24 blooms. LS. SK, SB.

O. Picotees, in pans of 24 blooms. LS, SK, SB.

P. Pinks, in pans of 24 blooms. SK, SB.

Class II.—FLOWERS; for which all persons are admitted to equal competition:—

Q. Stove or greenhouse plants, in collections of 40 plants. GK, GB, SG, LS.
N.B. Heaths, Calceolarias, Fuchsias, to be excluded from Q. R. and S.

R. Stove or Greenhouse plants, in collections of 20 plants. GB, SG, LS.
N.B. Persons exhibiting in Q not to compete in R also.

S. Stove or Greenhouse plants, in collections of six distinct species. SG, LS, SK.
N.B. Persons exhibiting in Q or R will not be allowed to compete in S also.

T. Greenhouse Azaleas; to be shown in 12 distinct varieties. GB, SG, LS.

U. Collections of Stove or Greenhouse climbers. GB, SG, SK.
N.B. The Gold Banksian Medal is not to be awarded for fewer than 12 distinct kinds.

V. Exotic Orchidaceæ, in collections of not fewer than six species. GK, GB, SG, LS.

W. Exotic Orchidaceæ, in single specimens, SG, LS, SK.

X. Tall Cacti in flower, LS, SK.

Y. Fuchsias in collections of 12 distinct varieties, LS, SK.

Z. Single specimens of new or rare ornamental plants, SG, LS, SK, SB, C.
N.B. These medals will be awarded by the Society's officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter.

AA. Miscellaneous subjects, SK, SB, C.
N.B. Cockscombs, Hydrangeas, and cut flowers are altogether excluded from exhibition.

BB. Seedling Florist's flowers, SK, SB, C.
N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than five seedlings at each meeting.

Class III.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.

N.B. All fruit must be *fully* ripe and *well coloured*; if the contrary, it will be disqualified.

1. Miscellaneous collections of fruit, consisting of at least three different kinds. Peaches and Nectarines being considered as only one kind, GK, GB, LS.
   N.B.—Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.
2. Grapes. SG, LS, SK, SB.
3. Pine Apples. SG, LS, SK, SB.
4. Peaches or Nectarines, in dishes of six specimens. SK, SB.
5. Miscellaneous fruit. SK, SB. C

JUDGES.

The Judges have the power of increasing or diminishing the *number* and *value* of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered, less for new and curious objects than for fine specimens of Horticultural Skill, the design of the Council in instituting these meetings, being not so much to encourage the collector, as to reward the skilful Gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

FUCHSIA ST. CLARE.

YOUELL & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Advertisement of the above magnificent Fuchsia, inserted in this paper of the 3d inst., together with their two new Verbenas.

Great Yarmouth Nursery, Dec. 8, 1842.

TO PEAR-GROWERS.

T. RIVERS, JUN., begs to recommend to notice his Catalogue of PEARS, in which those varieties most worthy of notice are pointed out. This will be sent post free on a paid application. Plants of the following sorts, raised by the late Mr. Knight, may now be had:—

Althorpe
Althorpe Crassane
Brougham
Boughton Bergamot
Broom Park
Belmont
Downton
Eyewood
Garnons'
March Bergamot
Monarch (true)
Rouse Lench
Shobden Court
Wormsley Grange
Winter Crassane
Seedling (not named)
Ditto ditto

SHIRLEY VINEYARD, NEAR SOUTHAMPTON,—NURSERY DEPARTMENT.

CLEMENT HOARE respectfully announces that he has now on sale an extensive collection of Grape Vine Plants of superior growth, and of the most approved sorts in general cultivation, varying in price from 2*s.* 6*d.* to 7*s.* 6*d.* each.

Lately Published,

A PRACTICAL TREATISE on the CULTIVATION of the GRAPE VINE on OPEN WALLS. By Clement Hoare. 3d edition. 8vo, 7*s.* 6*d.* boards. Longman & Co., London. Sold by all Booksellers, and at the Vineyard at Shirley.

DAHLIAS.

WM. DODDS, in reply to numerous applications for his two SEEDLINGS, begs to say that there being only four Roots of "Favourite," and seven of "Colonel Baker," he is unable to send them out to the trade in dry roots, and has disposed of the Stock of both Varieties to Mr. Keynes, Florist, Salisbury.—Salisbury, Dec. 6th, 1842.

T. RIVERS, JUN., begs to offer the following choice varieties of HARDY RHODODENDRONS and BELGIC AZALEAS. Healthy plants from 1 foot to 18 inches high, mostly from pots.

Rhododendrons.

1.	Arboreum album	10*s.* 6	9.	Hybridum, very strong plants	3*s.* 6
2.	Arboreum ponticum album	7 6	10.	Macranthum roseum	7 6
3.	Altaclerense	3 6	11.	Mundula, dwarf	10 6
4.	„ coccineum	7 6	12.	Nobleanum, dwarf and early	5 0
5.	„ splendens	7 6	13.	Nobilis, dwarf	10 6
6.	Angustum, robust and fine habit	21 0	14.	Princeps	7 6
7.	Eximium	5 0	15.	Russellianum	5 0
8.	Formosum	7 6	16.	Speciosum	10 6
			17.	Strictum	10 6

With exception of numbers 1 and 17, which are species, the above are hybrids of R. arboreum; numbers 1 and 2 have flowers of pure white without spot; numbers 3 to 15 have crimson and scarlet flowers of different shades, with black spots.

1.	Ponticum album	1*s.* 6	13.	Lowii	5 0
2.	Atro-rubens	1 6	14.	Magnoliæfolium	1 6
3.	Album multi-maculatum	7 6	15.	Nivaticum	5 0
4.	Contortum, very dwarf	1 6	16.	Pumilum	1 6
5.	Caucasicum album, or new white	3 6	17.	Roseum	1 6
6.	Coccineum	3 6	18.	Roseum flore-pleno	10 6
7.	Carneum maculatum	2 6	19.	Smithii album	5 0
8.	Flos pictum	5 0	20.	Spirale	3 6
9.	Fulgidum, crimson	10 6	21.	Splendidum	5 0
10.	Grandiflorum	3 6	22.	Spectabile	5 0
11.	Guttatum	5 0	23.	Tigrinum, blush-spotd	10 6
12.	Hyacinthiflorum, dbl. purple	5 0	24.	Wilsonii	5 0
			25.	Vittatum	10 6
			26.	Atro-purpureum, very dark purple	5 0

The above are varieties of R. ponticum. Numbers 3, 8, 11, 13, 15, and 19, have cream-coloured and white flowers, beautifully and curiously spotted with brown, red, and greenish spots; No. 5 is a very early and dwarf variety, with flowers of the palest blush, changing to pure white; 10 and 15 have double flowers; 19 has curious small flowers nearly blue; No. 6 has not scarlet flowers, as its name implies—they are of a light carmine.

1.	Adansonii	10*s.* 6	4.	Fragrans	2*s.* 6
2.	Azaleoides	1 6	5.	Gowerianum	3 6
3.	Azaleoides album	7 6			

The above are hybrids of Azaleas, with Rhododendron; No. 4 is dwarf and very fragrant.

1.	Cinnamomum	15*s.* 0	6.	Catawbiense hybridum	1*s.* 6
2.	Caucasicum	5 0	7.	Catawbiense flore-pleno	5 0
3.	Campanulatum	7 6	8.	Dauricum atrovirens	1 6
4.	Camp. hybridum	10 6	9.	Luteum	42 0
5.	Catawbiense	1 6			

With exception of No. 1, the above are quite hardy; No. 4 is a robust-growing and very interesting hybrid; No. 9 is said to be a hybrid of Azalea pontica, with R. caucasicum.

Azaleas, fine Belgic varieties.

1.	Pontica alba	1*s.* 6	17.	Double White	1 6
2.	„ alba flore-pleno	3 6	18.	Decus hortorum	3 6
3.	„ alba globosa	2 6	19.	Early Pink	1 6
4.	„ eximia	3 6	20.	Electa	2 6
5.	„ lutea rubicunda	3 6	21.	Insignis	2 6
6.	„ mirabilis	3 6	22.	Large Orange	2 6
7.	„ magnifica	3 6	23.	Morterii genio	2 6
8.	„ rosea	2 6	24.	Maritima	2 6
9.	„ spectabilis	3 6	25.	Nobilissima	2 6
10.	„ tricolor (Wulf)	2 6	26.	Pulchella	2 6
11.	„ tricolor albicans	2 6	27.	Præstantissima	2 6
12.	Cuprea splendens	2 6	28.	Princess Augusta	2 6
13.	Coccinea speciosa	3 6	29.	Splendens	2 6
14.	Calendulacea	2 6	30.	Speciosa	2 6
15.	„ crocea	2 6	31.	Venustissima	2 6
16.	„ grandiflora	2 6	32.	Violæ odora	2 6
			33.	Vittata	1 6

Of the above Numbers, 1 to 11 are the earliest of Azaleas; Numbers 19, 25, 29, 30, and 31 follow in succession; Numbers 18, 23, 27, 28, 32, and 33 are late flowering varieties, with beautiful striped flowers.—All packages sent carriage free to London.

Sawbridgeworth, Herts., Nov. 30, 1842.

FORRES NURSERIES.—The Subscribers beg to intimate that their Stock of TRUE NATIVE HIGHLAND FIRS, LARCHES, and all other kinds of FOREST PLANTS, Ornamental PINES, &c., is this season unusually large, consequently prices are low. Lists will be furnished free on application, and the Trade supplied at the wholesale rate.

Nov. 1842. John Grigor & Co., Forres, N.B.

BRAGG'S ANTAGONIST, the successful WHITE DAHLIA.—W. Bragg begs to inform Dahlia-growers in general, that he intends sending out (through the Trade, who will receive the usual allowance) his SEEDLING DAHLIA ANTAGONIST, in May next; Plants, 10*s.* 6*d.* each. The quality of this flower is too well known to need description, as, in addition to its having produced the best White, by being awarded Mr. Wildman's prize of 5*l.* 5*s.*, it was placed first at the Salthill Grand Seedling Show, September 16, where 25 varieties of 1841 were placed for competition; 6 blooms were also shown at the Floricultural Society of London, September 27, making the third time of its being shown, where 6 blooms were required for each exhibition; likewise exhibited at the Isle of Thanet and Teddington Shows, which will attest its constancy, it being well known that only four of the six plants bloomed, which comprised the whole stock. As only a limited number of plants can be made, W. B. pledges himself to execute the orders in strict priority, and will publish a list early in January of the Trade who will be able to supply plants in spring.

A few Ground Roots of Bragg's Great Western Dahlia, at 3*l.* 3*s.*, to be disposed of.—North Star Tavern, Slough, Nov. 16, 1842.

THE TRUE TOBOLSK RHUBARB.

YOUELL & Co. beg to announce they are now housing the above for Forcing. Roots planted now will be ready for cutting at Christmas.

This Rhubarb, being the earliest in the open border by three weeks of any yet introduced, renders it highly valuable for Forcing; its colour is of a beautiful transparent coral; and for delicacy of flavour it is unequalled. It can be forwarded with safety to any part of the United Kingdom, on the receipt of a Post-office order, at the rate of 12*s.* per dozen roots.

Great Yarmouth Nursery, Dec. 1, 1842.

JAMES PAMPLIN, Nurseryman, Florist, &c. Walthamstow, Essex, begs to return thanks to his friends for their liberal orders for his Seedling Pelargoniums sent out last season, and which he flatters himself have given general satisfaction. He is now sending out the undermentioned new Seedlings, raised by Mr. J Wilson. As regards their qualities nothing need now be said, as they have taken so many prizes, and have been so universally admired at the exhibitions of the London Horticultural Society at Chiswick, and at most other Societies round the Metropolis, that they must still be fresh in the memories of all lovers of that splendid flower.

J. P. begs to refer them to the report of the exhibition at Chiswick, in the *Gardeners' Chronicle* of July 16th.

Achilles	£3	3	Duke of Wellington	£2	2
Acis	3	3	Fair Maid of Leyton	3	3
Ada	3	3	Galatea	2	2
Adelaide Kemble	2	2	Hesperus	2	2
Aurora	3	3	Laura	1	10
Beauty of Essex	3	3	Prince Albert	2	2
British Queen	2	2	Princess Royal	2	2
Count D'Orsay	3	3	Queen of the East	3	3
Countess of Wilton	3	3	Sir Robert Peel	1	1
Creole	3	3	Sir Walter Scott	3	3
Duke of Devonshire	2	2	Venus	2	2

J. P. regrets that owing to the very limited stock of his Seedling Beauty of Walthamstow, he must defer sending it out at present.

J. P. has also a fine stock of those Pelargoniums he sent out last season, which have so enriched the collections of the principal cultivators of that flower at very low prices, Catalogues of which may be had on application.

J.P. begs further to state that he is now sending out his splendid new Seedling CEREUS, which he has named Cereus speciosus elegans, at 21*s.* each, which was exhibited at the Horticultural Gardens at Chiswick in July last; for description of which, see *Gardeners' Chronicle*, July 16th.

OAKLEY'S "SURPRISE" AND OTHER DAHLIAS.

SAMUEL GIRLING begs to refer the Trade and his *friends* generally to his advertisement in the *Gardeners' Chronicle* of the 12th Nov., 1842.

Danecroft Nursery, Stowmarket, Suffolk.

WOODLANDS NURSERY, MARESFIELD.

WILLIAM WOOD & SON beg leave to inform their Friends, Amateurs, and the Trade in general, that in consequence of the unprecedented demand already on hand for the splendid new dark China Rose,

"MIELLEZ'S PRINCE OF WALES,"

they are unavoidably compelled to desist taking any further orders for it at present.

The remaining stock of plants, which will be ready for delivery in May, are already bespoken.—Woodlands Nursery, Maresfield, Dec. 6, 1842.

NEWTON AND UPTON NURSERY GROUNDS, CHESTER.

THE PLANTING SEASON having now arrived, we beg leave to invite the attention of Planters to our very extensive and well-grown Stock of FOREST-TREES, of all ages and sizes most suitable for forming Plantations; strong Quicks for Fences; Fruit-trees, Evergreens, Shrubs, and every other article connected with the General Nursery Trade—and all at the lowest scale of charges. Please apply to FRANCIS & JAMES DICKSON, who have much pleasure in being able to inform their Agricultural customers and Farmers generally, that they have, this season, succeeded in saving a remarkably large Stock of their best selected and most approved Purple-topped Swedish TURNIP, which has given so great satisfaction throughout the kingdom.

December, 1842.

CHARLES FARNES, No. 128, ST. JOHN-STREET LONDON, respectfully informs the Public that his Collection of New KITCHEN-GARDEN SEEDS are now ready to send out. Owing to the fine harvest, the quality is excellent, and will be found to give general satisfaction. C. F. being connected with the principal Market-Gardeners round London and in the Provinces, is enabled to select the best and most choice varieties from their original sources.

Farnes' Superior First Early Peas—this has been the first Pea brought into Covent Garden Market for some years past—height, 1½ to 2 ft.

True Drumhead Savoy
Imported Early Dutch Turnip
Early Round Nonsuch do.
True Dark Blood-Red Beet
Large Silver-stemmed do.
Imported French Sugar do.
,, ,, Summer Endive
,, ,, Yellow-leaved do.
Dwarf London Green Curled do.
Morgan's Early Nonsuch Potatoes
True Early Ash-leaved Potatoes.

With every variety of Vegetable and Flower Seeds in cultivation; a general Catalogue of which, with prices, will be forwarded on application.

MESSRS. DICKSON, NURSERYMEN AND FLORISTS, Acre Lane, Brixton, beg to inform Amateurs and Florists, that their Catalogue of Carnations, Picotees, Auriculas, &c., is now ready, and may be had on application to them, or Messrs. WARNER and WARNER, Seedsmen, &c., Cornhill, London.

ADAMSON'S FINAL SALE.

Five useful Cart Horses, Waggon, Carts, Capital Chaise, a newly-erected Seedshop covered with lead, excellent Nests of Seed Drawers, Bins, Counter, a few lots of useful Timber, &c.

MESSRS. PROTHEROE and MORRIS are instructed to submit the above to public competition, by Auction, on the premises, Stoke Newington Common (by order of the Trustees), on MONDAY, Dec. 19th, 1842, at 11 o'clock. Also the remaining Nursery Stock, consisting of Fruit and Forest Trees, Deciduous Shrubs, &c; about 2000 of Myatt's "British Queen" Strawberry. May be viewed prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

HOGG'S CARNATIONS, PICOTEES, PINKS, & AURICULAS.

MESSRS. PROTHEROE & MORRIS will submit to public competition by Auction, on the premises, Paddington-green, on Monday, December 12th, 1842, and following day, at 11 o'clock, by order of the Proprietors, in consequence of the lease having expired, the whole of this celebrated Collection; also Pits and Frames, Hand-lights, capital Carnation Stage, Show Boxes, Pots and Pans, Carnation Mould, Rotten Dung, Utensils in Trade, &c. May be viewed prior to the Sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l.* 5*s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WAYTE's New Patent Land-presses and Drills.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

PENN'S SYSTEM OF OBTAINING A FREE CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL AND OTHER BUILDINGS.

W. HILL having had considerable experience in the Erection of Horticultural Buildings, after the most approved designs, and having received from the inventor of the above system a complete induction into its practical application, begs to announce to the Nobility, Gentry, and Others, that he is prepared to furnish Designs and Estimates for every description of Horticultural Erection, upon application personally, or by letter addressed to W. HILL, Builder and Surveyor, Lewisham.

This system, which is allowed by men of science and all the most eminent practical Horticulturists in the Kingdom to be the most perfect mode of Heating, combined with economy, has undergone the most *complete test in every variety of application*, by the inventor and others, with a success which can only be sufficiently appreciated upon an inspection of its effects on a Collection of rare Plants and Fruits at any season of the year.

W. HILL will (through the kind permission of Mr. Penn, Lewisham—Mr. John Willmott, Isleworth, and others) be happy to afford the most satisfactory demonstration of the superiority of this to all other modes of Heating, and every other information required may be obtained upon application personally, or by letter addressed as above.

Now published, price 10*s.*,

A SECOND Edition of MILL'S TREATISE ON THE CULTURE OF CUCUMBERS, MELONS, SEA-KALE, and ASPARAGUS, with a descriptive Plate of his Pit, and also daily Notes of Practice from December to February inclusive.

Published by WM. SMITH, 113, Fleet-street, and sold by all Booksellers.

THE QUARTERLY REVIEW, No. CXLI., is published this day.

CONTENTS:—I. The Honey-bee and Bee Books—II. Books for Children—III. Brandy and Salt; Homœopathy; Cold-Water Cure—IV. Lord Mahon's Life of the Great Condé—V. Borrow's Bible in Spain—VI. Todd on Antichrist—VII. The Anti-Corn-Law League. JOHN MURRAY, Albemarle-street.

WANTS a SITUATION as GARDENER, a Married Man, without children, where the forcing of Grapes, Melons, &c. is required; if there are Pines, Hot and Greenhouse Plants to superintend, so much the better. Can have an excellent character from the gentleman he is about leaving. Address W. F., Mr. CARTER's, Seedsman, &c., 238, High Holborn, London.

WANTS a SITUATION as GARDENER, a Married Man, without incumbrance, who well understands his business; his Wife is a good Cook. Can have most respectable reference as to character from their last places, where they lived upwards of three years. Address to L.M., at Mr. CHARLWOOD's, Seedsman, 14, Tavistock Row, Covent Garden, London.

WANTS a SITUATION as GARDENER, a Married Man, aged 38, no family. He is intelligent and good-tempered, perfectly sober and steady; understands forcing of Grapes, Peaches, Melons, &c.; propagation and growth of Stove and Greenhouse Plants; the Kitchen and Flower Garden: no objection to look after Meadow Land; a member of the Established Church; character moral and professional unexceptionable, from a highly respectable family he will shortly leave. A moderate salary required. Direct, A. B., Mr. PHILIP CONWAY's, Nurseryman and Florist, Earl's Court, Brompton, Middlesex.

TO NOBLEMEN AND GENTLEMEN.—WANTS a SITUATION as GARDENER, or as GARDENER and FORESTER, a Married Man, about 30 years of age; the most satisfactory references can be given as to ability, integrity, industry, &c. Address, W. H., at Messrs. VEITCH and SON's, Nurserymen, Exeter.

N.B.—Salary about 70*l.* per annum, with cottage, &c.

WANTED, in the COUNTRY, a Steady, Active, and Intelligent Young Man, as an Assistant in a Nursery and Seed business; he must be of an unexceptionable character, and have a good knowledge of his trade, and will be required to live entirely in the house and conform to the rules of a dissenting family.—Apply to Mr. BRISTOW, Knightsbridge, London.

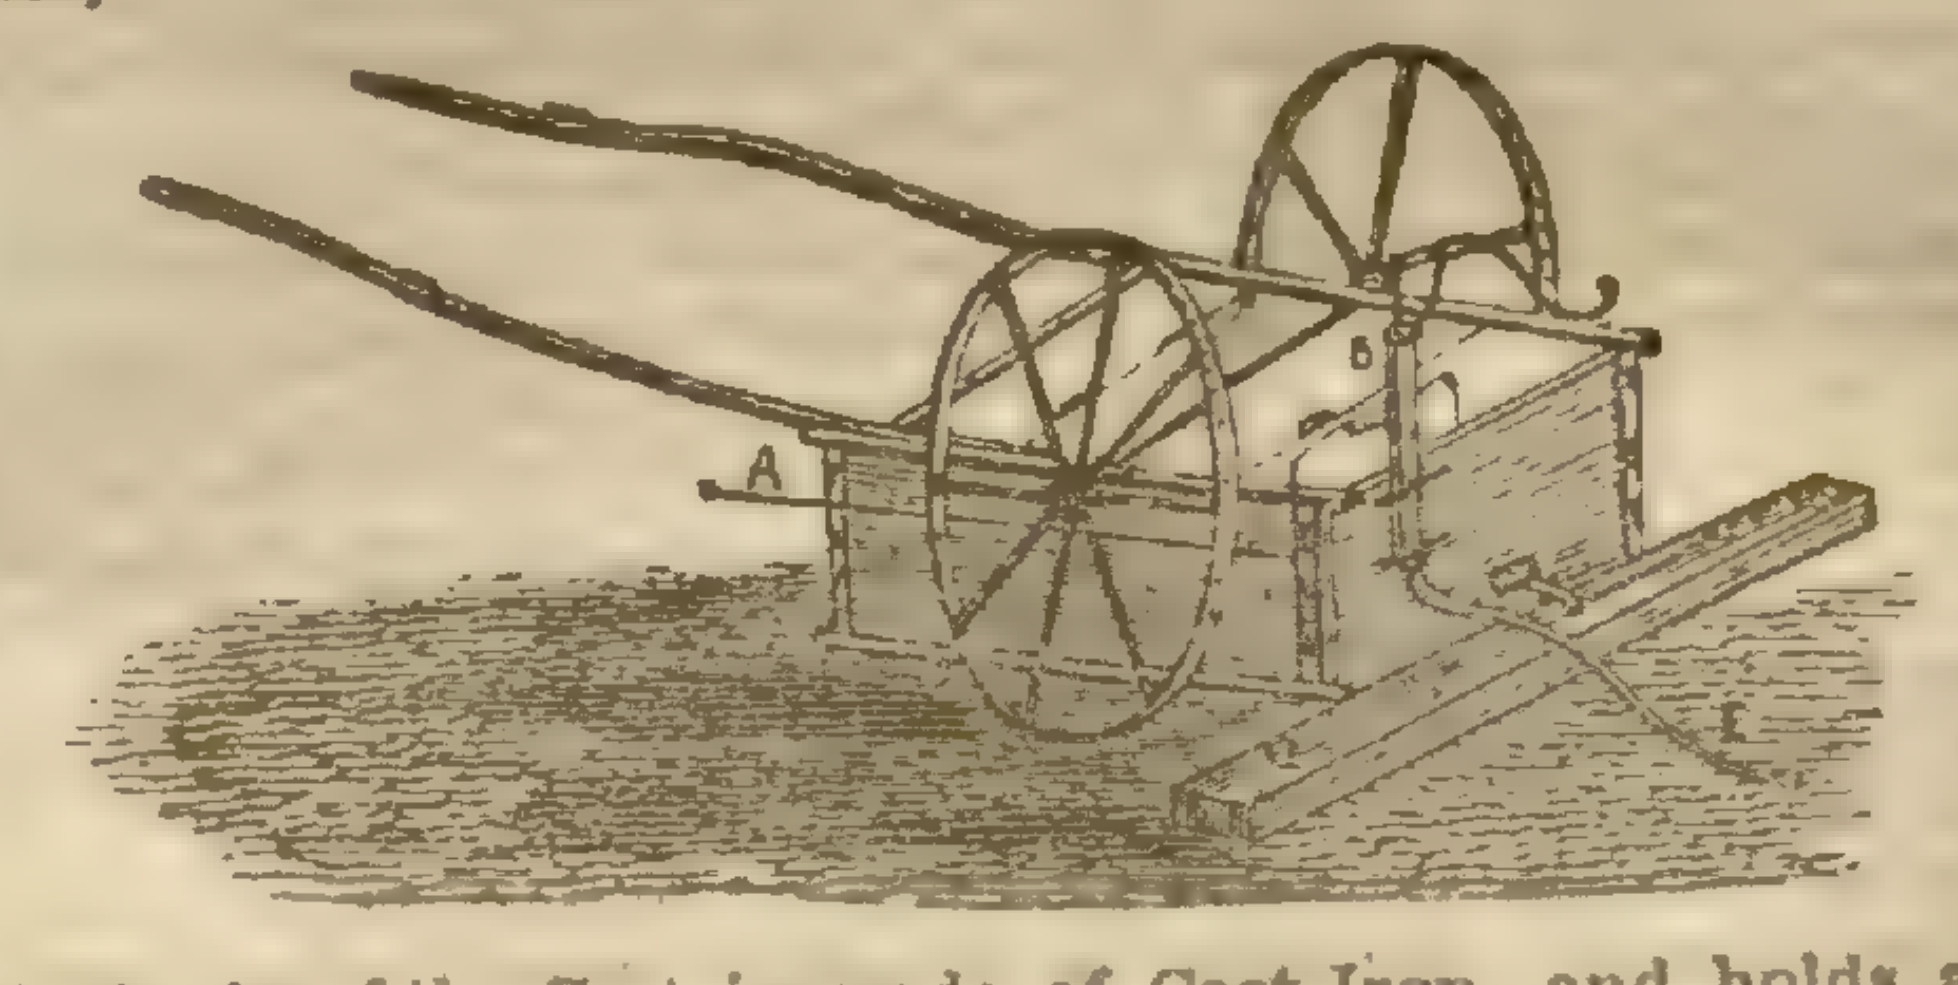
TO APPLE AND GOOSEBERRY CULTIVATORS.

WANTED, a few Three or Four-Year-Old Plants of the following sorts of APPLES, about 4 feet in height, and trained in bell-glass fashion, viz.: Court-pendu Plat, Sturmer Pippin, Herefordshire Pearmain, Pearson's Plate, Hughes' Golden Pippin, Ribston Pippin, Kerry Pippin. Also a few Three or Four-Year-Old Plants of the following sorts of GOOSEBERRIES, viz.: Red, Green, and Yellow Champagne; Ironmonger, Red Turkey, Rob Roy, Early White, White Crystal, White Honey, Pitmaston Greengage, Green Walnut, Rumbullion. Send name, address, and particulars immediately to F. D. R., at HART's Newspaper Office, Robert-street, Grosvenor-square.

WANTED, a correct copy of the GARDENERS' CHRONICLE for last year, 1841. Any person having one to dispose of may meet with a purchaser by applying to Mr. CHADWELL, Bookseller, Peterborough.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS.

CROSSKILL'S LIQUID MANURE CART, which received the Honorary Reward of the Royal Agricultural Society.



The Body of the Cart is made of Cast-Iron, and holds about 200 gallons. A, The Brass Valve Lever. Without stopping the horse, the man pulls the Iron Lever, A, to let out the liquid upon the Spread-Board, C. B, Patent Iron Pump, which cannot possibly choke or get out of order. E, The Flexible Leather Pipe, 7 ft. long, with 3 ft. copper pipe at the end.—Price delivered in Hull, 25*l.*

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12*l.* 12*s.*

BY HER MAJESTY'S ROYAL LETTERS [illegible]T.

BROWN'S IMPROVED GARDEN POT.

ROBERT BROWN having made an important and successful improvement in the construction of Garden Pots, submits them to the Floricultural Profession, and to all who are interested in the propagation and cultivation of Plants. It is well known that many valuable plants are annually lost, or much injured, by having the delicate fibres of their roots dried up, from the pots in common use becoming heated by the sun's rays, or from exposure to drying currents of air, &c., for which evils a remedy has long been sought. The Improved Garden Pot now offered to the Public is intended to counteract this irregularity of temperature, by being made hollow-sided, with an aperture on the rim, that the space between the outer and inner surface may be filled with water when required, and the aperture being made air-tight by means of a peg, a uniform degree of coolness or humidity may be preserved, and the plants, although exposed to the mid-day sun, will have their roots secured from injury. The Improved Garden Pot does not differ in appearance from those in common use, but the advantages of its construction, for the growth of plants, or for the propagation of cuttings, are too obvious to need further comment.—R. B. has submitted his invention to several eminent cultivators, from whom he has received the greatest encouragement.

Specimens may be seen at the Horticultural Society's Rooms, 21, Regent-street, or at Mr. BROWN's Pottery, Surbiton-hill, near Kingston, Surrey, and at his private residence, Ewell.

GUANO ON SALE BY THE IMPORTERS, ANTHONY GIBBS AND SONS, LONDON; GIBBS, BRIGHT, AND Co., LIVERPOOL AND BRISTOL.

AGRICULTURE AND THE CORN LAW.

Just Published, 54 pp. 8vo., Price 4d., Post free 10d.,

THE THREE PRIZE ESSAYS written for the Council of the National Anti-Corn-Law League, demonstrating the Injurious Effects of the Corn Law on Tenant Farmers and Farm Labourers, and the Advantages which those classes would derive from its Total and Immediate Repeal.

The Trade supplied at HALF-PRICE for *bonâ fide* orders (not Sale or Return).

Country Booksellers may have their parcels forwarded free to their Agents in London, on sending their orders (with remittance) to J. GADSBY, Manchester.

Published by J. GADSBY, Manchester. Agents for London: R. Groombridge, 5, Paternoster Row; Ridgway, 169, Piccadilly; and Hooper, Pall Mall East. Edinburgh: W. Tait. Glasgow: W. R. M'Phun, Trongate.

TO BOOKSELLERS.—WANTED, a COPY of the FIRST VOLUME of the JOURNAL of the ROYAL AGRICULTURAL SOCIETY.—Address by letter, to Mr. A., No. 5, Maiden-lane, Covent-garden.

SATURDAY, DECEMBER 10, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Dec. 13	Zoological	8½ P.M.
Wednesday, Dec. 14	Geological	8½ P.M.
	Medico-Botanical	8 P.M.
Friday, Dec. 16	Botanical	8 P.M.
Tuesday, Dec. 20	Linnean.	8 P.M.
Wednesday, Dec. 21	Microscopical.	8 P.M.

Our readers are doubtless aware that the views of the Chemistry of the animal kingdom which Professor Liebig has published are not less striking than those for which he has acquired so much celebrity with reference to Vegetation. Dr. Lyon Playfair having made them the subject of two very admirable lectures, delivered this week before the Royal Agricultural Society, they will be found in another column authentically reported; and we may congratulate both the public and Dr. Liebig upon these curious and important views having found so able an expositor. Dr. Playfair's first lecture is given this week; his second will appear in our next Number.

Modern charity is a curious sentiment. Our forefathers said, Let charity begin at home; but we in our wisdom say, Let charity begin at a distance. In former days, we spent our spare means upon our own poor immediate dependents, and we spared that we might spend. In latter times we economise at home that we may be lavish abroad. We starve the poor man that is white, in order to feed the savage that is black or brown. We neglect the morals of Warwickshire or Kent, in order that we may care for the souls of the Feejees and Ashantees. Misery in the Sandwich Islands meets with all imaginable sympathy—a fire at Hamburgh conjures thousands out of our pockets—and we pour forth our wealth to repair the havoc of a hurricane in Madeira. But half-starved peasants and famishing artisans close by, honest English faces pinched with hunger, and tortured by the greediness of hard-hearted taskmasters in Whitechapel, are objects close upon us, and we cannot see them. Millions are paid to distant missions for the improvement of the population, and eloquence is exhausted in appeals to the compassionate for aid in these well-intentioned undertakings. Far be it from us to undervalue such good works; nothing can be more praiseworthy—only, we should do something at home upon as large a scale. But, alas! we of the present generation are afflicted with false vision: our eyes are fitted with moral telescopes, which hide the near and magnify the distant.

Who would suppose that a powerful, a generous, a noble nation like the English, blessed beyond all others with the means of conferring happiness, should vie with the lowest of its Continental neighbours in scenes of moral degradation, misery—nay, famine, among its poor? We blame no one for this; for the truth is, either the higher and richer classes do not know of it, or they believe it to be a calamity beyond their control—hopeless and irremediable. Not that this is always the case: there are many great examples of the contrary; but, unfortunately, there is not enough of them. In a densely-peopled country like England, a few examples, however admirable, can do little good, unless they are generally followed by the great mass of the wealthy classes. We affirm, and we hope we can prove, that the remedy for the great mass of the distress is at every one's door; and that the application of the remedy, so far from impoverishing the hand that gives, will repay the cost, not merely with the gratitude of the poor, and the still better reward of a conscience happy in its own benevolence, but substantially, and with more augmented wealth.

Let it not be supposed that we recommend indiscriminate charity; it is, unfortunately, impossible to refuse it under existing circumstances, unless a man's heart is made of stone; but these circumstances should be removed, for it is they which are undermining, and not slowly, the whole fabric of our society; and it is to their removal that we wish to address ourselves.

What is wanted by the poor of this country is labour—*constant* employment—something *always* to do—not charity. The asking for pecuniary assistance reduces a poor man to a beggar; it degrades him in his own eyes, and destroys that feeling of independence which we should all of us cherish and encourage. But when he says to his richer neighbour, "I have strength of body—you have money; I have the power of enduring toil—you have the means of rendering my labour useful; let us exchange the one for the other"—he is in the position of a merchant trafficking with his wares, and obtaining what he wants by barter. In this there is no degradation: on the contrary, there is a feeling of importance—the consciousness that he too is something, which reconciles the poor man to his lot. But when he is told that he is not wanted—that the only thing he possesses, his bodily strength, is useless—that all that God has given him is in vain, what *can* he do but sink in misery, abandon himself to despair, and fall back to drown amidst the waters of bitterness? How can we wonder, then, at his lending a ready ear to what designing demagogues may say—to his becoming their tool, and joining in their wildest schemes? for what is the fabric of society to him? what terrors can the law have to one deserted by all hope? what lot can be worse than his already is?

We are drawing no exaggerated picture; we are overstating nothing, when we affirm that there are thousands and tens of thousands of able-bodied willing labourers in this country now, who look forward to the approaching winter without the least prospect of being able to support themselves through it. It is idle to talk of poor-laws and workhouses; however well the poor-law system may be administered, it cannot meet these cases. It is employment that must be found, if we mean to sleep securely in our beds. Employ the poor constantly, and there will be no Chartists; give them something of their own that is worth keeping, and they are not the men to run the risk of losing it, though it be but little, for all the arguments of the cunningest incendiary. Let no one think, that, because we say these things, we are disposed to palliate the wicked instances of agrarian outrage which have become so common. On the contrary, we would punish with the utmost severity all therein concerned. But such practices are neither carried out nor participated in by any considerable portion of the poor; and God forbid that we should punish the misery of one because of the villany of another.

But we are not speaking now to the generosity of the world, nor to their fears, nor to their prejudices; we are speaking directly to their self-interest, or, to use a homely expression, to "their breeches' pockets," when we urge thus earnestly the employment of the poor to a far greater extent than hitherto. Nobody can fail to see the pressing necessity for an immediate improvement of the productive quality of the land. Let political opinions be what they may, nobody in his senses can doubt that it would be a great public blessing, if the 12,000,000 quarters of Wheat now produced in Great Britain could be converted into 24,000,000, without any disproportionate outlay of capital. We, in common with others, believe this to be perfectly practicable, not remotely, but immediately, by the mere employment of more labour.

An explanation of the grounds upon which this opinion is founded, we must reserve till next week, adverting for the present merely to the allotment system. That this, *under good management*, has already shown itself of great importance to the poor, and beneficial to the landlord, can hardly be doubted. We have on former occasions advocated the plan of allowing cottagers to have as much land as they can keep in order, without interfering with their ordinary labour; and we are persuaded that in all cases it has been attended with unmixed good. An instructive instance of the effect of it upon the cottager, and one to which we would most particularly draw the attention of our agricultural friends, was given the other day in the *Leeds Mercury*:—

> "If he is a benefactor to his country who causes two blades of grass to grow where but one grew before, the case of Arthur Broadbent, of Knaresborough, a poor old man who has seen eighty-four winters, ought not to be overlooked, nor suffered to pass away into obscurity. The old man rents a rood of land under Sir Charles Slingsby, for which he pays 9*s*. a year. He has had it in cultivation for the last seven years, and, by the use of his spade only, he has contrived always to have a full crop, by appropriating one half of it to Potatoes and the other half to Wheat, changing the crop every year; so that the part which is planted with Potatoes one year is planted with Wheat the next, and fallow is unknown in his system of husbandry. Except in 1841, he has always reaped six bushels and a half of Wheat from his half-rood of land, which is equal to fifty-two bushels per acre, thus amply rewarding his toil, justifying all that has been written in favour of spade husbandry, and speaking in a language not to be misunderstood the good that might be effected by small allotments for the labouring poor."

Now this, it will be noted, is a result attained without putting the landlord to any expense. And we believe it will be uniformly found that a better rent may be had for land in *small* allotments than in farms. The reason for this has been well explained by Dr. Daubeny in the last number of the Journal of the Royal Agricultural Society, (p. 380,) to which we must refer our readers. We do not dwell upon it at present, because we do not for a moment suppose that the allotment system, with all its advantages, can be anything more than an aid in bettering the condition of the labouring poor.

The great object to be attained in the first instance is the securing them a living. It is idle to talk of increasing the comforts of the poor man, till he has some comforts to increase.

Among the subjects to which the attention of English cultivators requires to be most forcibly directed is that of fertilising land by ploughing-in green crops, a practice little employed here, but much practised on the Continent. In order to put them in possession of what is there known upon the subject, we have caused Professor Charles Sprengel's account of the effect of green manures to be translated; and we most particularly invite the attention of our readers to his statements.

If a planter of great experience were asked which tree he would recommend before all others for profit, he would certainly name the Larch; for, if we consider both its rapidity and its value in the timber-market, it is unrivalled.

> "Of the various uses," says Mr. Selby, "to which the Larch is now applied in agricultural and rural affairs, as well as in civil architecture, it is almost unnecessary to enter into detailed particulars, as it is found more generally applicable and efficient under varied circumstances than any other tree. For the most important wood-work of buildings, such as beams, joists, couples, &c., it is superior to the best foreign Pine timber, possessing all its lightness with the strength and durability of the Oak; these qualities also render it excellent for mill axles, and other works subjected to heavy weights and severe cross strains. It is also, when old and matured,—that is, with a large portion of its substance converted into red or heart wood,—a desirable material for the interior finishing of houses, as we have seen in several instances, as well as for furniture, which takes a beautiful polish, and equals the finest satin-wood in appearance; the only objection to its more general use in the finer departments of the joiner and cabinet-maker being the greater difficulty with which it is brought to a smooth surface under the hands of the workman; but this, by judicious management and proper seasoning, if not overcome, may, at all events, be greatly lessened. Of late years it has also been found to form the best sleepers for railways, and the demand for this purpose annually consumes a large proportion of the thinnings from the extensive plantations in Scotland and the north of England.
>
> "The early period at which the Larch begins to make a profitable return to the planter, and the comparative value of its wood when young, are features which distinguish it from other trees. As a mere stake it has its value, and is far superior in durability to one made of any other tree. At 10 or 12 years old Larch thinnings are large enough for small railing, requiring little or no repair for many years. At 15, and from that to 20 years old, it becomes strong enough for posts, and a superior description of railing; and at this age, and until it becomes of a size to cut up for gates, (which, for durability, we find excel those made of the best Memel timber,) materials for buildings, &c., it may be profitably sawn up, and made into strong 4-railed hurdles for fencing off cattle and sheep, and which, if taken proper care of, will last good, as we have experienced, for upwards of 20 years. In Kent and Sussex, though the soil of these counties is by no means calculated to produce Larch timber, it is grown for hop-poles, which are found to be of first-rate quality, being planted for this purpose in thick masses, the trees not more than 2 feet from each other, in order that the stems may be rapidly drawn up in height, and with the requisite degree of slenderness. In this way, Loudon remarks, and we can corroborate the assertion, 'We have seen the Larch at 3 feet apart drawn up to a height of 40 and 50 feet, with clear straight stems, admirably adapted for hop-poles, and poles for ornamental purposes in gardening.' It has also been occasionally used for the formation of living fences, which are said to bear the shears as well as the Spruce. An instance of such a fence is mentioned by Sir T. D. Lauder, in his edition of 'Gilpin;' and Loudon describes one made by Mr. Gorrie, who, in order to procure an immediate fence, made use of Larch-trees about 10 or 12 feet high; these he planted upon the earth cast out of a 4-feet ditch, laying them at an angle of about 30° with the horizon, and so placed, that their tops inclined over the ditch towards the interior of the field; the plan succeeded to his wish, and he recommends it to those who may have upland fences to form, and Larches of 9 or 10 years old to spare from the thinnings of other plantations."

The Duke of Athol's Larches at Dunkeld are known to every one. In that part of Scotland they are found to grow upwards of 80 feet, on an average, in 70 years; a case is mentioned of 20 of these trees having been felled at the age of 64 years, when they exceeded 100 feet in length each; and in another instance, 11 of the Duke's trees produced above 150*l*. when sold to the shipbuilders. In short, according to the calculation of the Duke's agents, the money which an acre of Larch will eventually produce is considerably beyond 1,000*l*.

There seems no reason why the same result as has been obtained by the Duke of Athol should not be realised everywhere else, where the land suits the Larch. But this is a very material point to consider; for it is well known that in some places the tree grows ill; and in others, although it grows well for a time, it eventually rots. The best Larch soil at Dunkeld is said to be what is called by geologists mica schist; some is clayslate. But, in fact, the Larch will thrive so as to be a profitable tree in almost all elevated rocky places, or where water does not lodge about the roots; but it evidently dislikes permanently wet soil. According to Sir W. Jardine, as quoted by Mr. Selby, the red sandstone is regarded as a soil unfit for Larch, producing heart-rot; while the trees on the grauwacke are sound, and of good quality. As far as our own observation goes, worn-out garden ground, or soil dark-coloured, and therefore rich in humus, is most especially unsuited to it.

Of this we are well assured, that no marshy, or swampy, or springy land, where water lodges either on the surface or below it, will ever bring good Larch. We find, upon turning over the authorities upon the subject, that the mass of evidence which they contain goes entirely to confirm this—and, we also think, to show that the rot of Larch is, in all cases, ascribable to the roots not being drained. We have no room for proof of this, but must content ourselves with referring to the writers on the subject. We think, however, that the situations in which the rot is well known to occur, viz., undrained clays, spongy land, a wet sandy subsoil, moors, and similar places, afford a much more probable explanation of the cause of the evil, than referring it to the action of previous crops, as some have done.

It gives us great pleasure to announce that the very important mission from the Horticultural Society to China has been undertaken by Mr. Fortune, the able Superintendent of the Hothouse Department in the Society's Garden. We congratulate the Fellows of the Society, who, it is hoped, will benefit so largely by this expedition, upon its being confided to such hands.

During Mr. Fortune's absence in China, his place will be filled by Mr. James Donald, from Chatsworth.

WEIGHTS OF FINE HORTICULTURAL PRODUCTIONS.

Pine-apple, *Providence:* weight, 8 lbs.; height, 8 inches; breadth, 7 inches; number of pips in depth, 9; crown, small. A handsome oval fruit, grown by Mr. C. Judd, gr. to Geo. Knott, Esq., Barnet, Hertfordshire.

Grapes, *Black Hamburgh:* bunch weighing 1 lb. 3 oz.; estimated number of berries, 70, giving an average weight of 4 drs. each. Grown by G. Crawshay, Esq., Colney Hatch, near Muswell Hill.

Pear, *Uvedale's St. Germain:* weight, 1 lb. 13 oz.; length, 7 inches; breadth, 5 inches. Grown by Mr. Jas. Robinson, gr. to J. Le Blanc, Esq., Northaw.*

Pears, *Uvedale's St. Germain:* two specimens, each weighing 2 lbs. 8 oz.; length of each, 7½ inches; breadth, 5½. Both handsome fruit, grown by — Hodges, Esq., Hemsted Park.*

Apple, *Gloria mundi:* weight, 1 lb. 7 oz. 7 drs.; height, 4½ inches; breadth, 5 inches. Grown by A. C.*

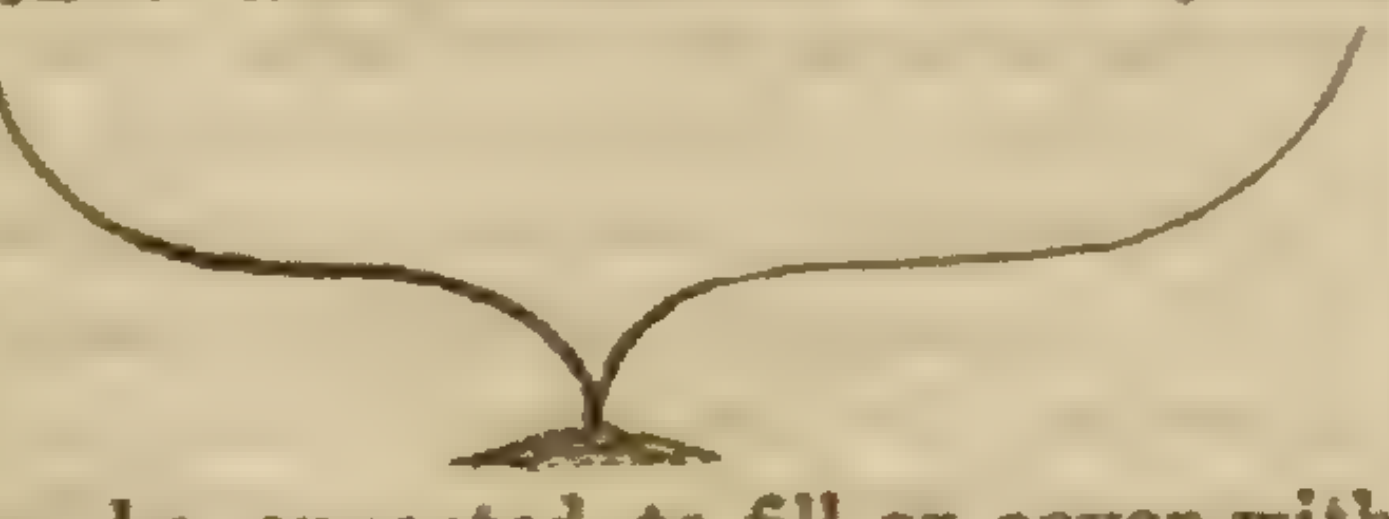
Apple, *name unknown:* weight, 1 lb. 4 oz.; breadth, 4½ inches; height, 4 inches. A handsome fruit, grown by Mr. Spong, gr. to R. Gordon, Esq., Leweston, Sherborne.

The specimens marked thus * may be seen at the *Gardeners' Chronicle* Office.

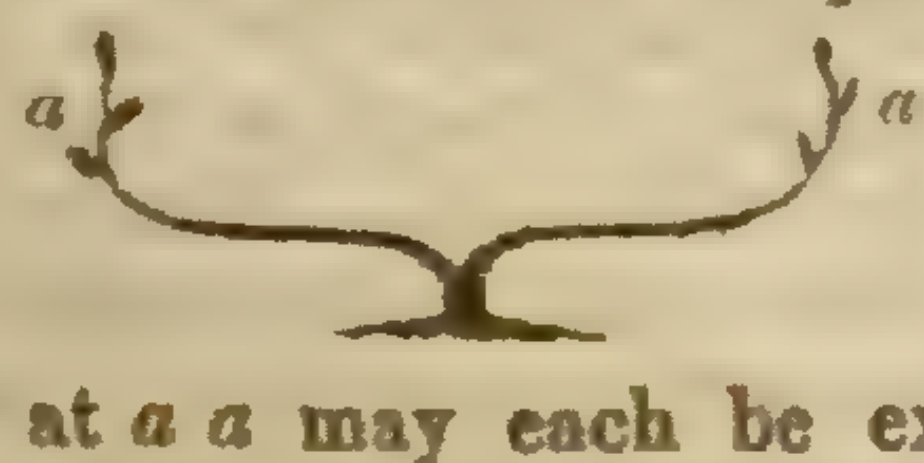
ON TRAINING APPLE AND PEAR TREES.

(*Continued from p. 804.*)

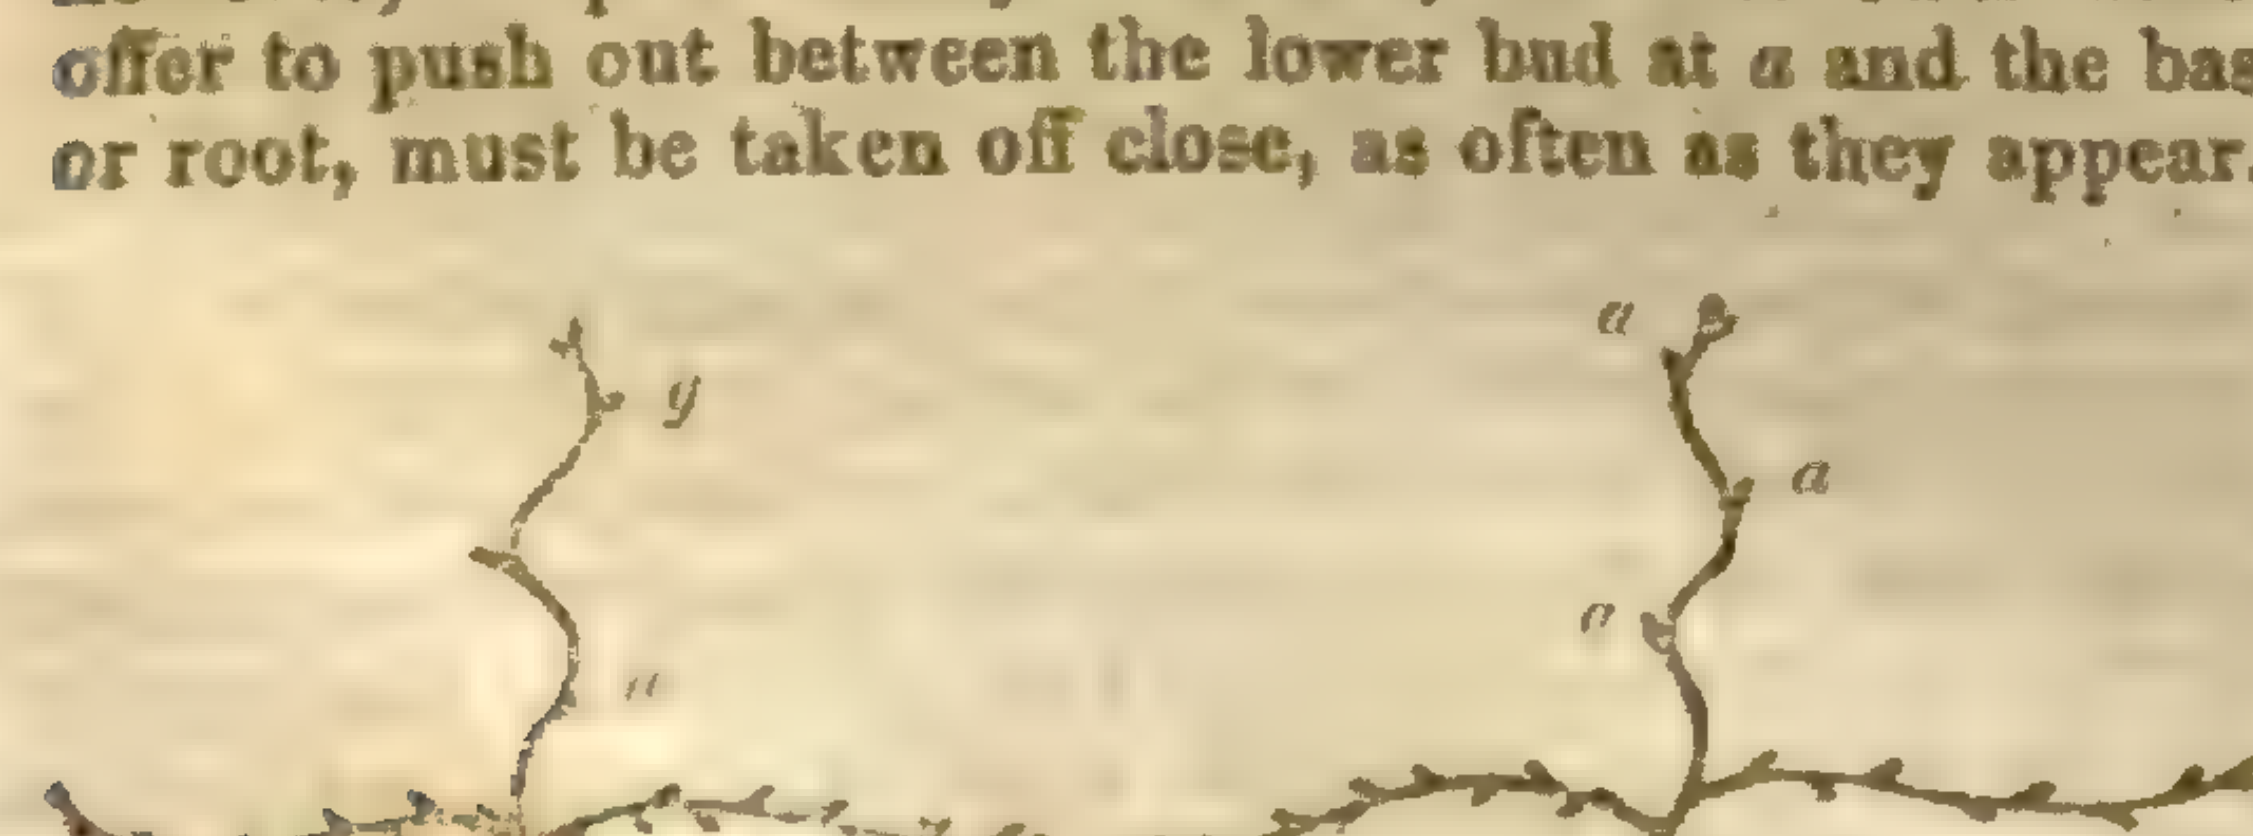
If, then, it be desired to train a Pear-tree on a Quince stock against a wall or a flat trellis, a plant should be obtained with two stems, thus—



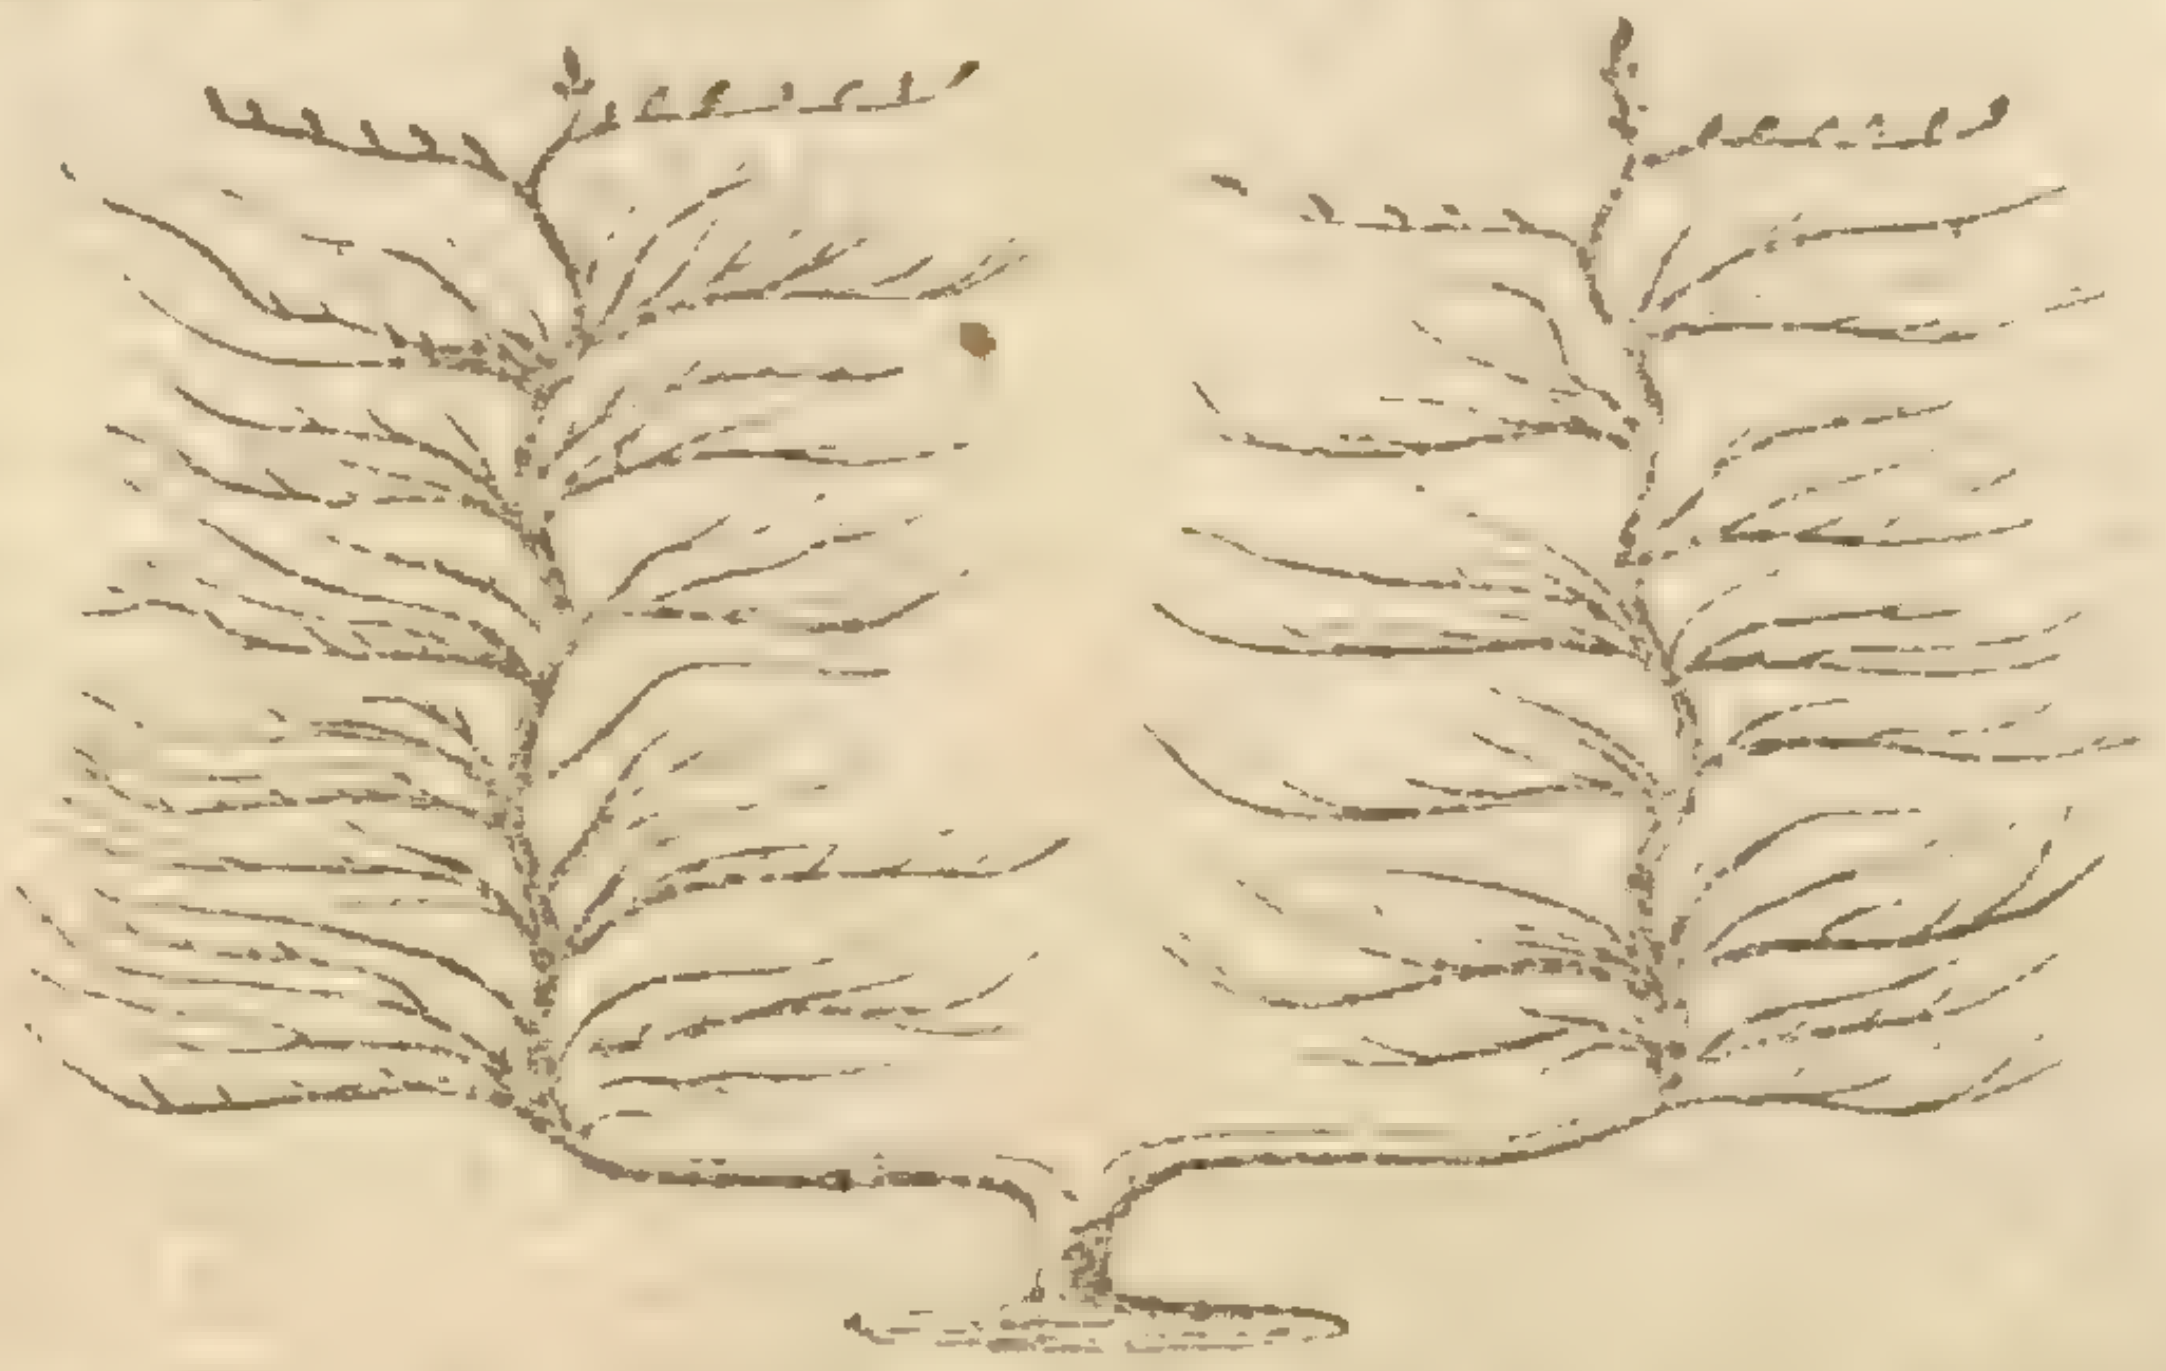
As such a tree may be expected to fill or cover with bearing wood a surface of 200 square feet, each original limb should be allowed from 8 to 10 feet; then, if the wall be 10 feet high, a surface of 200 feet will be provided. As soon as the branches have attained the length of 5 or 6 feet, they must be brought down, and fixed thus—



The following year the 3 buds at *a a* may each be expected to produce shoots of 3 to 5 feet long. It must, however, be particularly observed, that all buds which offer to push out between the lower bud at *a* and the base or root, must be taken off close, as often as they appear.

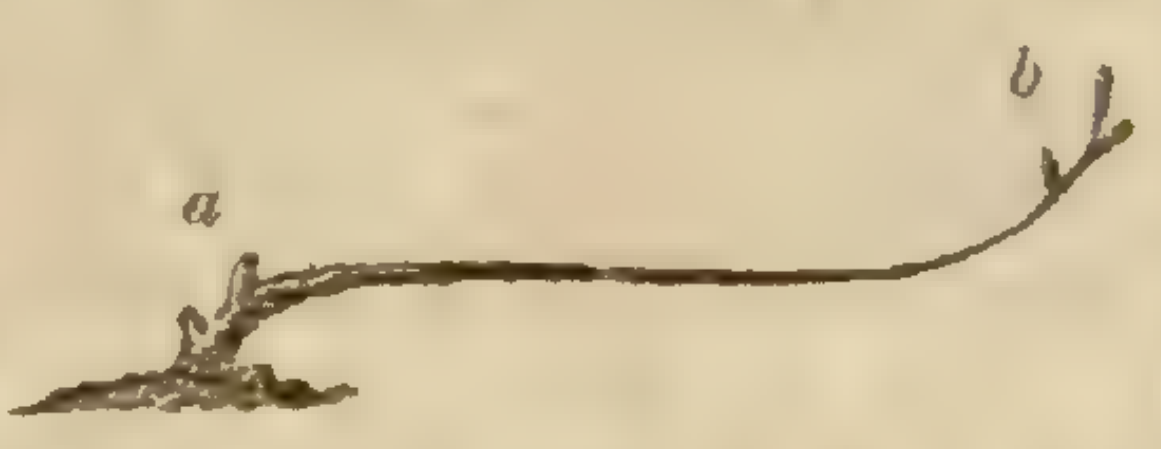


The following year, the branches must be fixed in this manner, and all the buds on the serpentine stems; but those marked *a*, and which will be required to form leaders, must be rubbed off as often as they appear; those on the horizontal leaders must be managed as it may appear necessary. If they throw out wood shoots where they are not required, these must be taken off close; but if they do not burst for wood, they may be permitted to remain to form fruit-buds. This plan followed year after year will ultimately produce a tree, covering the full space allowed, thus:—

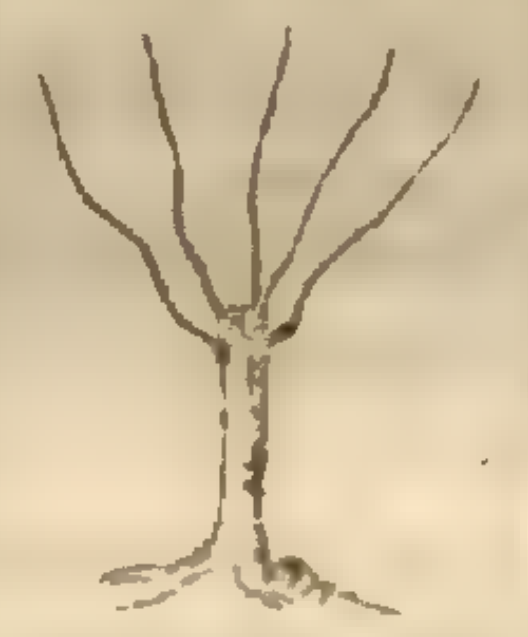


During the growth of the tree, all wood branches which push out from the outside or underside of the horizontal branches being rubbed off, and the young wood branches as they are formed from the upper side of the horizontals being trained in at full length, these will form fruit-buds, and remain as fruit-spurs for years. If a tree grows too luxuriantly to wood, enough of the strongest young branches nearest the perpendicular stem may be suffered to remain as waste pipes, and can be cut away at the winter pruning. As these will always push out, and may be trained up close to the stems, they will neither disfigure the tree nor overshadow the fruit.

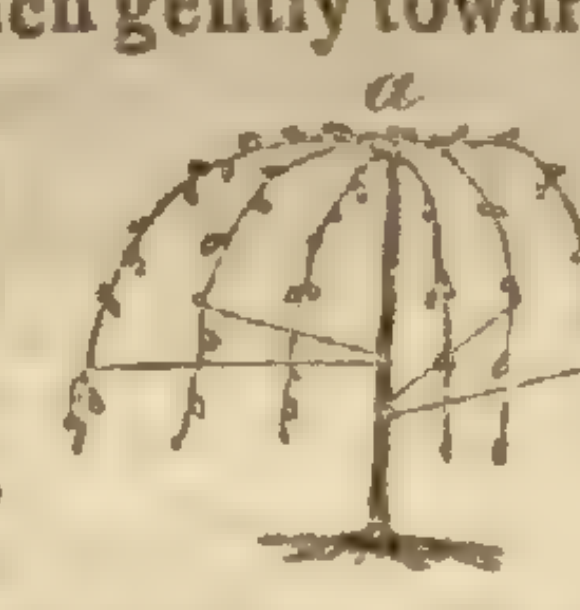
When trees with two equal stems cannot be obtained, those with one stem may be brought to produce another stem without cutting back. If a stem be brought down and fixed in this manner, a bud will be protruded at *a;* and if this be trained up, and all others that may be put forth between that and those at *b* be rubbed off, this will, in the course of a year or two, attain a size and strength equal to the first stem. When this has attained the same size, if it be bent down in the same manner on the opposite side, each stem will obtain the same supply of sap, and a tree as uniform in figure and produce will be acquired, as if it originally possessed two equal stems.



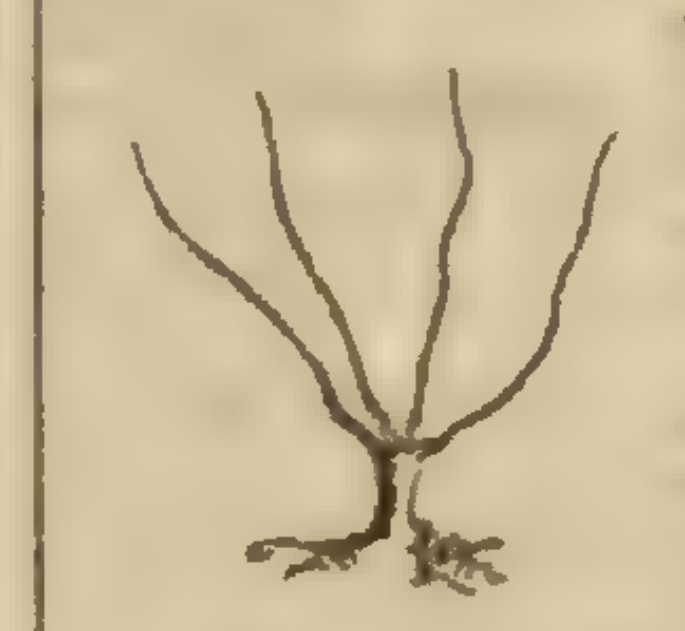
When trees are desired to form dwarf standards, the following plans are both well adapted for the purpose. Let a plant be obtained of about four feet high in the stem, and as many branches as may be on the top—thus:—



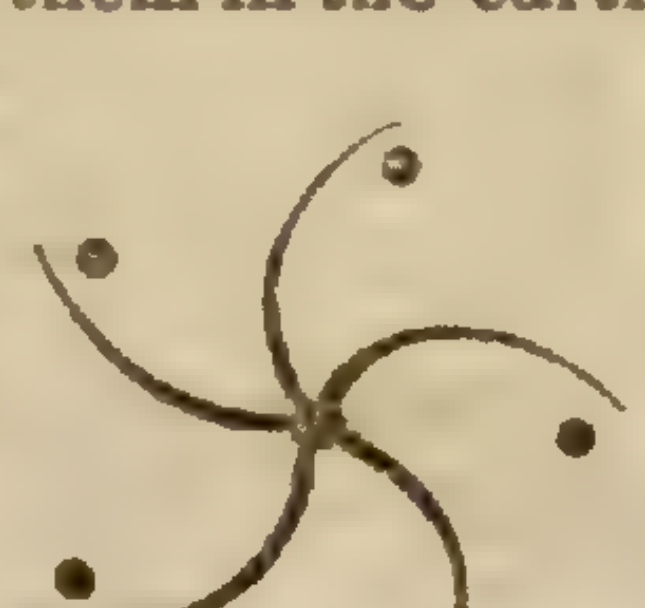
To train it, bend each branch gently towards the earth and fix them to the stem of the tree with some string or wire. The following year, conformably with the second law, the buds offering the most vertical channels at *a*, will throw out wood shoots. These shoots must be suffered to grow in their natural position until the autumn pruning, when such as can be found room for may be brought down and fixed alongside the original branches for fruit-bearers, and such as are not wanted may be cut away close.

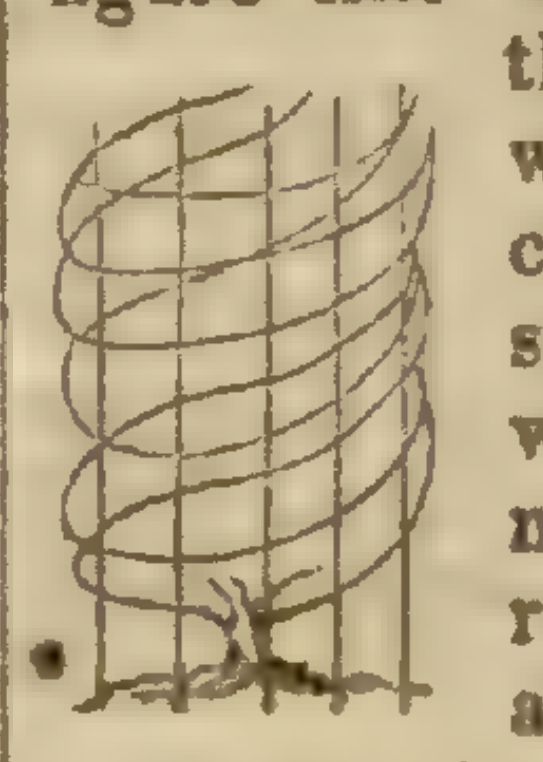


Another mode, equally conformable to the laws stated, is this:—Let a plant be obtained with three or more branches springing from within a few inches of the root. Then, being provided with five or six stakes, or—which is better—large rods of wire, affix them in the earth around the plant—thus:



Then, bringing the branches down, so as to lie on an angle of 45°, bend them round the circle of wire, so as to arrange them one above the other like so many corkscrews. They will then form a figure like this. It must be obvious that the branches being thus ranged, the sap will flow to the ends in sufficient quantity to continue to extend them, and the intermediate space will be furnished with fruit-buds. As some wood-buds will push out near the base, these may be allowed to grow erect in the centre, and remain for waste pipes, and can be cut out also at the autumn pruning.





As the Apple is subject to the same laws as the Pear, it may of course be managed in the same manner; but these, as well as Pears, on their own stocks, being apt to grow too luxuriantly to be confined in the same space for any great length of time, the better plan will be, when they discover symptoms of excess, to take them up and replant them, or cut off some of their roots.—*J. Hayward, Lyme.*

ON MANURING WITH GREEN CROPS—No. II.

[By Professor Sprengel. Translated from the German.

(*Continued from page 804.*)

Having now treated thus generally of green manure, I shall proceed to notice the plants which are ploughed in green. Their value is very different, depending (as in all manures) upon their chemical ingredients. I therefore consider it necessary to state, not only the amount of manure which each plant yields to an acre of land, but also its chemical constituents.

1. *Spurry* (Spergula arvensis).—The weight of herbage and roots of green Spurry grown on one Magdeburg acre is 3500 to 4500lb. 1000lb. of the green plant consists of

780·0 lb.	of water, in a fluid state.
4·0 „	nitrogen.
9·3 „	potash.
4·3 „	soda.
2·6 „	lime.
1·5 „	magnesia.
1·0 „	sulphuric acid.
1·5 „	phosphoric acid.
0·5 „	chlorine.
0·3 „	alumina, iron, manganese, and silica.
110·0 „	carbon, and
85·0 „	oxygen and hydrogen.
1000·0 lb.	

The organic substances which are to be found in Spurry, as well as in all other plants used as green manure, do not require to be taken into account, as they become decomposed by putrefaction into binary substances; it is merely necessary to know what the substances are which, after decomposition, actually nourish the subsequent crop. Water, however, although it does not belong to fertilising substances, must not be overlooked, because on its quantity (as may be easily understood) the value of the plants to be ploughed in is, in many respects, dependent; on which account I have mentioned it in this, as in all other cases.

If we assume that the green Spurry which is ploughed in will amount (conjointly with its roots) to 4000lb. weight on one acre of land, the increase which the soil of this acre obtains will be only 400lb. carbon and 16lb. nitrogen, because all the mineral substances which it possesses have been derived from the soil. We may even assume that Spurry deprives the soil of a great portion of carbon, and of some little nitrogen; and, therefore, that it is not a plant by which a soil will be much enriched. To this must be added that its roots do not reach deeper than 12 or 15 inches, so that it does not attract any considerable quantity of mineral substances from the subsoil. Nevertheless, it is worth while growing it in soils which possess but little humus, because the seed is not expensive (10 or 12lb. being sufficient per acre), and because it can be sown and ploughed in three times in one season. It is, however, to be observed that the second crop lives partly at the expense of the first, and the third partly on that of the first and second; on which account we must not expect from the two latter crops such a great improvement of the land as from the first.

Spurry succeeds only on dry, sandy, loose soils, on which alone it can be sown to advantage. I have tried several times to grow it for green manure on humous soils, but the result convinced me that it was not worth while. This is most probably because it does not bring up mineral substances enough from the sub-soil, that its proportion of nitrogen is too scanty, and that the humus which results from its decomposition is useless, because the soil has enough of that already. Spurry is mostly used for green manure in autumn; it is sown in fields which have borne Rye; it is ploughed in, and Rye is sown again, which in sandy soils is continued for several years; but every two or three years dung is to be used into the bargain. We know that Spurry, considered as a fodder, is the blessing of sandy soils; yet it will not succeed in all sandy soils, which is caused by their different chemical composition, one being deficient in potash, another in manganese, or other substances required for its growth.

If Spurry is used as green manure, we must guard against its being left standing till its seed begins to ripen, because, then, if it is not well ploughed in, it will spring up and choke the young Rye. It will, indeed, die by the frost of winter; but it injures the Rye materially, even in autumn. Before ploughing in (which is done to the depth of three or four inches) it is harrowed over. The field can be planted immediately after with Rye, as Spurry does not contain any substance which, before decomposition, can injure that crop.

(*To be continued.*)

AMATEUR'S GARDEN.—No. L.

Those who live in parts of the country where the winters are mild—such, for example, as the southern counties of England, or the eastern or western, near the sea-shore,—on the banks of the Firth of Forth in Scotland, and in most parts of Ireland—have the means of growing in the open air many kinds of ornamental plants which are too tender to flourish in more inland situations. In proof of this, I may refer to the answers to correspondents, a week or two since, where a list of Chinese Azaleas was given to a lady, who informed the Editor that the common Indian white and purple kinds succeeded perfectly in her garden in Devonshire, without any kind of protection. In a climate of this description, many other beautiful plants would succeed equally well, and would amply reward the amateur for any labour or care bestowed upon them. The finer varieties of hybrid Rhododendrons would do well in such places; and even Caméllias would succeed, if planted in front of a south wall, or otherwise sheltered. Fúchsias also stand well, particularly if the more hardy varieties are chosen, such as F. díscolor, F. Riccartónia, and many of the older hybrids. The Mexican and Peruvian kinds in cultivation—F. microphylla, F. fulgens, F. corymbiflora, F. cylindrácea, F. splendens, and their hybrids—are more tender, and are therefore not so well adapted for exposure in the open ground in winter.

I know of nothing more beautiful in a small or large garden than a clump of hardy or half-hardy Heaths. I remember well to have seen a clump of this kind several years ago in the Botanic Garden at Edinburgh. In the early spring months, when few flowers of any other kind were to be seen in the open air, there these Heaths were blooming as profusely and as beautifully as if they had been nurtured beneath the sunny skies and in the mild air of the South of Europe. The best varieties for a small clump are the following: Erica arbórea, E. australis, and E. mediterránea, for the centre; and E. cárnea—which is a very dwarf variety—for the edges. Menziésia, a genus very near Erica in its structure and habits, contains two or three species particularly well adapted to form part of the Heath clump. Their names are M. polifólia, M. polifólia alba, and M. cærúlea; they are all dwarf, and should be planted near the edges of the clump.

The general treatment which these plants ought to receive, with regard to soil and planting, is much the same as was formerly fully described when a clump or border for Rhododendrons was brought under the notice of the Amateur. In planting Heaths, great care should be taken that the neck of the plants—that is, the point between the stem and root—is raised a little *above* the surface of the ground. Any of the plants here recommended may be planted in the autumn or winter in mild situations, but the operation should be deferred until spring in those parts where the winters are more cold.—*R. F.*

HOME CORRESPONDENCE.

Experiments with Guano and Nitrate of Soda.—In the spring I manured both Peas and Beans with guano and nitrate of soda, by strewing them over the seed on separate rows at the rate of 1 lb. to 10 yards. The rows dressed with guano produced double the crop of those manured with nitrate of soda; in fact, there was a better produce upon other rows which had been left untouched. The haulms were too strong to bear well; probably I used too much nitrate. Upon Cabbages, neither of the above manures appears to have any effect, but horn-shavings suit the whole tribe extremely well. In March, I applied 6 lbs. of nitrate of soda to two Asparagus beds, each of which was 5 yards long and 4½ wide; two others were in like manner dressed with guano, all the beds being of equal age and strength. The latter manure has not yet produced any visible effect; but the nitrate has rendered the plants more vigorous, and seems to be very beneficial. In June last, I planted 6 rows of Celery, manuring 2 with guano, at the rate of 2 lbs. to 10 yards, on each side of the rows directly after planting; 2 with nitrate of soda; and 2 with stable dung, 6 inches thick beneath the plants. The first two rows were inferior to both the others, but better than a row which received no dressing at all; the other four were fine and equally good. In May, I manured a few acres of Grass, which were standing for hay, with nitrate of soda, at the rate of 1½ cwt. per acre, another portion with guano applied at the same rate, and a third with good farm-yard dung (worth *5s.* per ton) at the rate of 7 tons per acre. The former produced the heaviest crop of hay; the guano proved more serviceable than the dung; and after the hay was cut, I could at the distance of half a mile distinguish where the soda had been applied, by the dark colour of the Grass, which was also eaten closer than the rest by the horses. I mixed two pounds of guano with a bushel of light loam for plants. Some well-rooted Pentstemons which were pitted in it, died in less than a fortnight after; some Pelargoniums also became sickly, but did not die. An Epiphyllum and some Cactuses grew vigorously in it, and several Fuchsias have done extremely well. A bed of Verbena melindres was watered, at the latter end of May, with water in which nitrate of soda had been dissolved, at the rate of a large table-spoonful to every half-gallon. The plants grew much faster, and were in full bloom almost before any of the other beds, which were watered with water alone, had begun to flower. An Abies Deodara was also watered with nitrate of soda dissolved in water, at the rate of 4 oz. to the gallon; it grew much faster and stronger than another plant of the same kind which was near it. They were both in the same kind of soil, but I must allow that the one operated upon was the larger plant; but it certainly derived a benefit from the nitrate, as it became of a much darker colour than the other in less than a week after, and remained so all summer.—*Henry Ford, Sheaf House, Sheffield.*

Potatoes.—I find that at p. 806 you have made a mistake in the number of Potatoes planted by Mr. W. Hodgson, which should have been 20 instead of 24: these, being each cut in two, would give 48 sets, which would only average 15 lbs. each, and would be 7½ lbs. less in weight per root than those mentioned at p. 781 of last year. Whereas, the 20, being cut in two, would give 40 sets, averaging 18lbs. per root, which is 4½lbs. less than the ones above mentioned.—*M. Saul, Garstang.*

Cause of Failure in Mushrooms.—A notice appeared from *J. D.* at p. 712, respecting the failure of his Mushroom beds, which you attributed to the wood, of which the shelves are composed, having been kyanised previously to being used. As he has not satisfied us on that point, we may conclude that in his case the wood was so prepared, and consequently, that his crops failed from the effects of such preparation. But with me the case is quite the reverse, the woodwork of my Mushroom beds not having been kyanised; yet precisely the same kind of failure as *J. D.* describes has repeatedly taken place. After the beds have borne abundantly for a few weeks, the Mushrooms suddenly turn soft and leathery, and not one of them is fit for use. The first bed which went off in this way, some few years since, I concluded to have received a sudden chill, which I thought from some cause or other might have taken place; and I tried to recover them by raising the temperature in a slight degree. This, however, produced no good effect. If at any time I have found the beds too dry, I have given them a slight syringing with warm water; after which, no matter how small a quantity of moisture may have been applied, the result has invariably been the same—the Mushrooms have turned black, and become rotten; and I have never known a single instance in which a bed has done any good afterwards. After repeated trials to discover the cause of the evil, and to apply a remedy to prevent its occurrence, I have come to the conclusion, that the chief cause of the mischief complained of is the exhaustion of the beds; as this appears to me to be the last effort of the vegetative powers of the spawn to produce Mushrooms, I have always observed that the beds which have gone off in this way have been such as have borne the most abundant crops, and have been worked at the highest temperature. I always break up such beds now, and make fresh ones, as I find it the only effectual means of keeping up a supply. Perhaps some more able correspondent will be enabled to give a more satisfactory account of the matter in question, and at the same time point out a method to prevent its occurrence. My house is built on the Oldacre principle, with tiers of shelves on the back part only; it is heated by hot water, but this I seldom have recourse to, as, in a general way, the temperature is maintained sufficiently high without its use.—*C. J.*

Shallots.—You tell "J. J." that he must have taken up his Shallots before they were ripe, because they shrivelled. I think the one is by no means a consequence of the other. When I have grown Shallots in a sandy soil, I have always found them shrivel; but not so (with the same management) when grown in strong soil.—*B. M.*

Large Turnips.—Two turnips, raised from seed of the White Norfolk, were lately taken up from a field belonging to T. Scott, Esq., of Greystoke. Their united weight was 5 stone 2lbs. The largest measured 3 feet 7 inches in circumference, and weighed 2 stone 10lbs.—*M. Saul, Garstang.*

To Preserve Carrots from Wireworms.—As the season is now arrived when most gardeners are preparing ground, by "digging and trenching," for the reception of different sorts of culinary seeds in spring, I would recommend those who have of late failed in the culture of Carrots to adopt the following mode, which I have seen practised with success, and which, I have no doubt, will be found a preventive against the wireworm. Trench the ground two spades deep (throwing it up in the ridge manner), allow it to remain so until the time that it is prepared for the reception of the seed, then level the ridges and give them a very slight coat of pigeon's dung all over, which should be pointed and worked well into the ground; sow the seed and cover it in the usual manner; afterwards top-dress the ground with sand well saturated with spirits of tar. By so doing I am sure that those who adopt the plan will, when the plants are taken up, be gratified to find that the roots do not present the slightest trace of the wireworm. This I have seen practised (more than once), and the result always proved satisfactory. The quantity of spirit of tar used was a gallon and a quarter to every eighty square yards.—*A Rosshire Gardener.*

To Destroy Slugs.—During the years 1840 and 1841 my garden, which is composed of a stiff clayey soil, was so infested with slugs, &c., that my Potatoes were almost destroyed, many of them being completely hollowed out, and all more or less eaten and disfigured. I tried soot and salt, without any visible effect in eradicating the marauders. Last February I had lime brought direct from the kiln, slaked on the ground, spread thinly over it, and forked in whilst hot; the result has been most satisfactory, my Potatoes turning up clean, and an excellent crop, in spite of the dry weather.—*W. W.*

Beans and Gooseberry Caterpillars.—Garden Beans are not always a preventive to the attack of the Gooseberry caterpillar. A neighbour of mine, who had been for several years much annoyed by having his crops of Gooseberries destroyed annually by the caterpillar, having heard of the Bean cure, determined last Spring to check them if they should make their appearance; and in order to meet the enemy in close quarters, he had some long-pod Beans planted below each bush: these in due time occupied the field; but, alas! by Midsummer the unfortunate bushes fell a prey to the above garden pest, which soon stripped them of almost every leaf, while the Beans stood idle lookers-on. I could mention many similar instances—*J. Alexander, Carlon Gardens.*

The Tipula oleracea.—Facts relating to Natural History, however apparently trifling, may, when combined with others, become important; and a better knowledge of the habits of the Tipula oleracea would probably enable us more effectually to check the ravages which are made in our gardens by its larvæ. With us a few of these Crane-flies occasionally appear in March, but they are never at all abundant till towards the middle or end of September; several at that period usually continue for about a month to issue daily from the pupa state. Very few were, however, seen this autumn till the morning of Monday, October 31st, when at sunrise I found the south front of this house to be almost covered by them; although I had happened to observe that not one was there at the preceding sunset: they were swept off and destroyed by thousands, so that none were left in the evening. This front comprises about 4,000 square feet, and though the flies were much less thickly dispersed over the upper than in the lower half, I doubt whether the average number could be so much short of three on each square foot as to make their total amount less than 10,000. The light stone-colour of the house appears always to attract them. At daybreak on the following Tuesday I again found on my south front a comparative few, although they then amounted to many more than I had ever seen together in any former autumn; only some half-dozen stragglers have been seen on any day since. On both these mornings, about two thirds of the flies were paired, and nearly all those which remained single in the vast swarm on Monday were females; but both sexes were, I believe, nearly equally numerous on the Tuesday. Till this swarm arrived, the comparative scarcity of these pests had led me to hope that the unusually long drought had destroyed the larvæ; and I can now only conjecture that it may have driven them to a greater depth in the earth, and thus have retarded their change to a pupa state. The temperature also may have had some effect, for my thermometer at sunrise on the Monday was 51° and on Tuesday 50°, which is several degrees higher than it had been at the same hour throughout the preceding fortnight.—*L. W. D., Sketty Hall.*

Rats.—I shall feel beyond measure thankful to any correspondent who can put me upon a plan for destroying rats. I must enter a caveat against the fishing method mentioned in your Paper of the 26th inst., having seen it repeatedly but unsuccessfully tried by many of my schoolfellows, some of whom were no mean fishermen, if I might judge from the number of trout they took from the river Ex. I should just as soon think of making a planetary gin for these nocturnal—ay, and diurnal depredators. There seems to have been some method of destroying rats communicated to the Royal Hort. Society; do you happen to know what it is?—[We know nothing of this. Rats may be largely destroyed by the method mentioned at p. 629 of last year. Can you not give them sulphuretted hydrogen, as named at p. 199? Have you turpentine?]

Root-pruning Pear Trees.—In the Calendar of Operations a few weeks since, Mr. Whiting tells your readers to try Pears "en quenouille" on Quince stocks, and directs them to tie their branches down, so that "a fruitful habit may be induced." If he had seen, as I have, even on moderately moist and rich soils, the very luxuriant growth of Pears on Quince stocks, he would know that, when trained "en quenouille," unless they are checked at the root they will form a mass of leaves and shoots, and produce but very little fruit. In many of the French gardens, those tall columns, barren of fruit, but fruitful in foliage, are conspicuous enough. A French book called, I think, "Le Jardinage," published early in the last century, came into my hands a short time ago. The author enters fully into the culture of Pears, and in one passage cautions his readers, if they train their Pear trees "en quenouille," against letting them remain too long in one place; "for," says he, "it is only by timely removal that your tree can be kept in its proper form, and be made very fruitful." Those who wish to have prolific trees "en quenouille," must resort to other means than merely tying their branches down.—*Radix.*

Preserving Fruit.—Some queries have appeared in the *Gardeners' Chronicle* as to the best mode of preserving fruits in a fresh state without sugar. Of those put up for sale it may be fairly said, that the flavour is not equal to the appearance; but the manner in which they are preserved, and the mode mentioned below, are described in Appert's work, published at Paris in 1810, which was soon translated into English. This well-known work includes animal and vegetable substances. For full details the work itself must be consulted. To preserve some common ripe fruits, such as Currants, Raspberries, and Plums, a few plain directions may suffice:—Take wide-mouthed glass, or, if possible, stone bottles; fill them by shaking, or even, if you like, by pressing them, or mashing them with a round stick like a ruler. Then cork them tight with the best corks, (for good corking is more than half the battle,) using good deep chives, as they are called; wire down the cork strongly, and insert a small slip of wood between the wire and cork. Place the bottles upright in a boiler, filled with cold water up to their necks; heat the water until it boils; keep it boiling ten minutes; and then withdraw the fire, or move the boiler off it. When the water is cool, take out the bottles, and they will keep for years. They may be rosined, but with good corks it is needless, and is afterwards troublesome. Currants should be gathered before they are too ripe, as the seeds then become hard; and if it is required to keep the shape of these, they should not be pressed, but the bottle should be filled up with Currant-juice, and not with water, as is done for sale. Celery, Mushrooms, Morels, Onions, and almost anything, may be kept thus. Green Peas are the most difficult vegetable to preserve by Appert's method.—*No Mystery.*

The Tendril of Vines.—I have watched with much interest, in its gradual progress towards maturity, a bunch of Grapes, which developed itself in a rather unusual manner; the shoot from which it emanated being a transformed tendril. The berries of the bunch in question are large, and not distinguishable in point of flavour and colour from others at present on the same Vine. Your correspondent, Mr. J. Murray, who doubts that the Vine tendril is indeed an abortive peduncle, from the supposition, that if such were the case, it would evince a want of evidence of creative design, takes a different view of vegetable transmutations from that of a recent physiological author, who says, "Art and means are multiplied, that we might not take the order of creation for the effects of chance; and, in some cases, the method itself is different, that we might see that it is not the effect of surd necessity."—*Thos. Cowan, Churchill Gardens.*—[There is no sort of doubt about the tendril of a Vine being a transformed bunch of Grapes; but we are glad to have this additional evidence to convince unbelievers.]

Germination of the Leaf.—It is known that various leaves will grow and produce other leaves, &c., but I know an instance of a leaf of the Hoya carnosa, which was planted in a pot; it produced fibres which composed a root, indeed; but it still remains only a leaf, though planted 9 or 10 years ago!—*J. Murray.*

Sporting of Colour in the Hydrangea.—A singular instance of sporting in a plant of Hydrángea hortensis has lately come under my notice. Five flowers on the same branch were of the proper colour, and the sixth was quite blue; but the blue flower was the most vertical one on the branch. What theory is to account for this? Pink flowers or blue flowers we can produce at will, but to have both colours on the same branch appears to be one of those freaks of nature which are almost inexplicable. As the cause of blue flowers is yet unexplained, perhaps my solution of the problem may not be without interest. Some years back, I had the curiosity to get two kinds of soil analysed, one of which produced blue flowers, and the other pink; the only difference in the component parts of each was, that the soil which produced blue flowers contained a small portion of oxide of iron. The inference drawn by the chemist from a slight examination of the plant was, that it contained prussic acid, and that the iron combining with the acid in the plant formed Prussian blue, and hence the colour of the flower. This is the theory of a country chemist, and whether it be true or not, it is certainly the most plausible that I have seen advanced. The only way of accounting for the pink and blue flowers on the same branch, is to suppose that the roots in immediate connexion with the blue flower were in contact with oxide of iron in the soil, and hence the change chemically, according to the above theory. Stiff soil, strongly impregnated with iron, produces flowers of the most intense blue. Has it ever been noticed, that the same soil which creates the blue in the Hydrangea, produces the deep rose-purple flowers so desirable in Primula sinensis? at least I have found it so.—*W. P. Ayres, Chicksands.*

Amaryllis Belladonna.—I often wonder why that beautiful autumnal flower, the Amaryllis Belladonna, is not more frequently grown, as it requires so little trouble. I have a great number of them planted close to a south wall; they are never protected and have not been replanted for several years, and have had upwards of 200 spikes of flowers, continuing in bloom for two months. Some bulbs which I have planted close to an early forced Vinery flower in July; while those which are planted against the south wall begin to flower in August and last till the middle of October; they make a beautiful appearance.—*Caleb Diplock.* [We wonder too; this is the most beautiful of all autumn flowers.]

Pale Primroses.—Your Correspondent who inquires, at p. 789, respecting the passage in Shakspeare's "Winter's Tale," does not as yet appear to have met with a reply: nor is it, perhaps, easy to furnish him with a decisive one. I cannot admit the conjecture, that Shakspeare wrote "tall," and not "pale" Primroses, meaning thereby the Oxlips; the epithet would of itself convey an unpoetical sound. Moreover, Perdita immediately adds, "bold *Oxlips*, and the Crown Imperial." Your Correspondent will find in Steevens's note upon the passage in question, and more especially in Warton's to Milton's Lycidas, 142, all the passages from our early poets which bear upon the point, as well as a sufficiency of explanatory matter. It certainly appears to me, that taking the whole together, Shakspeare's words in the "Winter's Tale" are perfectly intelligible; for if we were to seek for a flower merely emblematic of the early death of a fair unmarried damsel, where can one be found more appropriate than the Primrose? Its fragrance, beauty, humble and bashful appearance, its delicate languor and paleness, and its early departure in the very spring-tide of the floral year, all obviously mark out the resemblance. Poets, the worshippers and interpreters of nature, cannot be too accurate in the objects they describe; but they must not be too minute; minuteness is inconsistent with the genius of poetry, although it is the essence of physiology. I cannot, therefore, subscribe to the doctrine, that we are to seek a foundation for Shakspeare's assertion, that Primroses "die unmarried," in the very recondite and uncertain circumstance of whether winter Primroses can or cannot bear seed.—*Florizel.*

A Problem in Cookery.—Respected Sir, I am not a subscriber to your Paper, but I am told that you have a most obliging way of answering all reasonable questions which may be proposed to you, respecting fruits, flowers, and vegetables. The difficulty under which I at present labour has cost me much anxious consideration, as I dare say it has to every good housekeeper in the kingdom. I have made many attempts to solve it, but hitherto without success. Last year I consulted a very eminent apothecary from London, and a distinguished physician from the North of England, but unfortunately their opinions were directly at variance. I then applied to an exceedingly intelligent young man, who had just been elected honorary secretary to our scientific institution, and he assured me that the question had never been decided; that it formed, in short, the opprobrium of modern philosophy. On this statement I was fain to rest satisfied with my ignorance, till a few days since, mentioning the matter to a gentleman who keeps up the finest gardens in this part of the country, he told me that if anybody in existence could remove my doubts, it was you. I would not have presumed to trouble you on my own account alone, but for the benefit of my contemporaries, to say nothing of posterity. Will you inform me whether the inverted cup, usually placed in a currant tart, does really save the juice from boiling over?—*An Old Lady.*—[We cannot refuse this pathetic appeal, and for the sake of all the "old ladies" in Great Britain will do our best to answer it. Not having, however, like the "four-and-twenty blackbirds," the faculty of being "baked in a pie," and coming out to sing, we cannot give any opinion founded on actual observation. We have frequently heard the matter discussed after dinner, in such a manner as to prove that the young secretary was not altogether wrong, and that it is one of those *vexatæ questiones* which admit of much being said on both sides. Those who contend for the saving qualities of the cup, are generally practical philosophers, who refer indignantly to the flood of juice which escapes when the cup is lifted, and stigmatise their opponents as mere theorists, who, like Bishop Berkely, reject the evidence of their senses, and would demand proofs of their own existence. So much irritation has occasionally been excited by these tart controversies, that had the question been mooted in the dark ages, it would doubtless have been long since settled by the all-convincing fires of the Inquisition, which might obviously have been so managed as to combine a most appropriate punishment for such a heresy, with ocular demonstration of the disputed fact—an advantage never before offered to a dissenting philosopher. Nor is there any reason why baking in a pie should be a less efficient or less dignified sort of martyrdom than broiling on a gridiron, which last we know to have been practised with the greatest success, though destitute of that peculiar fitness which may be claimed for the plan under consideration. Begging pardon for this digression, which has disturbed the calmness due to such an inquiry, we find that we cannot now sufficiently collect our thoughts to do it justice. We will shortly resume the subject, and if in the mean time any of our numerous correspondents will favour us with their views, we will endeavour to make them useful to our fair questioner.]

Weight of Poultry.—I beg to inform a subscriber who wishes to know the greatest weight of the common English duck, with the view of obtaining the best sort, that, as a fancier of poultry, I have been at some trouble in trying different sorts of ducks, and I find none equal to the Aylesbury. I bought some at Baily's, poulterer, Davies-street, Berkeley-square. When true, they are perfectly white, with orange legs, and flesh-coloured or white beaks; and in September, the earliest young birds weigh alive and empty 4½ lbs. each, which is a great weight. I believe the Rouen duck, which is brown, is larger but not near so nice-looking as poultry, and I doubt whether it is as tender; the Aylesbury continue so until Christmas. They begin to lay very early; my plan is to put the first eggs under hens, say six duck eggs and five hen's eggs; thus procuring both early chickens and ducklings. The ducks continue to lay eggs, so that I thus get four or five hatches from each duck. To fatten them, I merely put them into a small yard and feed with oat or barley meal paste and corn.—*Geo. W.*

Fir Trees.—The Rev. R. W. B. wishes for information respecting the unusual decay, and weakly appearance, on his grounds, of Scotch Fir trees, which until the present year have been most luxuriant and flourishing. In many cases, those presenting these unhealthy signs are standing close to others which are strong and vigorous; thus making this appearance of decay the more remarkable. The plantations in which these symptoms occur have been made 20 or 30 years. Would the application of nitrate of soda be likely to have any salutary effect? Perhaps some of your correspondents have observed instances similar to the foregoing.—[Will some of our correspondents be so obliging as to favour us with their experience upon this point?]

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

EVENING MEETING, *Dec. 7.*—The Duke of Richmond having briefly introduced Dr. Lyon Playfair, the latter gentleman commenced his lecture. He stated that the object of the lecture was to point out in what manner the principles of physiology, especially those which had been lately developed by the chemical researches of Liebig, might be applied to the grazing and fattening of cattle. In the first place, he should endeavour to give a clear conception of what the principles of physiology were, that were involved in the feeding and growth of animals. Vegetables, in their growth, derive all their food from the mineral kingdom, principally from the air, which had been called a gaseous mineral; whilst animals derived their principal nutriment directly from the vegetable kingdom. Vegetables effected many chemical changes in the food they took up, animals few. Gluten and albumen are the nutrient principles of plants, and in chemical composition they are identical with the albumen of the white of an egg, of the muscle of an ox, or the blood of a sheep. By identity was not meant similarity, but positively the same thing. The albumen of blood, of muscle, and of an egg differed in physical but not in chemical characters. The composition of these substances, as analysed by various chemists from the animal and vegetable kingdom, as seen in the following table, prove their identity.

	Gluten. Boussingault.	Casein. Scherer	Albumen. Jones.	Ox blood. Playfair.	Ox flesh. Playfair.
Carbon	54·2	54·1	5·5	54·10	54·12
Hydrogen	7·5	7·1	7·	7·5	7·89
Nitrogen	1·4	15·6	15·7	15·72	15·71
Oxygen	24·4	23·2	22·1	22·59	21·56

These analyses do not differ more than the analysis of the same substance. Plants, in fact, contain within them the flesh of animals, and all the animal organisation does in nutrition, is to put this flesh in the right place. But animals take up with their food other constituents of plants, which contain no nitrogen; such are starch, sugar, gum, &c. These are not nutritive principles; they do not assist in making the flesh of animals; and when animals are fed on these alone, they die. But animals possess a certain degree of heat, and their bodies have generally a temperature above that of the atmosphere—about 100° of Fahrenheit's thermometer. Whence then comes this heat? From the burning of the sugar, starch, gum, &c. The air that animals expire is carbonic acid, the very gas that is produced by the burning of wood or charcoal in a fire. Charcoal is carbon, and animals take in daily a large quantity of carbon in their food. It is the burning or combustion of this substance in the body, that produces animal heat. In hot countries, animals on this account take less carbon. The food of the East Indian contains only about 12 per cent. of carbon; whilst that of the Greenlander contains 70 per cent. The depraved taste of the Greenlander, who drinks train-oil and eats tallow-candles by the dozen, might be pitied or wondered at; but it is necessary to his healthy existence. Another reason for animals acquiring carbonaceous food in cold climates is, that the air is more condensed, and the same measure contained a greater quantity of oxygen; that gas being the agent which, by uniting with the carbon and forming carbonic acid, gave out the heat. Strong exercise also demands a large supply of carbonaceous food, on account of the oxygen taken in during the hard breathing thus produced. Oxygen, when once taken in to the system, never escapes uncombined, and would destroy the whole fabric of the body unless a fresh supply of material was given. Clothes, by keeping in animal heat, rendered less carbonaceous food necessary, in order to keep the body up to its proper temperature. The following table exhibits the principles of food necessary for the two great processes of life—nutrition and respiration:—

Elements of Nutrition.	Elements of Respiration.
Vegetable Fibrine	Fat
,, Albumen	Starch
,, Casein	Gum
Animal Flesh	Sugar
,, Blood.	Wine
	Spirits
	Beer.

If it were not for some power or force within the animal fabric, it would soon become a prey to the chemical action of oxygen. The force that withstands this action is vitality—a principle independent of the mind, and which constantly opposes the destructive chemical laws to which the body is subject. Disease is the temporary ascendancy of the chemical over the vital force. Death is the victory of the chemical force. A dead body exposed to the action of oxygen is soon resolved into its primitive elements—carbon, hydrogen, and nitrogen, in the form of carbonic acid, ammonia, and water; and these are the elements from which plants again prepare materials for the living body. These remarks will explain many facts known to the agriculturist, and will assist him in insuring more certainly many of the objects of his labours. It is very well known that cattle do not fatten so well in cold weather as in hot. The reason is this:—The fat is a highly-carbonised substance, formed by the animal from its carbonaceous food. In cold weather, the carbon in this food is consumed in keeping up the heat of the animal, which is at that season more rapidly carried off. This is also illustrated in an experiment made by Lord Ducie at Whitfield. One hundred sheep were placed in a shed, and ate 20 lbs. of Swedes each per day; another hundred were placed in the open air, and ate 25 lbs. of Swedes per day—yet at the end of a certain period the sheep which were protected, although they had a fifth less food, weighed 3 lbs. a head more than the unprotected sheep. The reason of this is obvious: the exposed sheep had their carbonaceous food consumed in keeping up their animal heat. Warmth is thus seen to be an equivalent for food. This is also illustrated by the fact, that two hives of bees do not consume so much honey when together as when separate, on account of the warmth being greater; and they have less occasion for consuming the honey, which is their fuel. Cattle, for the same reason, thrive much better when kept warm, than when exposed to the cold. The cause of animals getting fat is, that they take in more carbonaceous food than they require for producing animal heat; the consequence is, that it is deposited in the cellular tissue in the form of fat. Fat is an unnatural production, and its accumulation is not necessary for securing the health of the body. When stored up, however, it will serve the body for keeping up its animal heat, and by this means its life, till it is all consumed. An instance is related of a fat pig having been kept without food for 160 days, having been kept alive by its own fat. Another element necessary to be taken into consideration in the fattening of animals is motion or exercise. Every action of the body—nay, every thought of the mind, is attended with chemical change; a portion of the deposited tissues are thus being constantly consumed. It is on this account that when animals are fattened, they are kept quiet and still. The cruel practice of fattening geese by nailing their feet to the floor, and of cooping pigeons and chickens before they are killed, arises from a knowledge of this fact. When prizes were given by our agricultural societies for fat, and not for symmetry, animals were strictly prevented from taking any exercise at all. Mr. Childers found that sheep which were kept warm and quiet, fattened much faster than those that were allowed the open air and action. It is very difficult to fatten sheep and oxen in July, on account of the flies, which stinging them, keep them in a state of constant motion. The Cornish miners, on account of the laborious nature of their occupations, consume more food than labourers with lighter work. During the late riots in Lancashire the poor unemployed operatives found out that exercise and cold made them hungry; accordingly, they kept quiet in bed, and heaped upon themselves all the covering they could find. Englishmen in the East Indies are obliged to take a great deal of exercise, because they will insist on eating and drinking highly-carbonised foods; and the heat of the climate not allowing the escape of much heat from the body, they are obliged to take in by exercise the oxygen of the air, in order to destroy the carbon which would otherwise accumulate in the system, and produce liver disease. In the Scotch prisons, the quantity of food given to the prisoners is regulated by the kind of work on which the prisoners are engaged, the hardest workers having the most food. The reason of the flesh of the stag becoming putrid shortly after its death arises from the quantity of oxygen which it takes into its system during the hard breathing of the chase. A hunted hare, for the same reason, is as tender as one that has been kept for a fortnight after being shot. The reason is the same. In both cases, the action of the oxygen on the flesh produces approaching decomposition—in the one, quickly; in the other, slowly. Bacon, on the same principle, was, at one time, rendered more delicate by whipping the pig to death. Epileptic fits produce great emaciation, on account of the violent action to which they expose the body. Lord Ducie has performed some experiments highly illustrative of the foregoing general principles, and which also indicated what might be expected from their application to the practice of grazing. *1st Experiment.* Five sheep were fed in the open air between the 21st of Nov. and the 1st of Dec.; they consumed 90 lbs. of food per day, the temperature of the atmosphere being about 44°. At the end of this time they weighed 2 lbs. less than when first exposed. *2d Experiment.* Five sheep were placed under a shed and allowed to run about, at a temperature of 49°; they consumed at first 82 lbs. of food per day—then 70 lbs.—and at the end of the time had increased in weight 23 lbs. *3d Experiment.* Five sheep were placed in same shed as in the last experiment, but not allowed to take any exercise; they ate at first 64 lbs. of food per day—then 58 lbs.—and increased in weight 30 lbs. *4th Experiment.* Five sheep were kept quiet and covered, and in the dark; they ate 35 lbs. a day, and were increased 8 lbs. These experiments prove very satisfactorily the influence of warmth and motion on the fattening of cattle, and are still going on.

Dr. Playfair then stated that he should proceed to examin the different kinds of food of cattle. The food of cattle is of two kinds—azotised and unazotised—with or without nitrogen. The following table gives the analysis of various kinds of food of cattle in their fresh state:—

lbs.	Water.	Organic Matters.	Ashes.
100 Pease	10	80½	3½
,, Beans	14	82½	3½
,, Lentels	16	81	3
,, Oats	18	79	3
,, Oatmeal	9	89	2
,, Barley Meal	15½	82½	2
,, Hay	16	76½	7½
,, Wheat Straw	18	79	3
,, Turnips	89	10	1
,, Swedes	85	14	1
,, Mangel Wurzel	89	10	1
,, White Carrot	87	12	1
,, Potatoes	72	27	1
,, Red Beet	89	10	1
,, Linseed Cake	17	75½	7½
,, Bran	14½	80½	5

A glance at this table would enable a person to estimate the value of the articles as diet. Thus every 100 tons of Turnips contained 90 tons of water. But the value of the inorganic and organic matters which these foods contained differed. Thus Mr. Rham states that 100 lbs. of Hay were equal to 339 lbs. of Mangel Wurzel. It would be seen by the table that that quantity of Hay contained 76 lbs. of organic matter, whilst the Mangel Wurzel contained only 34 lbs. One result of feeding animals on foods containing much water is, that the water abstracts from the animal a large quantity of heat for the purpose of bringing it up to the temperature of the body, and in this way a loss of material took place. The mode proposed by Sir Humphry Davy of ascertaining the nutritive properties of plants, by mechanically separating the gluten, is unsusceptible of accuracy. The more accurate way is to ascertain the quantity of nitrogen, which being multiplied by 6·2, will give the quantity of albumen contained in any given specimen of food. The following is a table of the equivalent value of several kinds of food, with reference to the formation of muscle and fat; the albumen indicating the muscle-forming principle; the unazotised matters indicating the fat-forming principle:—

lbs.	Albumen.	Unazotised matter.
100 Flesh . . .	25	0
,, Blood . . .	20	0
,, Pease . . .	29	51½
,, Beans . . .	31	52
,, Lentils . . .	33	48
,, Potatoes . . .	2	24½
,, Oats	10½	68
,, Barley Meal . .	14	68
,, Hay	8	68½
,, Turnips . . .	1	9
,, Carrots . . .	2	10
,, Red Beet . . .	1½	8½

The analyses in this table are partly the result of Dr. Playfair and Boussingault's analysis, and partly Dr. Playfair's own analysis. The albumen series indicate the flesh-forming principles, and the unazotised series indicate the fat-forming principles. By comparing this table with the former, it will at once be seen which foods contain not only the greatest quantity of organic matter, but what proportion of this organic matter is nutritive and which is fattening; or that which furnishes living tissue and that which furnishes combustible material. In cold weather those foods should be given which contain the larger proportion of unazotised matters, in order to sustain the heat of the body. Thus it will be seen that Potatoes are good for fattening, but bad for fleshening. Linseed cake contains a great deal of fattening matter, and but little nutritive matter; hence, Barley-meal, which contains a good deal of albumen, may be advantageously mixed with it. Dumas, a French chemist, states that the principle of fat exists in vegetables, as in Hay and Maize, and that, like albumen, it is deposited in the tissues unchanged. But Liebig regards fat as transformed Sugar, Starch, Gum, &c., which has undergone a change in the process of digestion. This is why Linseed cake is fattening: all the oil is squeezed out of the seed, but the seed-coat, which contains a great deal of Gum, and the Starch of the seed is left, and these are fattening principles. The oxygen introduced by respiration into the lungs is destined for the destruction of carbonaceous matter, but there is a provision made for taking it into the stomach with the food, and this is done by the saliva. The saliva is always full of bubbles, which are air-bubbles, which carry the oxygen of the atmosphere into the stomach with the food. The object of rumination in animals is the more perfect mixing of the food with the oxygen of the air. This is why chaff should not be cut so short for ruminating as for non-ruminating animals, as the shorter the chaff is the less it is ruminated, and the less oxygen it gets. Chaff is cut one inch for the ox, half-an-inch for the sheep, and a quarter for the horse. Some might, in consequence of this, suppose that cutting food is, then, of little use; but when it is considered that rumination is a strong exercise, or that an animal will not be eating more food that is ruminating, it will easily be seen how cutting facilitates fattening. In order that food may be properly ruminated, it requires a certain amount of consistency and bulk: hence all watery foods, as Turnips and Mangel Wurzel, should be mixed with straw. The opinion is very correct, that an animal "cannot chew its food without straw." An important inorganic constituent of the food is salt; it is a chloride of sodium. Whilst the chlorine goes to form the gastric juice, which is so important an agent in digestion, the soda goes to form the bile, which is a compound of soda. The bile is, in fact, a secondary combination, by which the carbonaceous matter is brought in contact with the oxygen, in order to be burnt. It is thus that common salt becomes so important and necessary an article of diet. In the series of changes by which the oxygen of the air is brought in contact with the carbonaceous matters in the body, iron plays an important part, and is hence one of the necessary ingredients of animal food. There are two oxides of iron, the peroxide and the protoxide; the first containing a large quantity of oxygen, the second a smaller quantity; the first, on being introduced into the blood, gives up a portion of its oxygen to the carbonaceous material of the bile, carbonic acid and protoxide of iron being formed; these two unite, forming a carbonate of the protoxide of iron, which, on being carried to the lungs, gives off its carbonic acid, and the protoxide of iron absorbing the oxygen brought into the lungs by respiration, forms again a peroxide, which again goes into the circulation, and, meeting with carbonaceous matters of the bile, unites with them and produces again and again the same series of changes. The small quantity, then, of inorganic ingredients in the food performs very important functions; and, in the absence of them, animals would die. In the next lecture (*which we shall fully report next week*), the various conditions of fattening Cattle will be more fully considered. The Duke of Richmond proposed a vote of thanks to Dr. Playfair for his very able lecture, which was seconded by Earl Spencer, and was warmly responded to by the meeting.

SMITHFIELD CATTLE SHOW.

WITH the magnificent exhibition of cattle which this Society has this week produced we have no concern; ample information respecting it will be gathered from the farming newspapers. We confine ourselves to the display of cultivated produce, which, although forming only a secondary feature in the exhibition, is by no means undeserving of notice. The largest collection of this kind was from Messrs. T. Gibbs, & Co., of Half-moon-street, Piccadilly; who exhibited some remarkably fine specimens of the Red Mangel Wurzel, upwards of two feet in length; of the Yellow Globe ditto, some of which were nearly a foot in diameter; samples of the Kohl Rabi, or Hungarian Turnip, which is found to resist the severest frosts of this country; an immense Red Norfolk Turnip, three feet seven inches in circumference, grown by Mr. Haynes of Hartland; some handsomely-formed Swedes, grown by his Grace the Duke of Bedford and various other persons; some specimens of the Red and White-topped Turnips; some White Belgian Carrots, grown by Mr. Kendell, one of which weighed 14 lbs., with a great variety of Corn in ear, Grasses, &c. Messrs. G. Gibbs & Co., of Down-street, exhibited some fine Red Mangel Wurzel, and Yellow Globe ditto, with Drumhead Cabbage, grown by S. Crawley, Esq.; some large specimens of the German White Carrot, grown by Benj. Currey, Esq., of Eltham Park; Ashcroft Swede and Red Globe Turnips; various pasture Grasses and samples of Wheat. From Mr. Chatwin of Hungerford Market, there was a large collection of Potatoes, including the Regent's and Early Manly, both handsome and round varieties; the Cambridge, Albany, and Bratton Kidney Potatoes, all well-formed and clean-looking kinds; and a nice clean-skinned sort, called the Large-leaved Kidney. From the Earl of Lovelace were some long Red and Yellow Globe Mangel Wurzel, not so large as many other samples exhibited, but particularly clean, and some good Carrots. Mr. C. Scott exhibited some fine specimens of Laing's Swedish Turnip, some seed of the Ash-leaved Kidney Potato, produced by removing all the tubers as they appear, and a sample of Watson's granulated compost, chiefly used for top-dressing Turnips. Mr. Skirving exhibited some of his Improved Swedish Turnip, grown upon land manured with guano; the specimens were large and heavy, and are longer and more angular than the common Swede. Samples of Hallard's early Spring Wheat and double-podded Beans were also shewn.

HORTICULTURAL SOCIETY.

Dec. 6.—His Grace the Duke of Devonshire, President, in the chair. Sir R. Howard, Bart., M.P., Messrs. W. Buckmaster and L. J. Makoy, were elected members. The exhibition, both of fruits and flowers, was exceedingly good, but, in consequence of the dulness of the day, the brilliant colours of the latter were not seen to advantage. Mr. Paxton, gr. to his grace the President, exhibited a magnificent plant of the beautiful Lælia anceps, with six long slender spikes drooping gracefully around, each bearing at its extremity a cluster of rich violet purple flowers; a species of Renanthera, with small dark chocolate-coloured blossoms, lately introduced by Mr. Cuming from the East Indies; and the singular little Trias racemosa, resembling a drooping feather, and exhaling an odour not unlike that of new hay: a Knightian medal was awarded for the Lælia. From Mr. Goode, gr. to Mrs. Lawrence, a remarkably fine plant of Epidendrum nutans, above 6ft. high, loaded with racemes of greenish white flowers; a variety of the same, having a slight tinge of yellow; Oncidium excavatum, and On. leucochilum, the former with bright yellow blossoms mottled with reddish brown spots—the latter having a green perianth spotted with dark brown, strongly contrasted with the pure white colour of the labellum; a handsome specimen of Zygopétalum Mackáii; Acácia platyptera, a new and rare variety, bearing some resemblance to A. decurrens; and a plant of the double Chinese Primrose: Mrs Lawrence also exhibited, towards the close of the meeting, a highly-interesting Convolvulaceous plant, with white flowers (growing three or four together from the axil of every leaf), which had been raised from seed received from Lord Auckland: a Banksian medal was awarded for Oncidium leucochilum. A large collection of cut Orchidaceous flowers were sent by Mr. Appleby, gr. to T. Brocklehurst, Esq.: amongst them were the rare and sweet-scented Maxillaria Steélii, with white wax-like flowers, curiously spotted with brown, and found in Trinidad, growing upon the stems of Palm-trees. Peristeria péndula, the Dove-flower of the Gardens, producing its singular cup-like blossoms in clusters. Lælia albida, pure white, and diffusing an agreeable fragrance; a fine dark variety of Zygopétalum Mackáii; several varieties of Gongora maculata; a handsome variety of Epidendrum macrochilum, and various others: a certificate was awarded for them. From Mr. Pawley, of Bromley, were four well-grown plants of Epiphyllum truncatum, each loaded with a mass of scarlet flowers: for these a Banksian medal was awarded. Mr. Carson, gr. to W. F. G. Farmer, Esq., exhibited a fine plant of Gesnera zebrina, for which a certificate was awarded. From J. Allnutt, Esq., was a pretty collection of cut Camellia flowers. From Mr. Tant, gr. to E. Johnstone, Esq., a box of cut Chrysanthemums, which were large and comprised some of the best varieties in cultivation. A Cuscuta and a species of Banistéria were also sent by some person unknown. Mr. Goodbrand, gr. to G. Crawshay, Esq., exhibited ten bunches of excellent Black Hamburgh Grapes (each bunch weighing about 1 lb. 3 oz.), cut from the same Vinery as those shown at the last meeting; the house still contains about 250 bunches in perfect condition, the whole having been grown without the application of fire-heat in the early part of the season, and not more than two bushels of coke having been used for keeping the house dry during the late dull weather: six handsome specimens of the Beurré Diel Pear, weighing 5¼ lbs., and two large heads of good solid Red Celery, weighing 6 lbs. each, were also shown by Mr. Goodbrand: a certificate was awarded for the Celery. From Mr. C. Judd, gr. to G. Knott, Esq., a large Providence Pine Apple, weighing 8 lbs., and an Antigua, weighing 4 lbs., both excellent specimens of their respective kinds: a Banksian medal was awarded for the Providence. A handsome fruit of the Enville Pine Apple, weighing 3lbs. 14oz., was sent by Mr. Fleming, gr. to the Duke of Sutherland. From — Hodges, Esq., were two enormous specimens of Uvedale's St. Germain Pear, each weighing 2 lbs. 8 oz.; a rather unusual weight even for this kind. From Mr. Spong, gr. to R. Gordon, Esq., some seedling Apples, called the Hermitage Pippin, and two Apples not named; the larger of which weighed 1 lb. 4oz., and was just beginning to decay: it afforded a good illustration of the statement made by Mr. Hassal at a late meeting of the Microscopical Society, that the decay of Apples was produced by the attack of a microscopical fungus, which, seizing on an injured part of an Apple or Pear, quickly spreads itself in all directions, until eventually the whole body of the fruit is reduced to a state of decomposition. Mr. Jas. Stewart, gr. to W. Baggs, Esq., sent a brace of Cucumbers, grown in pots in a Pine-pit, after the manner recommended by Mr. Ayres: although not so large as are generally exhibited, the specimens were well formed, and of a useful size for table. From the Garden of the Society were a handsome plant of Zygopétalum intermédium; Stanhópea saccata; the pretty little Oncidium ornithorhynchum, its slender panicles of red and yellow flowers hanging down in all directions; plants of the double white and red Chinese Primroses; Epiphyllum truncatum, and Helleborus orientalis, or the true Olympian Hellebore, a very rare plant, with beautiful green and white flowers; it is hardy, and has only lately been introduced from Mount Olympus. A collection of Chrysánthemums from the Garden, were also exhibited, amongst which were several excellent varieties, viz.—Duc de Canegliano, dark red; Phyllis, white, with a slight tinge of yellow; Conductor, yellow, with a touch of red in the centre; Beauty, blush; Eclipse, pure white; Goliath, white with a tinge of red; Pygmalion and Bijou, both handsome kinds lately introduced from France, having the form of a Ranunculus. The collection of fruit from the Garden consisted of Apples and Pears; those of the latter most deserving of notice were Bergamotte Cadet, which possesses the desirable property of its fruit continuing to ripen in succession for a long time from the same tree; the Chaumontel from standard trees, which, although not equal in size to those brought from Guernsey, at least rival them in flavour; and the Virgouleuse, with yellower flesh than perhaps any other Pear; this variety is chiefly used for grafting, as an intermediate stock between the Quince and other varieties of Pear which do not take well upon the former.

LINNEAN SOCIETY.

Dec. 6.—E. Forster, Esq., in the chair. Mr. L. Reeve exhibited a specimen of the animal of Panopœa aldrovanda, which had been taken from the sea, off Messina. The shell has been long known to naturalists, but only three or four specimens of the animal have ever been taken. From one extremity of the shell to the end of the proboscis it measured 2 feet; the proboscis measured about 8 inches. Mr. Ralph presented a specimen of the fruit of Jatropha multifida, exhibiting the peculiar character of the albumen and embryo. Mr. Quekett exhibited specimens of Ergot on Rye, which had been produced by watering the plants of Rye with water containing the sporules of Ergotetia diffused through it. Mr. A. Hassall read a paper on the development and reproduction of fresh-water Confervæ. The principal points of the paper were—1, that in their growth the Confervæ increased by the development of cells at their extremity; 2, that each cell continued, during the whole existence of the plant, to develop itself both longitudinally and laterally—and this is why the species of Confervæ cannot be characterised by the size or form of their cells; 3, that an increase of the cells takes place by the bursting of the membrane of the cell, and the folding in and union of the broken edges, forming a double septum.

FLORICULTURAL SOCIETY.

Dec. 6.—Mr. Wildman in the chair. A second annual report of the state and proceedings of the society was read. From this it appeared, that the number of members when the last report was made amounted to 117, while the present number was 133. The receipts during the past season amounted to 122*l*., of which 96*l*. had been awarded in prizes at the five exhibitions during the past year, exclusive of premiums to the amount of 17*l*. contributed by various persons. The number of flowers, particularly of seedlings, exhibited this season, showed a considerable increase upon that of the preceding year. In giving their opinions, the judges had been guided solely by the state in which the flowers had been submitted to their inspection. Although this might, on some occasions, have given disappointment, yet, in all probability, it would be found that those seedlings which had not maintained their character will prove inconstant, however good they may sometimes be. The following is a summary of the first and second class flowers which have been judged by them during the past season:—

	1st Class.		2d Class.	
	1841.	1842.	1841.	1842.
Auriculas . .	—	1	1	2
Tulip . . .	2	—	2	—
Heartsease . .	1	4	—	2
Pelargonium . .	—	—	—	3
Pink . . .	1	3	—	3
Carnation . .	1	1	2	1
Picotee . . .	1	2	3	4
Dahlia . . .	6	—	12	5

An advance has also been made in class-showing, which may be considered an advantage, as it offers a better mode of comparing the relative merits of various flowers than any other method. The report concluded by remarking that the committee had endeavoured, as far as possible, to keep the liabilities of the society within bounds, and as they were most anxious that the payments on account of prizes, or other expenses, should be made with punctuality, they trusted that they would be excused in pointing out that, however voluntary the subscriptions in the first instance might have been, it afterwards became imperative that they should be paid as soon after they became due as might be convenient to the parties, on account of distance or other circumstances.

MISCELLANEOUS.

Management of Cider.—In a late Number of the *Hereford Journal* is an article signed "W. Gardner," in which the writer states that, by means of cold water, cider may be brought to great perfection. As an experiment for testing the ability of this simple element in fining cider, he advises every one interested in the matter to securely place a small cask, or even a small wooden bottle of cider, fresh from the mill, in a tub of cold water. In spite of atmospherical changes, which increase the acetous fermentation in new cider, it will be found that that beverage, thus treated, will in the course of a few days free itself from impurities; it should then be racked, the grounds bagged, and the clear liquor placed where it is intended to remain, until it is old enough "to warm the heart of any honest Briton."

Artificial Yeast.—If common Wheat flour be mixed with water to a thick paste, and exposed, slightly covered, to spontaneous change in a moderately warm place, it will undergo a series of alterations. On the third day it will exhale an exceedingly disagreeable sour odour, like that of stale milk; about the sixth or seventh day this smell will disappear, and will be succeeded by a distinct and somewhat agreeable vinous odour: the substance is then in a fit state to excite alcoholic fermentation. By adding to it a quantity of brewers' wort, cooled down to 90° or 100°, and placing the vessel in which it is contained in a warm situation, an active fermentation will be excited; and when the action is complete and the liquor clear, a large quantity of excellent yeast will be found at the bottom, well adapted to all purposes for which that substance is applied. In one experiment, the following materials were used:—a small handful of ordinary Wheat flour was made into a thick paste with cold water, covered with paper, and left seven days on the mantel-shelf of a room where a fire was kept all day, being occasionally stirred; at the end of that period three quarts of malt were mashed with two gallons of water, the infusion boiled with some Hops, and when sufficiently cooled, the ferment added. The results of the experiment were a quantity of beer (not very strong, it is true, but quite free from any unpleasant taste), and at least a pint of thick barm, which proved perfectly good for making bread. It appears to me that this simple plan would enable distant residents in the country, and settlers in the colonies, to enjoy the luxury of good bread where a little malt could be got—a very easy home-manufacture from grain of any kind: the Hops might probably be omitted when yeast alone was the object.—*Fownes, in the Pharmaceutical Journal.*

M. Kotschy.—We mention with much regret, on the authority of letters from Vienna, the death of this indefatigable travelling naturalist, somewhere in the East. No particulars are given, but the fact is certain.

Horticultural Society of London.—Advices have been received from Mr. Hartweg, dated Quito, July 17, where that indefatigable collector had been staying for some months. A large number of fine things had rewarded his researches, and are on their way to England. On the western side of Pichincha he had found the long-wished-for Fuchsia triphylla, with two other new species; a Cestrum with a dark blue corolla, measuring three inches in length; a fragrant pretty Monnina, and the Cratægus stipularis of Kunth. In San Antonio, a village under the Line, he had procured bulbs of what he supposes to be Phycella chloracea. Eight days before the departure of his letter, Mr. Hartweg had returned from an excursion to Nanegal, on the western declivity of the Andes of Quito; the journey had been a severe one, for during five days he had to proceed on foot through mud and rivers; he was, however, rewarded by many good discoveries. Among other things he found an Oak, the first met with in those latitudes; the Acorns were not however ripe, nor was it at all probable that the species would be hardy in Europe. A considerable quantity of seeds, bulbs, and Orchidaceous plants, are on their way. We trust they will arrive in good condition.

GARDEN MEMORANDA.

Chandler's Nursery, Vauxhall.—Many of the Chrysanthemums are not blooming so well as is usually the case at this nursery; probably in consequence of the long-continued dry weather durng the summer months. Several kinds are, however, flowering in perfection; amongst which we particularly admired the following kinds:—Minerva, a quilled white flower, with a yellow centre, the exterior petals gradually changing to pink; Champion, lemon, with deep yellow centre, well filled up: this is a large flower, and generally a shy bloomer, but this season it is flowering more freely than many other kinds; Princess Marie, light blush, changing to purple; Compactum, white, small, but an abundant bloomer; Conductor, dark yellow, also a small flower, but well filled up; Duc de Canegliano, dark red, with singularly twisted petals; Theresa, orange and red, a large showy flower; Victory, pure white; Vesta, also a good white, the petals when first expanded being slightly cupped; Madame Pompadour, a handsome light-purple variety; Mirabile, white and buff, a free bloomer, and very compact; Chancellor, a fine bold flower, yellowish white and pink; Ivanhoe, reddish brown, slightly tipped with yellow; and Demosthenes, dark yellow, with reddish-brown centre, well filled up. Many of the new French varieties introduced this spring by Mr. Chandler have not flowered; but several of those which have bloomed appear to be a great improvement upon the old sorts. One, named Phidias, is a beautifully-formed carmine flower, with a slight tinge of yellow; rather small, but corresponding in that respect with its dwarf habit. Bijou is also a delicate and very desirable variety, being white, with each petal, at its first expansion, tipped with bright purple; having more the appearance of a good Ranunculus than of a Chrysanthemum. Campestroni is a valuable addition, being purple, and producing large flowers, with petals a little incurved; it is certainly the best of that colour. Julius Cæsar is a large round reddish brown flower, with flat petals. The Camellias are of a dark healthy green, and promise an abundant bloom; in two or three months' time they will no doubt make a fine display.—*R. A., Dec.* 5.

Reviews.

The eighth volume of *The Transactions of the Agricultural and Horticultural Society of India* has reached us. It contains a large quantity of matter very useful to persons interested in tropical agriculture. The cultivation of Hemp, Cotton, Tea, Flax, Sugar, and Potatoes forms the principal subject of the volume before us. We shall make extracts from the more interesting papers as opportunities occur, and we can find room for them.

The Quarterly Journal of Agriculture.—No. 59 is not quite so good as usual. It, however, contains some valuable matter furnished by the Highland Society; among which a paper on the growth of wool, another on feeding and sheltering sheep, one on pruning and thinning timber, and the continuation of the Agriculturist's note-book, deserve to be particularly noticed. We have no room for extracts just now, but we see that we must soon avail ourselves of the contents of some of these papers.

The Government Currency Pamphlets.—No. 1 is the beginning of a series of attempts to show that the real cause of the distress of the country is its "inadequate, precarious, and unsound monetary system." The author proposes as a remedy, a government, or sound national currency, based on the property of the country; and he is convinced that, if his plan is adopted, taxes to the amount of 5,000,000*l*. may be repealed, and the National Debt of upwards of 800,000,000*l*. gradually and honestly liquidated. These are matters relating to politics from which we studiously abstain.

Stephens' Book of the Farm. No. 9 (Blackwood).—Here is another of these excellent practical books. It relates to the driving and slaughtering sheep, the rearing and feeding cattle on Turnips, the treatment of farm-horses, and similar subjects, treated in the usual detailed and skilful manner of this author.

CALENDAR OF OPERATIONS *for the ensuing week.*

A very important part of a gardener's business is to supply the kitchen well, which he cannot do unless he can command good seeds of good vegetables; and we are sorry to be under the necessity of adding that, owing to the carelessness of commercial growers, this is a difficult matter. There are few gardeners who do not suffer more or less every season by receiving seeds which are not true to their names; and as the error is not discovered till too late to remedy it, constant bickerings arise in consequence, between the gardener and that all-potent individual—the cook, which usually end in the discharge of the former, whose failures, from whatever cause they may arise, are too generally ascribed to incompetence. Retail seedsmen, by whom gardeners are supplied, do not often grow the seeds they sell, therefore they are not wholly to blame; but it is surely not too much to expect that in a matter of so much importance to their customers, a proper degree of caution should be exercised in the selection of their stock from those growers only who can be confidently depended upon. Admitting that from the facility with which many cultivated vegetables hybridise, and from other causes, it is not possible to insure correctness in every case; still we maintain, that with common care the annoying blunders, which are now so frequent, might in a great measure be prevented; and unless this is attempted, gardeners in self-defence will be driven to adopt the plan suggested in a late Number by "W. W."

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Tree-leaves can now be obtained in great plenty for filling up any pits that may have been kept empty up to this time; this, however, ought not to be done when the leaves are very wet, because they then heat more strongly and decay sooner than when they are tolerably dry and firmly trod down. A pit, prepared in this manner now, will be ready in a few weeks to receive the plants that are wanted to show fruit early next spring; these should therefore be kept drier and cooler (50° to 55°) up to that time, and the temporary check will give them an inclination to throw up flower-stems upon an increase of temperature. Renew the linings to pits (not, however, on all sides at one time) if the late heavy rains have chilled them.

Vinery.—If a house was shut up as directed last week, the temperature ought now to be raised a few degrees, which, if the weather is mild, might be done by giving less air, without the aid of fire-heat, provided dung or bark has been introduced. A night temperature of about 55° is sufficient at present. Maintain a humid atmosphere, especially if fire-heat is applied, and syringe the Vines two or three times a day with milk-warm water. Strong last year's shoots must not be tied up to the wires, but should have their points curved downwards; old stems which have been forced before might, however, be placed in their proper position at once, as there is no fear of their breaking well, if sufficient time is allowed. The outside border should be mulched now, if not still too wet.

Peach-house.—During this week the temperature need not exceed 45° at night, which, if mild weather continues, might be obtained without fires. Let the trees have gentle dewings (once or twice a day, according to the state of the weather) with water that has had the chill taken off, and admit fresh air freely. Success depends essentially upon the organs of fructification being allowed time to unfold themselves gradually.

Cucumbers.—Bearing-plants in pots and boxes should be fed once or twice a week with manure-water; but take care that it is not too strong, or cooler than the air of the house. If seedling plants have already been raised on a dung-bed, they must be carefully guarded against damp and rank steam from the hot dung. A layer of sand over the surface will check the ascent of vapour through the light material with which seed-beds are usually covered.

Asparagus.—Raise slight linings round the beds if cold weather should make additional heat necessary. Give air in the day, and when mild draw the sashes quite off the frames.

Radishes.—Make up a bed of dung and leaves, chiefly the latter, for these. In case no Carrots were sown in autumn, some seed may be put in now, in alternate drills, with the Radishes.

Kidney Beans.—Sow another crop.

Cauliflowers, Lettuces, and all vegetables under glass for preservation through the winter, ought to be made as hardy as possible by constant exposure, except during rainy or frosty weather. Keep them clear of dead leaves, and guard against slugs.

Out-door Department.

On frosty mornings wheel ont manure, and if the ground is not too wet it had better be dug before severe weather sets in. Take advantage of dry days to clear off weeds, which the late mild and moist weather has caused to grow rapidly. Also lose no favourable opportunity for tying up Endive, earthing Celery, and defending other crops, as far as practicable, against severe frost, which is likely to be more than commonly injurious to plants after this mild season. Tall plants of Broccoli which have not been removed, might be laid down where they grow; although late in the season for this operation, the plants will be more secure against frost and snow then when standing upright. When the Beans and Peas which were sown last month appear above ground, they should be covered with rotten leaves, bark, or sand, to protect them from cold and vermin.

Orchard.—Persevere in pruning and nailing wall-trees while the weather is open, as it would be desirable to get the principal part of this work completed before spring; at which period so many operations, which will not admit of delay, demand attention. Pruning and nailing, however, ought not to be attempted when it cannot be done with facility; to make men stand at walls in bitter cold weather, is not only a waste of time, but a positive act of cruelty.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Take great care of the young shoots of Orchidaceous plants which are beginning to grow, as they are very apt to suffer from the water collecting at the base of the young leaves. Syringe freely such things as Aérides, which are suspended upon blocks of wood or in baskets; there is not much danger of them suffering from too much moisture. Keep the house and plants, generally, rather dry, as was formerly recommended.

Greenhouse and Conservatory.—Although this and the succeeding are two of the dullest months in the year in this department, the greenhouse may still be tolerably gay with late-blooming Heaths, Chrysanthemums, Chinese Primroses, forwarded Camellias, &c., which will be succeeded, as they decline, by forced flowers. The dull, damp weather must not prevent a liberal admission of air to the houses; free exposure now of those plants that are not wanted to grow will harden them to bear more cold and confinement during the severity of the winter.

Pits and Frames.—The forcing pit must be attended to in introducing plants in due succession. Where there is not a convenience of this kind, some plants might be forwarded in any of the fruit-forcing houses that are at work. Wall-flowers, Alyssums, and other herbaceous plants for forcing in spring, should only be covered when it freezes or rains.

Out-door Department.

Proceed with planting and pruning hardy shrubs and trees. After pruning, beds of Roses should have some good manure lightly pointed in among them. In poor ground, pillar Roses will likewise require assistance at the root, as the free-flowering of many sorts depends upon a moderately vigorous growth. Mulch beds of Fuchsias, &c., which are not intended to be taken up.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Young trees intended for planting ont, may be taken up and laid in by the heels, so that the ground they occupied might be prepared by trenching and manuring, for replanting from the seed-beds in spring.

Forest and Coppice Woods.—When the weather is suitable, proceed with planting so long as that operation remains to be done.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Dec. 8, 1842, as observed at the Horticultural Garden, Chiswick.

Dec.		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	2	30.079	30.028	55	32	43.5	S.

The highest temperature during the above period occurred on the 17th, in 1832—thermometer 57°; and the lowest on the 14th, in 1840—thermometer 18°.

REPORT ON COVENT GARDEN MARKET,

For the Week ending Dec. 9, 1842.

[The Half-sieve contains . . .	3½ imperial gallons.
The Sieve	7 " "
The Bushel Sieve	10½ " "
The Bushel Basket	1 imperial bushel.
Punnets for Seakale are . . .	7¾ in. wide and 2 in. deep.
" Radishes	8 " 2 "
" Mushrooms	7 " 2 "
" Salad	5 " 2 "]

Little variation has taken place during the past week; the supplies have been equally as good as in the preceding one, and trade is not quite so dull. *Fruit:* Of Pines there is a good supply, chiefly of the sorts named in our last report, from 3*s*. to 5*s*. per lb. Hothouse Grapes have advanced a little in price, and fetch from 2*s*. to 3*s*. 6*d*. per lb. The principal Dessert Pears are the Nelis d'Hiver, of excellent quality, at 7*s*. per half-sieve; the Glout Morceau, at 5*s*.; and the Chaumontel, from 2*s*. to 4*s* per half-sieve. The Dessert Apples are numerous, and consist of the Newtown Pippin, at 2*s*. per dozen; Golden Harvey, at 3*s*. per half-sieve; Golden Pippin, at 4*s*. per half-sieve; Ribston Pippin, from 4*s*. 6*d*. to 6*s*. 6*d*. per bushel, and various others. Quinces are no longer to be obtained. Medlars are less plentiful, and are selling at 6*d*. per dozen. We observed some excellent Cucumbers, for this season of the year, from 1*s*. to 1*s*. 6*d*. each. *Vegetables:* Asparagus and Seakale have both improved greatly in quality, and the quantity offered is considerably increased; the best bundles of the former fetch from 8*s*. to 10*s*. each, while the smaller ones may be obtained from 3*s*. to 5*s*. Seakale is selling from 1*s*. 6*d*. to 2*s*. 6*d*. per punnet. A small quantity of good forced Rhubarb has appeared, which is offered at 1*s*. 6*d*. per bundle. New Autumn Potatoes are somewhat cheaper, and fetch from 6*d*. to 9*d*. per lb. The quality of Broccoli, Brussels Sprouts, and other greens is good; their price has scarcely varied for several weeks. Pickling Onions are tolerably abundant, and are selling from 3*s*. to 4*s*. per half-sieve; large Onions are this season much dearer than usual, being sold from 4*s*. 6*d*. to 6*s*. per bushel. Mushrooms are plentiful, from 8*d*. to 1*s*. per pottle. *Flowers:* Those in pots consist chiefly of Chrysánthemums, Ericas, and Tulips: amongst the forced cut flowers we observed White Indian Azáleas, Narcissuses Tulips, Cýclamens, Anemones, Verbenas, Fairy Roses, Pelargóniums, and Violets.

PRICES, Saturday, Dec. 10, 1842.—FRUITS:—

Pine Apple, per lb. 3*s* to 5*s*
Grapes, Hothouse, per lb. 2*s* to 3*s* 6*d*
— Spanish, 9*d* to 1*s*
— Portugal, 1*s* to 1*s* 6*d*
Cucumbers, per brace, 2*s* to 3*s*
Apples, dessert, per bush., 2*s* 6*d* to 6*s* 6*d*
— Kitchen, 2*s* to 5*s*
— American Newtown Pippins, per hf.-sieve, 5*s* to 6*s*
Pears, dessert, per hf. sieve, 2*s* to 8*s*
Pomegranates, per doz., 3*s*
Medlars, per doz. 6*d*
Oranges, per doz., 9*d* to 2*s*
— per 100, 4*s* to 12*s*
Oranges, bitter, per 100, 8*s* to 14*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Almonds, per peck, 6*s* to 7*s*
Sweet Almonds, per pound, 3*s*
Chesnuts, per peck, 2*s* 6*d* to 6*s*
Walnuts, per bush., dried, 12*s* to 16*s*
Filberts, English, per 100 lbs. 60*s* to 70*s*
Cob Nuts, per 100lbs., 80*s* to 90*s*
Nuts, per bushel—
— Brazil, 16*s* to 20*s*
— Spanish, 18*s* to 20*s*
— Barcelona, 24*s*

VEGETABLES.

Savoys, per doz. 6*d* to 1*s*
Cabbage, per doz. 9*d* to 1*s* 6*d*
— plants, per doz. 1*s* 6*d* to 2*s* 6*d*
— Red, for pickling, 1*s* 6*d* to 5*s*
Brussels Sprouts, per hf.-sv. 1*s* 3*d* to 2*s*
Broccoli, White, per bunch, 9*d* to 1*s* 6*d*
— Purple, 8*d* to 1*s*
Cauliflowers, per doz., 1*s* to 4*s*
Potatoes, per ton, 40*s* to 70*s*
— per cwt. 2*s* to 3*s* 6*d*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bu., 1*s* 6*d* to 2*s* 6*d*
— Scotch, per bu., 1*s* 3*d* to 1*s* 6*d*
— New, per lb., 6*d* to 9*d*
Jerusalem Artichokes, per half-sieve, 9*d* to 1*s* 6*d*
Turnips, per doz. bun., 1*s* to 2*s* 6*d*
Red Beet, per dozen, 9*d* to 1*s*
Scorzonera, per bundle, 1*s* 3*d* to 1*s* 6*d*
Salsafy, per bundle, 1*s* 3*d* to 1*s* 6*d*
Horse Radish, per bundle, 1*s* 6*d* to 4*s* 6*d*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 1*s* to 1*s* 6*d*
Carrots, per doz. bun., 3*s* to 5*s*
Parsneps, per dozen, 6*d* to 1*s*
Spinach, per sieve, 1*s* to 1*s* 6*d*
Leeks, per doz. bun., 1*s* 6*d* to 2*s*
Onions, per bushel, 4*s* to 6*s*
— Pickling, per hf.-sv., 3*s* to 4*s*
— Green, p. doz. bun 3*s* to 3*s* 6*d*
— Spanish, per doz. 2*s* to 5*s*
Garlic, per lb. 6*d* to 8*d*
Shallots, per lb., 1*s*
Asparagus, per 100, 8*s* to 10*s*
— Second or Middling, 3*s* to 5*s*
Sea-kale, per punnet, 1*s* 6*d* to 2*s* 6*d*
Lettuce, Cabbage, p. sc., 6*d* to 9*d*
— Cos, 9*d* to 1*s*
Endive, per score, 1*s* to 1*s* 6*d*
Celery, p. bd., (12 to 15) 6*d* to 1*s* 6*d*
Rhubarb Stalks, per bundle, 1*s* 6*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Parsley, per doz. bunches, 1*s* 6*d* to 2*s*
Tarragon, per doz. bun., 2*s* to 3*s*
Sage, per doz. bunches, 1*s* 6*d* to 2*s*
Mint, per doz. bunches, 2*s*
Chilies, ripe, per 100, 1*s* 6*d* to 2*s*
Mushrooms, per pottle, 8*d* to 1*s*

Notices to Correspondents.

We shall be obliged if our Correspondents, in their future communications, will take care that no general question relating to *different* subjects is asked in the same paragraph, and that each question is headed with the principal subject. *One side only of the paper should be written on*, so that we may separate each question. If these directions are observed, it will greatly facilitate our obtaining answers, and will enable us to arrange our Correspondence under general heads, separating those questions and answers which are of interest merely to individuals, from such as are of general interest.

Manures.—*G. C.*—Sawdust mixed with gas-water will not do for American plants, unless the fermentation has reduced the sawdust to the state of fine mould. Even then they will not grow in it alone; but perhaps they might if mixed with one-third of cow-dung. In no case, nor for anything, is it suited until it is thoroughly rotted. The best way of using it is by mixing it with cloacine (nightsoil—forgive us for this new word), and letting it lie till it decays, which it will soon do. As Beech sawdust contains phosphates in large quantity, it is not improbable that the sawdust of that timber, reduced with gas-water, may alone suit American plants; but of that we have no experience.† ——*A Subscriber.*—Urine should be in fermentation before being used; the state of liquid manure is immaterial.†——*K. S.*—Your plan for improving your liquid manure is more troublesome than useful. Putrid fermentation, which is what you want, will take place fast enough without artificial aid. No manures are better than those naturally formed, if they are not wasted or spoiled by negligence. If you have any yeast to spare, and will allow it to become putrid, it will form the strongest manure yet known.†

Spirits of Tar.—*A. B. C.*—Mr. M'Intosh, in his original paper, recommends this substance to be applied to the land upon which Carrots are to be sown at the time when it is dug or trenched. A letter from another correspondent is now before us, in which it is stated that spirits of tar have been used with perfect success at the time of sowing the seed. We are ourselves inclined to believe that it will prove more effectual if applied at the latter season. ‡

Heating.—*H. G. B.*—We would certainly recommend you to heat your pinery and stove by hot water, in preference to smoke flues. The former is not only more economical in the end, but it preserves a greater regularity of temperature, and retains its heat much longer than a common flue; it is also less liable to dry up the moisture which is floating in the atmosphere. The latter point, moreover, can always be remedied, by fixing evaporating-pans upon the hot-water pipes whenever a greater amount of moisture is required. That they produce mould may be true; but it is only the case when a stagnation of air takes place in consequence of insufficient ventilation. ‡ ——*G. S.*—The most economical mode of heating a grapery, 36 feet long by 14 feet wide, and at the same time best adapted for the perfection of the fruit, is by the simplest kind of hot-water apparatus; with closed iron pipes.†

Tan.—*J. C. Y.*—Tan is preferable to dung for placing in the interior of pits for the growth of Melons, on account of its being a better and more steady retainer of heat, and also from its being less liable to settle to such a degree. Where dung linings can be applied to the exterior of pits, the tan within them may be kept during the season at any desired temperature. ‡

Rust on Grapes.—*To a Subscriber.*—We are requested by *Agronome* to beg of you, in addition to the statement you have already made respecting the improbability of rust on Grapes being occasioned by the causes usually assigned, to favour us with your opinion as to what really *does* occasion that disease. ‡

Vines.—*W. C. D.* complains that he cannot ripen the Grape called Eschcolata superba. He says, that in a Vinery, planted two years ago with Muscats, Black Hamburgh, and an Eschcolata, all have ripened well except the latter; and that he has previously seen good Grape-growers experience the same difficulty. The best thing he can do is, we think, to replace his Eschcolata with something better. We do not know the history of this Grape, but we remember seeing it in the hands of the late Mr. Money in what *he* called a ripe state, but what *we* called a verjus state. It was puffed off a good deal at one time, but seems to have sunk into oblivion. If any one can give a good account of it, perhaps he will do so. †

Ferns.—*G. W. S.*—The network you mention is evidently the woody system of Aspidium Filix-mas in its rudimentary condition. Your observations are curious, and if you will favour us with your detailed remarks respecting this structure we will publish them; or you can find a place for the paper in some of the Botanical Journals of the day. We do not find the structure noticed in any book now at hand. It has apparently been missed by Adolphe Brongniart, although he has occupied himself specially with these subjects. †

Wistaria Backhousiana.—*A Lady.*—The plant sold under this name is not a Wistaria, nor is it known what it is. It has never flowered, and does not promise very well. It received its name from some dealer, in order to sell it by. You should always be very shy of buying things with names not known in books.†

Rhododendron Barbatum.—*A Lady.*—The flowers of this plant are unknown in Europe: they are reported to be dark red, and about as large as those of a small R. ponticum †

Mahónia aquifólium.—*W. C.*—This is a hardy shrub, and will no doubt grow under Fir-trees, although it will not flower so freely in such a situation as if it were more exposed. In this country it seldom attains a greater height than five feet. ‡

Cedar-wood.—*Presbyter Parochialis.*—The remarks concerning the Cedar of Lebanon, to the effect that it is unlikely it was used in the erection of the Temple of Solomon, occur at p. 765 of last year's *Chronicle.* The wood which is supposed to have been used in that building is that of the Callitris quadrivalvis, which is hard, durable, and fragrant, and commonly used in religious buildings in the East. ‡

Coniferous Plants.—*P. W. J.*—For Rochester we should advise you to procure the Deodar, the Douglas Fir, and the two Pines called taurica and halepensis; or, instead of the latter, Pinus Brutia, if you can obtain it. They are all very handsome.†

Clianthus puniceus.—*Anne,* who has a fine specimen of this plant growing on a terrace close to a flint wall, on a south-east aspect, in the Isle of Wight, which has never yet bloomed, but is now promising a profusion of blossoms, had better place the glass sashes of a Cucumber-frame before it, or the frost will destroy her hopes; and in very severe weather it will be even necessary to throw mats over the sashes. It must, however, have as much light as possible. †

Chinese Primroses.—*J. L. C.*—These plants should be potted in well-drained pots, in a mixture of ½ turfy loam, ¼ sandy peat, and ¼ vegetable mould. They should be placed in the most airy part of the greenhouse, and should be watered sparingly, otherwise they are very apt to damp off during winter.‡

Violets.—*J. L. C.*—For blooming in winter, Neapolitan and other double Violets should be taken up in the early part of September, and either potted or planted out in a frame in light rich soil. The situation in which they are placed should be freely exposed to the sun, and all that they will require will be to give them plenty of air at favourable periods, to preserve them from frost, to water them sparingly, to keep off slugs, and to pick off all decaying leaves as they appear.‡

Cacti.—*C.*—You may reduce your plant of Cactus Jenkinsoni, which has grown too large, by cutting out some of the older and least ornamental branches. To make it bloom freely, water should be entirely withheld from the present time until March or April, when the blossom buds will begin to appear. This treatment will also check its exuberant growth.‡

Chrysanthemums.—*J. L. S.*—The reason why these plants usually present such a miserable appearance from the loss of leaves on the lower part of their stems is, that they have either been stinted for pot-room, or have been stopped too early in the season, or have not been attended to in watering when necessary. During their growing season, they should be frequently shifted into larger pots, and copiously watered with liquid manure. ‡

Succulents.—*J. L. S.*—You cannot procure any succulents more showy and better adapted for cultivating in a small greenhouse or pit, than Céreus speciosíssimus, C. speciosus, C. Ackermanni, C. Jenkinsoni, and C. flagelliformis. ‡

Euphórbia splendens.—*Ignoramus.*—This plant does not lose its leaves in winter. ‡

Musa Cavendishii.—*C. J. B.*—When this plant has been grown in the beds or borders of the stove, it attains a much greater size than when it is planted in tubs. The specimen which you describe as 10 feet high is by no means remarkable. There are many equal to it at Chatsworth. It is always inclined to grow larger than usual when put in rich soil, or a high temperature. There has been one bunch of fruit gathered at Chatsworth this autumn weighing 73 lbs.

Bulbs.—*J. L. S.*—The following are handsome bulbous plants, suitable for growing in pots in a Greenhouse, from which Tulips, Hyacinths, &c., are excluded: Oxalis Bowei and versícolor, Lachenália trícolor, Sparaxis trícolor and grandiflora; Tritónia pállida, crispa, and squálida; I'xia patens, viridiflora, aristata, and crocata; Watsónia fúlgida, and Hypoxis élegans.‡

Filberts.—*Ignoramus.*—The article on the cultivation of the Filbert, referred to at p. 793, is briefly this: the plants should be trained with a single stem one foot high, and should then be permitted to branch into a symmetrical head, rather open in the middle, and not higher than a man can conveniently reach from the ground to perform the necessary operations of pruning and gathering. The proper time for pruning is the spring, when the male blossoms are open, as the shaking of the trees by the act of pruning assists in the diffusion of the pollen. The young shoots should be shortened to about half their length, and it is best to cut to a bud that shows a female blossom. All suckers should be carefully removed. By way of manuring, some persons throw off the surface soil two or three feet wide round the stem of the tree, and into this basin the small prunings, leaves, &c. are put and dug in.

Quince.—*J. D.*—The Quince may be propagated by cuttings with as much success as by layers; but the plants raised by the latter method become fit for grafting in less time than the former. The French raise their Quince stocks principally from cuttings. ‡

Strawberries.—*S. R. S.*—It is not beneficial to remove the leaves of Strawberry plants, except for the sake of neatness. Where that is not a material object, they had better be allowed to remain. ‡

Pears.—*Pomona* says she has a moor-fowl egg Pear-tree, whose fruit, which has always been remarkably good, has suddenly become woolly and flavourless. Last year the tree bore a large crop of deliciously-juicy fruit, but as the tree was getting rather larger than she wished, she had it root-pruned. The trees by the side of the Pear have borne good fruit, as usual. Probably, in this case, the fruit has become woolly in consequence of acquiring its size later in the season than would have been the case had it not been checked in spring by the operation of root-pruning. You would have better let well alone, as the produce was previously abundant and rich; and kept the tree within the desired limits by summer—instead of root-pruning. We should rather ascribe the evil to the root-pruning having rendered the tree incapable of absorbing fluid enough from the soil, the effect of which has been that the sap became too concentrated, and thus the whole quality of the fruit was changed. †

Gum on Fruit-trees.—*T. M.* states that he has Nectarine and Apricot trees, from which gum exudes copiously all round the stems just above the ground; and wishes to know the cause, and a remedy for it. [When the growth of trees is for a considerable time checked by drought, and when this is succeeded by plentiful rains, occasioning a greater flow of sap than the vessels have been accustomed to receive, gum is then apt to exude, more especially if the border contains abundance of rich manure. Too much manure, independent of other circumstances, will also occasion gum; and so will the improper cutting out of large branches. The rays of the sun frequently act with destructive energy on the exposed portions of the stems; and on examination you will probably find yours are sunburnt. There is no local remedy. You must promote the flow of sap, when it is deficient, by mulching and watering, and withhold manure from the border if the latter is already too rich. Wash the gum clean off when it is softened with rain, and screen the stem from the direct rays of the sun in summer. ‖]

Walnut-Trees.—*Totty.*—"Discipulus" informs us that half-a-dozen years ago he removed four Walnut trees of the size you mention, which have succeeded very well; they were by no means skilfully removed.

Wall-trees.—*A. B.*—For your south wall you had better plant Royal George, Bellegarde, Malta, and late Admirable Peaches the Elruge and Violette Hâtive Nectarine; and the Moorpark and Royal Apricots. For the north aspect: the Jargonelle, Hacon's Incomparable, and Bezi d'Héri Pears; the Orleans Plum; Kentish and 2 Morello Cherries. For the east aspect, 2 May Duke Cherries and a Green Gage Plum. For the west aspect, the Passe Colmar, Glout Morceau, and Beurré Rance Pears.‖——*A Subscriber.*—The following varieties of Apples, Pears, Plums, and Cherries, are considered proper for the walls of your garden, in the West Riding of Yorkshire.—For the south aspect, 55 yards in length: Marie Louise, Hacon's Incomparable, Winter Nelis, Glout Morceau, Passe Colmar, and Beurré Rance, Pears; May Duke and Elton Cherries; the Green Gage, Purple Gage, and Coe's Golden Drop, Plums. For the north aspect: 2 Kentish, 2 Morello, Cherries; 2 Orleans and a Washington Plum; Jargonelle, Hacon's Incomparable, Catillac, and Bezi d'Heri, Pears. For the east aspect: Hacon's Incomparable, Thompson's, Ne plus Meuris, Suffolk Thorn, Knight's Monarch, Louise Bonne of Jersey, and Easter Beurré, Pears. For the west aspect: Ribston Pippin, Court of Wick, Nonpareil, and Golden Harvey, Apples; the Royal Hâtive, Green Gage, and Ickworth Impératrice, Plums. For the east and west aspect of your dwarf wall, the Dunmore, Winter Crassane, Marie Louise, Beurré Bosc, Thompson's, and Winter Nelis, Pears, may be planted on either side, and trained downwards on the opposite; the Syke-house Russet, Pearson's Plate, Herefordshire Pearmain, Boston Russet, Scarlet Nonpareil, Ribston Pippin, Court-pendu Plat, and Reinette du Canada, Apples, will fill up the remaining portion of your space. ‖

Cucumbers.—*A Subscriber.*—We believe there is no better mode of keeping Cucumbers fresh, after they are cut, than that of placing them amongst damp moss in a cool situation. ‡

Asparagus.—*A. B. C.*—The soil and dung which are usually applied to Asparagus-beds during autumn, are not put on to preserve the roots from frost, but for the purpose of enriching the beds. Your plan of removing the leaves from the surface of your beds in spring, for the purpose of giving the latter a good salting, is a good one. ‡

Beet.—*M. N.*—Bassano Beet will no doubt be on sale this year among the principal London Seedsmen.†

Books.—*Inquirens* will find the information he wants in "Sweet's Catalogue."†——*R.*—A most useful book for learning the genera of British plants is "Baxter's British Flowering Plants," with figures of all the genera.†——*T. J.*—We very much recommend you to procure "Martin Doyle's Encyclopædia of Practical Agriculture;" as you do not want to know much about farming, but to understand your little well.†——*A Well-wisher.*—One of the best works on landscape gardening and ornamental scenery is that entitled "Sir Uvedale Price on the Picturesque," of which some account is given at p. 320 of this year's *Chronicle.* ‡——*A Journeyman.*—Considering what books you have, you would find it advantageous to provide yourself with a good double pocket lens, Lindley's Theory of Horticulture and Natural System of Botany, Hooker's British Flora (last edition), Paxton's Botanical Dictionary, and Sir Uvedale Price on the Picturesque; all which will be bought for less than the money at your disposal.†——*G. S.*—The information you wish for will be found in Johnson's Farmers' Encyclopædia, or Stephens's Book of the Farm, when completed. We will answer your inquiry about the culture of Vines under glass when we have examined Mr. Roberts's book. †——*M. N.*—The title of Sprengel's book is "Die Lehre von Dünger." 8vo.†

Worm-casts.—*Anon.*—These are not at all injurious to land; on the contrary, they are beneficial, by keeping the soil more open. But they are unsightly, and therefore objected to on lawns. We should not think of removing them where appearance is no object. †

Moss on Lawns.—*W. C.*—This is produced by the growth of a small plant, and chiefly occurs where the surface is very damp and ill drained. Watering with gas-water mixed with five or six times its volume of water will destroy it. †

Law.—*J. W.*—We dare not give you a legal opinion upon the termination of your tenancy; we have too much personal experience of the uncertainty of such matters. You must consult your solicitor. In general, we are most anxious to avoid all replies to legal questions. †

Crops.—*H. H.*—If you must give up at *Midsummer next* a small slip of ground, very light soil, usually appropriated to Potatoes, why not crop it with an early set of Ash-leaved Kidneys?†

Patent Asphalts.—*J. B.*—The smell of tar, which you perceive in pits that have been protected with patent asphalte shutters, will do your plants no harm. ‡

Microscopes.—*R. Scot.*—Your previous letter has not been received. In order to examine the internal parts of plants with the microscope, you must cut them into slices, not more than the 50th of an inch thick; if you can make them thinner, so much the better.†

Exhibitions.—*Cryptogamia.*—A collection of Bengals, Boursaults, and Noisettes can compete in the class for Pot Roses.‡ The Pelargoniums to be exhibited in Class A. may be seedlings; varieties coming out, or those recently sent out, provided they are flowers of the first class. The object in establishing this class is to improve the *quality* of the Pelargoniums sent for exhibition. Complaints have constantly been made regarding the inferiority of the sorts exhibited, compared to the best raised; and as inferior varieties will disqualify a stand, it will be the means of improving the taste of the public for these beautiful flowers, by bringing the finest sorts under their observation.*

Fairy Rings.—*G. S.*—The rings or circles of dark green Grass observed in the autumn in lawns and pastures are caused by the decay of Fungi, which grow where the rings appear. Such rings will extend every year until they touch, and then at the lines of contact disappear—a very curious fact, arising, it is supposed, from Fungi being unable to exist in ground which other Fungi have previously occupied. It is thought that the luxuriance of the grass in these rings is owing to the nitrogen the Fungi contain.†

Paint.—*R. S.*—We prefer, for painting out door wooden buildings, the black mineral paint. ‡

Leaden Wire.—*E. W. S.*—We never heard that the leaden wire which is used for tying up plants produced an injurious effect upon them, but such an occurrence is not improbable. ‡

Garden Varieties.—*W.*—We do not understand you. Do you mean to say there is to be no improvement in any of the races of plants; that a wild Cabbage or a wild Carrot is as fit for cultivation as the domesticated races; that a wild boar is as well suited to the farmer as a Chinese hog; that a wild horse is as well suited to the brewer as a dray horse? Surely not. How then can you complain of what are called improvements in fancy flowers? Such deviations are produced by the skill which God has given to man, and may be regarded, without offence, as a homage paid by man to his Creator. We are sure, when you reconsider the matter, that you will see you have looked at the question through a false medium. †

Miscellaneous.—*A Subscriber from the commencement.*—From the appearance of the specimens sent, 1 appears to be a Cyrtopódium; 2, a Tillandsia; and 3 is probably a Cattleya.†——*Kensington.*—We cannot agree to your proposal.——*A Subscriber.*—We are sorry that we are unable to assist you, but we cannot reprint the articles you mention.‡——*H. E. B.*—Your Ferns are, 1, Aspidium acrostichoides; 4, 8, A. aculeatum; 7, 9, A. Filix-mas; 5, 10, A. spinulosum; 2, Asplénium Filix-fœmina; 3, Cistopteris dentata; 6, C. fragilis.——*W. G. B.*—We mentioned a dozen good Chrysanthemums in our Notices to Correspondents last week, and a few more are named in our Garden Memoranda of to-day.‡——*Flora.*—Two of your seedling Correas, Nos. 1 and 3, are very pretty; but 2 is too much like C. alba, and is not worth growing. No. 1, with a crimson tube, tipped with green, is the best, and is a fine flower; the colour of No. 3, which is a pale brick red, is also good.‡——*S. H.*—We cannot make out the meaning of your question.†——*A Constant Reader.*—Your plant appears to be Jasminum heterophyllum, a greenhouse climber from India, with white flowers; it is a difficult plant to bloom ‡——*W. H. M.* will see what use we have made of his communication.——*S. R. S.*—The Orchidaceous plant is Maxillária picta. The other we are not acquainted with.†——*J. Griffin.*—Your plant is Stanhópea Wárdii.†——*P. B.'s* questions we hope to answer shortly by giving the history of the pest; in the mean while we can only inform him that there are two certain remedies for destroying the maggots of moths: one is to subject the infested Corn to a degree of heat sufficient to kill them; the other is by evaporating spirits of turpentine where the Corn is housed. *R.*——*Inquisitor's* beautiful velvety black larvæ found upon a dead mole, will change in the spring to a beetle named Telephorus rusticus, or an allied species, but better known by the appellation of "Soldiers and Sailors." *R.*——*J. L. S.*—We shall probably do what you suggest some day, but we have at present other matters that press upon us more, and to execute your plan properly would require a good deal of preparation. However, we are well disposed to it, and agree with you in thinking that it would be both useful and interesting.†——*νηρο.*—We do not approve of your list of Strawberries. It contains names that we know nothing about. What, for instance, is the Emperor, the Lady's Finger, the Green-fleshed Pine (the Pine-apple?) and the Princess Royal (the Elton?) †——*Nicholas Nickleby.*—Your Pelargoniums are all worth preserving, if you grow them for the purpose of exhibition. Sidonia and Lady Bulteel may be dispensed with.*——All the varieties of Pears you mention will succeed as standards. The Dunmore is the earliest among them; the Hacon's Incomparable, Forelle, Winter Crassane, Jean de Witte, and Ne plus Meuris, are winter varieties: and the others ripen in autumn. ——*S. S.*—Your list does not differ materially from that published. Constancy and variety of colour formed a consideration in the flowers selected.*——*Buty.*—It is impossible to say with certainty what a Grape is, after it has been crushed in a letter; but yours appears to be the Chasselas Musqué. Of the articles which you had sent for nitrate of soda, No. 1 is that substance in an impure state; No. 2 is something else with which we are unacquainted. ‡——*J. Davis.*—We are not acquainted with the material you mention.——*Amateur* shall be attended to next week.——*B. Fielder.*—Your Pear, No. 1, is not the true Knight's Monarch; 2, is correct; 3, received from the nurseries for the Beurré Spence, is the Winter Orange; 4, Glout Morceau; 5, Winter Nelis, which is excellent. The Apple is the Golden Harvey. ‖——*C. C. B. P.*—Your Apples are, No. 1, Royal Russet; 2, Keswick Codlin; 3, Alfriston; 4, Margil; 5, King of the Pippins; 6, is called, though rather improperly, Early Red; 7, Ribston Pippin; 8, Wyken Pippin; 10, Dumelow's Seedling. ‖——*J. R. Northaw.*—Your Pears are, 1, Glout Morceau; 2, Flemish Beauty; 3, Napoleon. The Apples are, 1, Blenheim Pippin; 2, King of the Pippins; 3, Alfriston: ‖——*Tristan.*—Your Apples are, No. 1, Kirke's Lord Nelson; 2, Robinson's Pippin; 3, Wyken Pippin; 4, is some cider Apple, unknown. ‖——*S. Colehy.*—Your Apples are, No. 1, Franklin's Golden Pippin; 2, Waltham Abbey Seedling; 3, Rymer; 4, Hollandbury; 6, Winter Pearmain; 7, Fearn's Pippin; 9, Yellow Ingestrie. The Pear is the Glout Morceau.‖——*J. M'Donald.*—Your Pear when received was considerably decayed; it appears to be the Marie Louise. ‖——*R. S.*—Your Apples are, No. 2, Coccagee; 8, Barcelona Pearmain; 14, Api Noir; 15, Tower of Glammis? 20, Manks Codlin; 21, Green Codlin; 23, Beachamwell; 24, Famagusta; 40, Norfolk Paradise; 45, King of the Pippins. The Pears are, 1, Urbaniste; 3, Crassane; 4, Catillac. The following are good early Pears:—Dunmore, Summer Francréal, and Citron des Carmes. The best Apples to succeed the Ribston Pippin are the Reinette du Canada, Boston Russet, Golden Harvey, and Court-pendu Plat. For a greenhouse the most suitable black and White Grapes are the Black Prince and Royal Muscadine. ‖——*G. B.*—Your Pear is the Beurré Diel.‡——*Discipulus's* insect is the larva of the common Cockchafer (Melolontha vulgaris), so injurious at that period of its existence to the roots of plants, and equally mischievous when it becomes a beetle, by consuming the foliage of trees and bushes. *R.*——*Critic's* No. 2 are Julus pulchellus, figured and described in the *Gardeners' Chronicle,* vol. 1, p. 196; and No. 3 contained some shells of the Turbo (Clausilia) nigricans. We are much obliged to him for No. 1. *R.*——*B. T. P.*—Your Pears are, 1, Grande Bretagne Doré; 2, Duchesse d'Angoulême; 3, Beurré Rance; 4, Easter Beurré; 5, Easter Bergamot; 6, Bishop's Thumb. The Apples are, 1, and probably 2, Dutch Mignonne; 3, Margil; 4, Syke-house Russet; 5, Manks Codlin; 6, Paradise Pippin; 7, Christie's Pippin; 8, Embroidered Pippin. ‖——*T. K. S.*—The article upon Guano has already appeared. ‡

Erratum.—In No. 46, p. 758, column *a*, line from the bottom 28, for "the plants should be from five to seven inches in circumference," read "from five to seven inches in diameter."

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The Overland mail from India arrived in town on Saturday with accounts from Cabul to the 1st October, and from Nankin to the 16th September. The intelligence thus received is substantially the same as that brought by the intermediate mail a fortnight since; but, although the leading facts are thus anticipated, everything which was wanting in those advices is now satisfactorily supplied. Captain Bygrave, the last of the prisoners in the hands of Akhbar Khan, was surrendered to Gen. Pollock on the 27th Sept.; and the other prisoners reached Cabul in safety on the 21st, under the escort of Sir Robert Sale and Sir Richmond Shakspeare. The most interesting portion of our news is that connected with their escape; no romance was ever written more exciting in its details, or more abounding in perilous adventure. Gen. Pollock, in his official despatch, states that a delay of twenty-four hours would have been fatal: the troops of the Affghan chief were in hot pursuit; and orders had been issued to put to death such prisoners as were too weak to proceed, and to carry off the survivors in slavery to Turkistan. The army was expected to march from Cabul on the 10th October; and it was said, that on evacuating the city, the whole of its magnificent fortifications, and the grand bazaar which travellers have so long celebrated, would share the fate of Ghuznee and be levelled to the ground.—From China our news is also satisfactory: the Emperor has given his assent to the treaty concluded by Sir Henry Pottinger, and has agreed to sign it as soon as it has received the ratification of her Majesty. One half of the first instalment, amounting to 6,000,000 dollars, has been paid, and is now on its way to England in the Blonde frigate. The troops and the fleet were still at Nankin, but were to winter at Chusan, where extensive works had been undertaken to drain the land and prepare it for their occupation.—From France we have no political news, except a confirmation of the rumour received from the United States last week, that the French Government has seized the Marquesas Island, with the intention of establishing a colony in the Pacific. —From Spain we learn that the Regent arrived at Barcelona on the 29th, and demanded an unconditional surrender, under a threat of immediate bombardment. The insurgents refused any kind of capitulation, unless they obtained concessions such as no General could grant: they demanded the dismissal of General Zurbano, and of General Van Halen; an immediate change of the troops in garrison; and the maintenance of the National Guard, by which the insurrection had been commenced. These terms were of course rejected, and the accounts received this morning by the French telegraph state that the bombardment commenced on the morning of the 3d, that the people threatened to hoist the French flag rather than surrender, and that Catalonia is rising in order to succour Barcelona. Some doubt exists of the authenticity of this news, and the next arrival will probably show that it is exaggerated.—By the Levant Mail we have satisfactory accounts of the negotiations with Persia. The Shah had accepted the joint mediation of this country and Russia; and all the differences with Turkey are likely to be soon adjusted. Sir Stratford Canning has also communicated to the Turkish Minister the determination of the British Government to abide by the engagements entered into with the Maronites on behalf of the Porte, and has insisted on the appointment of a Christian and Native Chief to the Governorship of the Lebanon.

At home, a Privy Council will meet this afternoon to fix a day for the re-assembling of Parliament. The disturbed state of Ireland continues to be the cause of much anxiety; the system of combination which spread terror over some of her most fertile provinces last year, is again abroad, and the landlord and his agent are not secure from the hand of the assassin, either in their own houses, or in the streets of the provincial towns. The agricultural districts of England are also harassed by a renewal of incendiary fires, and we regret to find that every week supplies some fresh instance of the destruction of property.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, returned to Windsor Castle from Walmer on Saturday in excellent health. It is now announced that her Majesty's accouchement is expected to take place in the early part of March. The Archduke Frederick of Austria arrived on Tuesday on a visit to her Majesty. His Imperial Highness returned on Saturday from Strathfieldsaye, and on Monday visited the London and St. Katherine's Docks, the brewery of Messrs. Barclay and Perkins, and the Custom House. Prince Albert and the Archduke came to town yesterday, and visited the Smithfield Cattle Show. The Duke and Duchess of Cambridge and the Princesses returned to town on Tuesday from their visit to the Duke of Beaufort at Badminton, and proceeded to Strathfieldsaye, on a visit to the Duke of Wellington. The Duchess of Kent has returned to Frogmore from a visit to the Queen Dowager, in Dorset. The Hon. Frances Devereux has succeeded Lady Caroline Cocks as one of the Maids of Honour in Waiting. Viscount Sydney and the Hon. Capt. Duncombe have succeeded the Earl of Hardwicke and Sir F. Stovin as the Lord and Groom in Waiting on Her Majesty. The Hon. Col. Grey has succeeded Lord C. Wellesley as the Equerry in Waiting on the Queen, and Major-General Sir E. Bowater has succeeded Col. Wylde as the Equerry in Waiting on Prince Albert.

Metropolitan Commission.—We noticed in our Metropolitan News of last week that Government had appointed unpaid commissioners for inquiring into and considering the most effectual means of improving the Metropolis, and of providing increased facilities of communication within the same. Some error having occurred in regard to the names of the commissioners, a notice appeared in the *Gazette* of Tuesday, substituting the following names for those previously published: the Earl of Lincoln, Lord Lyttelton, Lord Colborne, Right. Hon. J. C. Herries, the Lord Mayor, Sir R. H. Inglis, Sir C. Lemon, Mr. H. T. Hope, Mr. Gally Knight, Mr. Alexander Milne, Hon. Charles Gore, Sir R. Smirke, and Mr. Charles Barry. The Queen has also been pleased to appoint Mr. Trenham Walshman Philipps to be Secretary to the Commission.

Public Pensions.—The *Times* has this week announced that the omission of Sir R. Sale's name from the list of honorary distinctions granted to the Generals commanding in India, arose from the circumstance that the gallant officer had already received for his defence of Jellalabad, the same distinction which has now been conferred on the other Generals. Under these circumstances, it adds, "it has been notified to the Governor-General of India, in compliance with his recommendation, that Government will propose to Parliament to grant to Sir Robert and Lady Sale, with the benefit of survivorship, an annual pension of 500*l.*, as a special public recognition of signal merit."

Foreign.

FRANCE.—There is little intelligence of political interest in the Paris papers; the observations on English policy are chiefly directed to Lord Ellenborough's proclamation from Simla, which is severely handled by the *National* and the *Presse*. The latter, the organ of His Majesty and the Court, says, "It is amusing to observe how the Governor-General conceals the moral signification of his retreat. He abandons the Affghans to their anarchy! He quits their country in order to punish them! With such nonsensical rhodomontade does he seek to disguise the necessity under which England finds herself of abandoning all influence over Central Asia. As to fear from Russia, which was the cause of the expedition, Lord Ellenborough cavalierly declares there is none. And his lordship manifests his delight that England has failed in her aims. Lord Ellenborough is a governor full of philosophy."—At the beginning of the week Paris was visited by the densest fog that had occurred since the winter of 1829, which preceded the great frost of December of that year, and January and February of 1830. It prevented all communication by telegraph, and was the cause of numerous accidents in the streets.—The *Moniteur* publishes a Royal ordonnance providing that the proceeds of the subscription entered into by the army and navy for the purpose of raising a monument to the memory of the Duke of Orleans shall be applied to the erection of two equestrian bronze statues of the Prince, the one in Paris, and the other in the principal square of Algiers. By virtue of the same ordonnance, the triumphal arch of Djimilah (Cuicullum), the most complete of the Roman monuments discovered by the French in Africa, is to be taken down stone by stone, and transported to Paris, where it is to be erected as it now stands, agreeably to a wish manifested by the Duke of Orleans during his expedition from Constantine to the Iron-gates.—A model of the tomb of Napoleon has been exhibiting in Paris for some days; the tomb will shortly be commenced, and the equestrian statue of the Emperor will be placed in the middle of the great court of the Invalides. —There is no longer any doubt of the occupation of the Marquesas Islands, in the Pacific, by the French Government, as mentioned under our United States news of last week. The *Presse*, Ministerial paper, of Tuesday, admits the fact, and states that the occupation was the concealed object of the expedition of Admiral Dupotet Thouars, who visited these parts before, and on whose reports Government decided on the occupation of the islands. The group of the Marquesas forms the eastern extremity of the Polynesian Cyclades; and should the Isthmus of Panama be rendered available for the passage of travellers and merchandise, they will afford the first land, and the first port, that vessels will make in the Pacific. The possession is of great importance, especially to a nation having a large trade with the coasts of Asia.—The water from the Artesian well at Grenelle continues to ascend to the top of the Belvidere in uniform abundance, perfectly pure, and of the same warm temperature. To ascertain the precise quantity thrown up, M. Mulot placed a tank of 1,800 litres (475½ gallons) in a position to receive it. At first it took 40 seconds to fill this reservoir; but M. Mulot suspecting that a large portion of the water was lost between the new tube and the old one, which collapsed, had the space between them filled with sand. When this was accomplished, the reservoir became full in only 28 seconds, and at this rate the flow continues regularly.

Algeria.—Letters from Toulon mention the arrival of Major-Gen. d'Arbouville, of the brigade of Mostaganem, and M. Lelievre, Chef de Bataillon, both of whom have been suddenly recalled, in reference, it is said, to the affair of Mazagran, which we noticed last week. It is stated that M. Lelievre's disgrace is positive, and that the statement of the *Morning Chronicle*, that he had imposed on the Minister of War, by gross exaggerations of the defence of Mazagran, is perfectly accurate.

SPAIN.—The Barcelona insurrection is not yet at an end. The insurgents have refused to capitulate, and, if the French telegraph may be relied on, the Regent has begun to bombard the city. The Regent reached his head-quarters, outside the walls, on the 29th, when a salute of 21 guns announced the news to the town. Gen. Van Halen abstained from his threatened bombardment, when he found that the Regent was so near at hand. The new Junta, with the bishop at their head, assembled in the evening, but decided nothing. The whole of the following day was spent in negotiations, and at length the Junta demanded that Generals Van Halen and Zurbano, as well as the political chief, should be removed from their commands in Catalonia; that the National Guards should remain armed, and that there should be no *quientos*, or conscription. These terms were refused by the Regent, who insisted on an unconditional surrender. He even refused to receive a deputation of the Barcelonese, to the number of four, with the Bishop at their head. He would not listen to any proposition. He insisted on the disarmament of the whole National Guard, and surrender at discretion of the persons implicated in the movement. He insisted on declaring the town in a state of siege, and bringing into it a military court-martial to try the culpable, presided over by Zurbano. The Consultative Junta assembled the National militia and the principal inhabitants, to ask them whether they would submit to these conditions. They declared for resistanc but nevertheless a great number of inhabitants took refu on board the foreign vessels in the harbour. This state of things had not improved on the afternoon of the 2d; the drums were then beating to arms, and the Junta were going to re-arm the *corpos Francos*, and make a desperate resistance. The Regent had signified his determination to bombard irrevocably, if the town did not surrender by ten o'clock on the morning of the 3rd; and the accounts received this morning by the French telegraph state that the bombardment actually commenced on that day, that the firing continued when the accounts were despatched, and that the whole of Catalonia was rising to aid Barcelona, crying, down with Espartero and the English, and "Vive la France." It must, however, be borne in mind that this is the mere rumour of the telegraph, and not an official despatch; and that it therefore requires confirmation. The whole of the troops left in Barcelona when that city was evacuated by the Captain-General, amounting to 2,800 men, had joined their respective corps, with the exception only of a few artillery drivers left in charge of the horses. All the half-pay officers resident in Barcelona, including several of the Royal Guard, formerly so notorious for their hostility to the Queen, had retired from that city, and taken refuge on board the ships in the harbour. Abdan Terradas, the Republican chief, who had attempted to raise an insurrection at Lampourdan, finding armed resistance wherever he presented himself, had taken refuge in France, and had arrived at Maureillas, so that all the leading revolutionary persons had secured their safety by flight previous to the Regent's appearance. Gen. Zurbano had been fired at in the neighbourhood of the town, but the assassin missed his aim. We regret to state that H.M.S. Formidable, of 90 guns, got aground on the 29th, at nine o'clock in the evening, near the mouth of the Llobregat. Two French steamers were sent to her assistance by the commandant of the station, and after great exertions for two days, they succeeded in getting her off the bank of sand on which she struck. Private letters give great praise to the conduct of the French naval officers, and state that without the assistance of their steamers, the Formidable would most probably have been lost.

PORTUGAL.—By the Lisbon mail we have accounts from that capital to the 29th ult. Nothing new has transpired respecting the tariff question. The election for 20 deputies to supply the vacant seats had all terminated in favour of the Government. The Chambers had been further adjourned till the 28th December, when the extraordinary session would be closed, and the Chambers prorogued till the 2d January, the legal period for opening the ordinary session of 1843. There had been rumours of a partial change in the Ministry, but there appeared to be no truth in them. The storm against M. Dietz was subsiding, but it was thought not unlikely that some motion will be made for an address to remove him when the Chambers meet.—The first subscription of the British residents in Madeira for the sufferers by the late inundation amounted to 1,200 milreis (about 300*l.*) The "national subscription" at Lisbon, as might have been anticipated, is going on very slowly.—The accounts of the fruit trade this season are very satisfactory. The supply of oranges this year to London is said to be 58,183 boxes from St. Michael's, 6,096 boxes from Fayal, 9,763 boxes from Terceira, and 41,872 chests and boxes from Lisbon, independently of the large quantities sent to the out-ports.

GERMANY.—Letters from Berlin state that all the provincial assemblies will be convoked in March, and that the Minister has intimated to the committees the probability that they may soon be requested to meet again in Berlin. It is said that one of the Deputies of East Prussia replied to this observation by drawing the Minister's attention to the too great restrictions in the regulation of their proceedings, and expressed a wish that many parts might be changed—a remark which was received with general acclamation by the other deputies. His Majesty has at length granted the repeated requests of M. Von Ladenberg, Minister of State, to retire from public service, in consideration of his age and infirmities. The Minister accordingly retired on the 1st inst., and was succeeded by the Count of Stelburg Wernigerode. The *Leipsic Gazette* gives the following Court gossip, under the head Berlin, Nov. 24:—"The celebrated poet, Geo. Kerwegh, was presented, a few days ago, to the King, by one of his physicians, M. Shoenlen. His Majesty, after having conversed for a long time with the young poet, who is very liberal in his opinions, said, "I have already had this year a visit from one of my adversaries, M. Thiers, but I prefer yours. I have to perform my mission as King, and you yours as a poet. I shall be faithful to mine, and I desire that you may be faithful to yours. I do not like want of character. A warm opposition, founded upon conviction, pleases me. I like your poetry, although it contains sometimes bitter pills for me; but, I assure you, they are less bitter than those which Shoenlen administers to me from time to time."—We learn from Vienna that the Post-office Treaty between the Austrian Government and that of Baden has just been ratified on both sides. The Frankfort papers state that the expense of erecting the new fortresses of Ulm and Rastadt is estimated at 30,000,000 of florins. This sum will be paid by the several States of the Confederation to the treasury, according to their population, and in proportion as it may be required. The amount of the portion of the French contribution, which was placed at interest in the house of Rothschild, and which was at that time 22,000.000 of francs, is to be deducted. The citizens of Hamburg, in compliance with a proposal made to them by the senate, have adopted a law, by which the Jews are to be henceforth qualified to hold freehold property, and reside in any part of the State. Hitherto, Jews have been authorised to reside and hold property only in one or two streets of the city.—Letters from Hanover state that Dr. Langenbeck, who was sent from Gottingen to attend the King when he was taken ill on his last visit to Rothenkirchen, has given his Majesty the most favourable assurance of his probably attaining a great age.

Belgium.—The Brussels papers announce the arrival from Paris of M. Plongoulin, the barrister, who is to defend M. Caumartin, the gentleman concerned in the affair noticed in our last. It appears that M. Caumartin is much esteemed at the Paris bar, and that the most eminent advocates, including M. Dupin, have offered to act as his counsel. According to the declaration made by M. Caumartin to his counsel, the affair appears in a very different light from that which it assumed when first reported. It is said to be attested by the driver of the carriage who drove M. Caumartin to fetch a physician, that he was very severely wounded by a sword-cane; it is also stated that he does not intend to avail himself of the exercise of legitimate defence, but to assert that the fatal consequences of the struggle were occasioned by M. Sirey himself, who precipitated himself on the weapon which caused his death.—The papers announce that the offices for the verification of passports on the Belgian frontiers are about to be suppressed, and a new system adopted, which will be less annoying to travellers.

Greece.—Letters from Athens of the 20th ult. announce that the long-expected crisis which the King would never believe to be possible, has at last arrived: the Director of Finances has been obliged to declare, not only a deficit of two millions, but the impossibilty of meeting the demands even of the present month. A council of state was immediately convened, and a law was passed annulling the financial system introduced by the French agents, which has led to these results. A modification of the ministry will also be necessary. In the mean time the King is making extraordinary preparations for the completion of the new palace, and intends shortly to inhabit it.—Professor Asopius, considered the best Hellenic scholar among the modern Greeks, and who was for many years one of Lord Guildford's professors at Corfu, has lately been appointed to a chair in the University of Athens, and draws crowds to hear his lectures.

Turkey.—We have advices from Constantinople to the 17th ult. Sir Stratford Canning and M. Bouteneiff, the Russian Ambassador, have both addressed notes to the Porte, with reference to the negotiations with Persia. They state that the Court of Teheran has accepted the joint mediation of England and Russia, and that the views and disposition of the Shah continue to be most pacific. Hopes therefore are expressed that, with similar sentiments existing on the side of the Turkish Government, their differences may be easily accommodated without an appeal to arms. Sir S. Canning has also had an interview with the Turkish Minister, to communicate the determination of the British Government with respect to the Syrian question, upon which, after the conference of September, there had been another and final reference made to it. The answer is said to be peremptory, and intimates the resolution of England to abide by the engagements she had entered into with the Maronites on behalf of the Porte, which has at length been told that it must consent to the appointment of a Christian and native chief of the Lebanon. —Letters from Beyrout, dated Nov. 1, announce, with expressions of satisfaction, the withdrawal of Mustapha Pacha, whose ten months' rule had so completely revived the animosity of the Druses and Maronites, as to put a period to their own quarrels, and reunite them against the Turkish troops.—From the Danube we have accounts that the Boyard, George Philipesko, will succeed to the vacant Regency of Wallachia, unless the Russian ex-General Kislef should obtain such a majority as would give an appearance of popularity to his election. Belgrade letters of the 21st announce the arrival at Semlin on that day of Rifaat Pacha, the new Ambassador of the Porte to the Court of Vienna. Prince Michael learnt from the Envoy that his doom was definitively sealed, and that Prince Georgewitch would be maintained in his new position. It is expected that Russia will give her sanction to this arrangement. The new Prince of Servia had issued a proclamation, promising his best exertions for the prosperity of the people.

Egypt.—Letters from Alexandria to the 22d ult. state that the Pacha is still in the Delta, making arrangements, in order that the sowing season may not be retarded. The mortality among the cattle still continues, and is now prevalent among the small farms surrounding Alexandria, which have hitherto escaped. Horses, mules, and donkeys are being bought up by the government, and sent to the shifliks to assist in agriculture. In many of the villages the fellahs have been obliged to commence sowing without plowing, merely casting the seed on the mud left by the inundation, into which it is pressed by the weight of a man drawn over it upon a board by horses. There is little doubt that the continuance of the murrain will seriously affect the crops of next year. There is no political news, except the arrival by the last French steamer of General Ventura, of Lahore celebrity, so long in the service of the late Runjeet Sing; he proceeds to India by the Suez steamer, and is the bearer of valuable presents from Louis-Philippe to Shere Sing.

India.—The Overland mail from India reached town on Saturday night, with accounts from Cabul to October 1, Jellalabad to Oct. 6, Chusan to Sept. 15, and Nankin to Sept. 16. The intelligence was in a great measure anticipated by the intermediate mail received a fortnight since, but the details of the subsequent operations and events are highly interesting. All that was wanting in the last accounts to make the news from Affghanistan perfectly satisfactory, is supplied by the advices now received. Akhbar Khan, on learning that all the prisoners, save Capt. Bygrave, whom he had in immediate attendance upon himself, had been surrendered to the British authorities, came to the resolution of giving up that officer also. Capt. Bygrave was accordingly sent to General Pollock's camp, on the 27th Sept., with a letter from Akhbar Khan to the General, stated to contain an inquiry as to what the British intended to do with his father and his family. The whole of the prisoners have therefore been liberated from the hands of the Affghans. Their number was 31 officers, 9 ladies, and 12 children, with 51 European soldiers, 2 clerks, and 4 women, making in all 109 persons, who had suffered captivity from the 10th January, to the 21st and 27th September. They had a narrow escape at the last, Akhbar Khan having openly threatened them with slavery in the event of the British moving on Cabul. The details of their proceedings are more like a romance than a passage of authentic history. We have given under our "Miscellaneous" article a letter from one of the captives, who conducted the negotiation for their ransom; to that graphic narrative of an eye-witness, so much more interesting than the mere summary of the Papers, we will simply add, that after the prisoners had succeeded in making terms with the commander of their escort, they set out on their march towards Cabul. They were crossing the Kaloo mountains when they met the Kuzzilbashes, under Sir Richmond Shakspeare, who had advanced in the most gallant manner by forced marches of 90 miles a day. Two days afterwards the party again descried the advance of British colours, and in a few hours they were joined by General Sale and the force which had left Cabul on the 15th. The meeting of the captives with their friends is described as most affecting, and is said to have drawn tears from every eye. The scene between the gallant Sir R. Sale and his heroic wife and widowed daughter, who had been eight months in captivity, must be left to the imagination of the reader; no pen, as the Indian Papers observe, could be trusted to depict the emotions excited by that meeting. On the morning of the 21st, they all arrived in camp, under welcome of one of the most joyous royal salutes ever fired, and the greatest delight everywhere prevailed. The escape of the prisoners was opportunely planned, for the orders received from Akhbar Khan, by Salih Mahomed, on the night when the latter was gained over, were to put to death such captives as were too weak to proceed to Kholoon, while the fate intended for the survivors was a life of slavery in the wilds of Turkistan. Had the force, too, under General Sale, not been despatched to the Arghundee pass, they would have fallen into the hands of Sultan Jan, who was in hot pursuit, and General Pollock in his despatch states that a delay of 24 hours would have proved fatal.—The operations in other quarters have also been important: Quettah has been abandoned, and we have now no longer any troops in Affghanistan westward of Cabul. The last detachment of General England's force left on the 1st, and reached Dadur on the 7th October; the rear-guard having been attacked in the Bolan Pass, and some lives lost, Dr. Brickwell, who was sick, fell into the enemy's hands, and was cut to pieces. The first detachment, under command of Major Reid, reached Sukkur on the 12th; and the second, under Colonel Marshall, was expected at Shikarpore on the 16th. On the 26th Gen. M'Caskill and Brigadiers Tulloch and Stacey left Cabul on an expedition towards Kohistan with about 4,000 men. On the 29th they encountered Ameen Oolah at Istalif, twenty miles from Cabul, on their way to Charekar, and defeated his army with immense loss. The Affghans advanced with great intrepidity, but were beaten back and scattered in all directions. Our casualties consisted of 1 officer (Lieut. Evans, of the 41st) killed and 4 wounded, with 646 men killed and wounded. The troops were expected in camp by the 5th October, and were to march into the Passes for Peshawur on the 10th or 12th. All the ordnance left at Cabul has been recovered, together with the park of artillery captured on the flight of Dost Mahomed on our original advance in 1839, which has since been kept in the Bala Hissar. The city is described as being full of plunder; our former cantonments are in a state of ruin, and the walls of the citadel itself were found to have suffered severely from the guns of Akhbar Khan during the siege in April. It is said that not only the walls of the fortress will be blown up, but that the grand bazaar, the wonder of travellers and pride of Cabul, will be destroyed. An attempt was made by Futteh Jung, son of Schah Soojah, to place himself on the throne while the salute was firing in honour of our colours being hoisted on the Bala Hissar; but the scheme was of no avail; and he will no doubt be made to retreat with the armies. The army, on its advance, had, as they expected, met with numerous skeletons of the men who had perished in January; some hundreds of them were buried—many of them were so little decomposed as to be still recognisable. The number seen does not appear to have exceeded a thousand in all; yet an army, with camp followers, computed at 13,000, had disappeared in the Passes. From this circumstance many are said to entertain hopes that the destruction of our troops was much less than was supposed, and that some survivors of that terrible scene are still in existence beyond the Indus. At Ghuznee, besides the sepoys who were released, Col. Palmer, who was long supposed to have been killed, was found among the prisoners. Among the trophies which General Nott brings back to India, are the celebrated sandal-wood gates which a Mahometan conqueror had taken away from an Indian temple, and which had, during nearly eight centuries, formed the chief ornament of his tomb at Ghuznee. The Governor-General published on the 1st Oct. his proclamation for the entire evacuation of Affghanistan, with others conferring honours, medals, &c., on the regiments employed at Candahar, Ghuznee, Cabul, &c. On the 7th he issued another proclamation announcing the release of part of the prisoners, and on the 17th he published another announcing that all the prisoners were restored. In another he announces the termination of the war with China, and directs the distribution of medals and other honours to the Indian soldiers and sailors employed in that campaign. The camp of the army of reserve at Pinjor, near Sirhind, was to be formed about the middle of November. There is still some disquietude in Bundelkund, but India otherwise is tranquil. The Governor General and the Commander-in-Chief were expected to leave Simla towards the end of October, in order to meet the army of reserve and the other troops in the vicinity of the Sutledge. A court-martial will, it is said, be held on General Shelton, Colonel Palmer, and four other officers, immediately on their return to India. The burning of merchant ships continued. The Jessy has been destroyed by fire at Calcutta, and the Belvidera at Singapore.

China.—By the Indian Mail we have accounts from the fleet off Nankin to the 16th Sept. The Emperor has given his assent to the terms of the treaty, but, from scruples of etiquette, has refused to sign it until the plenipotentiary has a copy under the sign manual of the Queen ready for exchange. Major Malcolm has been sent to England with a counterpart of the treaty for ratification by her Majesty, and will return with it to China as soon as possible, when the formal exchange of treaties will take place. Half of the first instalment, amounting to 6,000,000 dollars, has been paid, and is now on its way to England in the Blonde. The English fleet will winter at Chusan, where extensive works have been undertaken to drain and make it healthy. It is said that the Emperor still intends to send an ambassador to England, and that an application has been made to a Surgeon of one of the principal hospitals in London, requesting him to receive a young Chinese into his house, as a student of surgery.

United States.—The packet ship North America, arrived at Liverpool on Wednesday, with dates two days later than those brought by the Great Western. The interest of the news is entirely local, the papers being occupied with the speech of Governor M'Donald to the Legislature of Georgia, in which he condemns the injustice of the new tariff and the establishment of a national bank. Great excitement had been occasioned at New York, by the marriage and suicide of a criminal, J. C. Colt, on the morning appointed for his execution. He had been condemned some months ago for the murder of Mr. Adams, and a few hours before the time fixed for the execution he was married, in the presence of the sheriffs and officers, to one of the witnesses on the trial. He afterwards stabbed himself with a clasp-knife; and at the moment when this was discovered, the city prison was found to be on fire. Several investigations had been held, but nothing had transpired when the packet left.—The papers mention a rumour that Sir C. Bagot, Governor-General of Canada, finds it necessary to leave Kingston on account of his health, and that the seat of Government is likely to be transferred to Montreal or Quebec.

West Indies.—The mail steamer Solway arrived at Falmouth on Saturday, with news from the West Indies to the 3d Nov. The principal intelligence from Jamaica consists in the meeting of the Legislative Assembly. The speech of the Governor, which embraced topics that chiefly concerned the interior administration of the island, had given much satisfaction, especially the portion relating to internal communication. The plan for opening new roads, as well as that for improving those already in existence, would, it was supposed, do much towards reducing the expense of forwarding the produce from the several estates to the ports of shipment, by which the loss of the planter would be much lessened. The topics of the greater part of the speech are merely of domestic interest. The address in answer to it was passed without the slightest opposition. The Solway left Southampton on the 15th June last, since which she has touched at thirty different ports, at many of them twice. During this period, it is calculated that she has run over a distance of 21,000 miles without meeting with any other accident than the loss of her jib-boom in a severe hurricane. In this space of time eighty-six cases of yellow fever occurred on board, eight of which only proved fatal.

Cape of Good Hope.—Cape of Good Hope papers to the middle of September are in town. They again treat of a local Legislature, and of the adoption of other changes considered to be necessary to the colony. Measures were taken to give force and effect to the opinions entertained on the subject. The only additional particulars in reference to the recent wrecks in Table Bay, are the announcements that Beaumont Smith, of Exchequer Bill notoriety, was among the convicts saved from the wreck of the Waterloo, and that all the convicts have been sent, for safety, to Robin Island under a military escort.

CITY.

Money Market, Friday.—Consols for the account closed at 93⅞ to 4, ex div.; Three-and-half per Cents. Red., 100⅞; Bank Stock, 172½ to 173½; Three per Cents. reduced, 94½ to ⅝; Exchequer Bills, 47*s.* to 49*s.* prem. India Bonds, 43*s.* to 45*s.* prem.; and Long Annuities, 12⅝.

Metropolis and its Vicinity.

Common Council.—On Thursday a Court was held, in consequence of a requisition, "To take into consideration the propriety of passing resolutions, expressing the urgent necessity of an abolition of all restrictions upon commerce and manufactures, and especially those affecting the importation of Corn." It was very numerously attended, and the subjects of the requisition were discussed at considerable length. After several motions and amendments had been disposed of, the following resolutions were adopted: "That the continued and increasing depression of the manufacturing, commercial, and agricultural interests of this country, and the wide-spreading distress of the working classes, are most alarming. Manufacturers without a market, and shipping without freight, capital without investment, trade without profit, and farmers struggling under a system of high rents, with prices falling as the means of consumption by the people fail, a working population rapidly increasing, and a daily-decreasing demand for its labour, union-houses overflowing as workshops are deserted, corn laws to restrain importation, and inducing a starving people to regard the laws of their country with a deep sense of their injustice—these facts call for the immediate application of adequate remedies. That this Court anxiously appeals to the First Minister of the Crown to give practical effect to his declarations in favour of free trade by bringing forward, at the earliest possible period in the ensuing session of Parliament, such measures for securing the unrestricted supply of food and the employment of the people, as may effectually remove a condition of depression and distress too widely prevailing and too rapidly increasing to consist with the safety of the community and the preservation of our social and political institutions."

British American Company.—A meeting of the consulting council of this association was held on Wednesday, Sir Joshua Meredyth, Bart., in the chair, for the purpose of appointing a committee to inquire into the various charges which have been made against the association. Our readers are already acquainted with these circumstances from the reports which we have given from time to time of the inquiries at the Mansion House, and from the correspondence between the late Lord Mayor and the Duke of Argyll. The object of this meeting was to remove the unfavourable impression produced on those occasions. The report stated that the despatches received from Sir Allan M'Nab show the manner in which the objects of the association are appreciated in Canada, and the support it will receive in that colony; the valuable tracts of land that will be opened to colonization by the association, with the approbation of the provincial government, and the legal recognition which the association will receive from the Legislative Assembly and Counsel. The meeting was addressed by Sir R. Brown, Dr. Rolph, the government agent for Emigration to Canada, and other gentlemen, and a committee was appointed to investigate the conduct of the company and all the charges brought against their management.

Smithfield Club.—The annual award of prizes given by the Smithfield Club Prize Cattle Show, for the best specimens of fat stock, took place on Tuesday. The total amount of money expended in prizes this year exceeds 400 guineas. The show is considered to be the best since 1839, when some remarkable animals were exhibited. In the two classes, which included Scotch and Irish oxen, there was less competition than usual, and in one of them both prizes are withheld, from want of merit. With these exceptions all the prizes were awarded, but the details have little interest for any but the parties concerned. On Wednesday the exhibition was visited by several well-known patrons of agriculture. The Earl of Warwick, Earl Spencer, and Lord Cottenham went round the yard at an early hour, accompanied by the stewards, minutely examining the specimens and expressing their approbation of the general arrangements. At a meeting of the members of the society, held during the morning, Earl Spencer in the chair, the judges' award was read over and confirmed, and a motion for the establishment of additional prizes was agreed to. The animal which has gained the gold medal as the best beast in the exhibition, was bred by Sir Charles Tempest, of Broughton Hall.

Income Tax.—The commissioners have commenced hearing appeals from the western district of the City, and have made such progress, that their investigations are expected to terminate this week. One arrangement was adopted which has greatly facilitated their labours—the surveyor being empowered to dispose of the cases of all clerks with salaries under 150*l.* a year, but who have nevertheless been required to make returns. These cases, in such a place as the City, must obviously form the great majority of the appeals; and by taking them out of the jurisdiction of the commissioners, their duties have been considerably lessened.

Public Meetings.—The half-yearly meeting of the proprietors of Waterloo-bridge was held last week to receive the report of the directors. The report stated that the tolls ending the 23d Aug., 1841, amounted to 7,473*l.* 15*s.*, while those for the corresponding period in this year were only 6,828*l.* 12*s.* 1*d.* The decrease in the tolls for horses and vehicles was 928*l.* 16*s.* 1*d.*, and the increase for foot passengers was 283*l.* 16*s.* 5*d.* The receipts for the past half-year, including 6,828*l.* 12*s.* 1*d.* tolls, with interest upon Exchequer bills and the rent of the arched vaults, were 7,541*l.* 17*s.* 11*d.*; and the expenditure, including 1,334*l.* 16*s.*, interest on bonds at 5*l.*, 4*l.*, and 3½ per cent., and 4,687*l.* 10*s.* dividends upon annuities, amounted to 6,908*l.* 8*s.* 3*d.*, leaving a balance of 633*l.* 9*s.* 8*d.* A proposal was made to raise the toll again to 1*d.*, but was negatived by a large majority.—The general meeting of the Regent's Canal Company was held on Wednesday, Mr. Drinkwater Bethune in the chair. The report stated that the affairs of the company were in a prosperous condition, the amount of tonnage for the last half-year being 459,945 tons, producing 18,027*l.*, with a prospect of further increase. The balance of profit for the last half-year was stated to be 10,204*l.*, and the amount of the reserve fund, 6,400*l.* It was then resolved, after some discussion, that the sums of 4,500*l.* and 485*l.*, for the improvements at Limehouse, be appropriated from the reserve fund.

Robbery.—In our Number of the 26th ult. we noticed the new apparatus for enabling the firemen to resist the action of the smoke; we also mentioned, that it had been used with great success at a fire in Friday-street, where the engineer traced the flames to a heap of waste paper in the cellar. It appears that the utility of the apparatus in enabling the brigade to trace the fire to its source, and thus save the premises, was not the only service which it rendered on that occasion. In the course of the firemen's operations a circumstance took place which excited suspicion. The engineer, after stopping the flames in the cellarage, in ascending a staircase to the front warehouse-room, stumbled against something bulky, and upon examining it, discovered it to be a ledger half consumed, and the remainder covered over with ink. He placed it in the warehouse with the intention of showing it to the firm, but while his back was turned it was taken away, and was afterwards found concealed behind the street door, evidently for the purpose of being purloined. Subsequently, in the course of the day, in consequence of further discoveries, a clerk, named John Snowdon, was examined by the firm as to the condition of the counting-house. His answers were unsatisfactory, and while the firm were considering the course to be adopted, he left the premises unobserved, taking with him notes to the amount of 500*l.* A large reward has been offered for his apprehension.

The Weather.—During the whole of Tuesday and Wednesday the Metropolis was enveloped in a dense fog, rendering it necessary to use lights in all the public offices and shops. The temperature throughout the day was much colder than on Monday, and the market waggons from the suburban districts were covered with hoar frost. On Thursday the Metropolis and suburbs were again, during the greater part of the morning, enveloped in a thick fog, so as to render it impossible to transact business without the aid of candle or gas light. Several minor accidents occurred in the principal thoroughfares, and the business of the River was almost entirely suspended.

Harrow.—The examination for the scholarship founded by Mr. J. Neeld was announced on the 3d inst. by the examiners to have terminated in favour of the Hon. P. Smythe, son of Viscount Strangford.

Mortality of Metropolis.—The number of deaths registered in the week ending Saturday, Nov. 26, was 853; being, Males, 429; Females, 424. Weekly average of 1838-9-40-1, Males, 467; Females, 445. The distribution of this mortality over the different districts was as follows:—West districts, 101; North, 160; Central, 182; East, 178; South, 232.

Provincial News.

Her Majesty's Return from Walmer.—Her Majesty and suite left Walmer Castle on Saturday morning, on their return to Windsor. On leaving the Castle, the Grenadier Guards, which were drawn up near the drawbridge, saluted the Queen as her Majesty entered the carriage, and the Thunderer, at anchor in the roads, fired a royal salute. The royal *cortège* proceeded through Sandwich, Ash, and Wringham, to Canterbury. In all parts of the route her Majesty's reception was most loyal and enthusiastic. In Canterbury some of the houses still bore the decorations before prepared, while a few others were dressed up with fresh evergreens. The royal standard was hoisted on Westgate Tower and St. Dunstan's Church, and as soon as her Majesty's arrival was announced, the Cathedral bells were rung. At 9 the royal party arrived at a rapid rate, and drove to the Fountain Hotel, where her Majesty and the Prince alighted, while a fresh relay of horses was obtained. The Queen left the Fountain Hotel at a quarter past 9, and proceeded onwards amidst the loyal acclamations of the assembled multitude. At Blackheath a large concourse of persons had assembled. Horses for her Majesty had been ordered to be ready at a quarter to 2, and soon after 1 o'clock many hundred persons had collected. The windows of the inn were filled by ladies from the neighbourhood, and there were about the Heath numbers of carriages and other vehicles. Her Majesty did not arrive until nearly half-past 2, and the horses having been changed, proceeded at a rapid pace towards town. The road from Blackheath, through Greenwich and Deptford towards New-cross, was lined with people of all classes, and the windows of the houses were crowded with females. Her Majesty was greeted as she passed with loud cheers. At New-cross, immediately below the station of the Railways, a fresh escort of the 8th Hussars were in waiting. Here also horses had been ordered, so that up to the time of her Majesty's arrival it was not known whether she would come by the road, or whether she would have taken the other route, by road to Ashford, and from thence by rail to New-cross. At a quarter to 3, the mounted police, preceding at some distance the royal carriages, announced to the escort the approach of her Majesty. They immediately formed, and a few moments afterwards the carriages arrived, and proceeded at a rapid pace towards town. The streets in the outskirts of the Metropolis through which her Majesty's route lay were completely lined with people, and the windows of the houses were also filled. Crowds of persons were collected at Peckham, Camberwell, and Kennington-common. At Kennington-oval, the children of the charity school were ranged in line on either side of the road, and along the Vauxhall-road, on Vauxhall-bridge, through Pimlico, Hyde-park, and the Edgeware-road, the usual demonstrations of loyalty were evinced; but to have caught a sight of her Majesty must have been impossible, from the rapid pace at which the carriages passed along. The distance from New-cross to the Paddington station of the Great Western Railway was traversed in half an hour. On arriving at the station, her Majesty and Prince Albert alighted, and proceeded to the waiting-room, followed by the attendants bearing the Prince of Wales and the Princess Royal. A special train had been provided, which started with the Royal party at half-past 3, and arrived in about half an hour at Slough. A detachment of Life-Guards was in waiting at the station, and the Royal party reached Windsor in perfect safety at 20 minutes past 4. Her Majesty appeared in excellent health and spirits, and very slightly fatigued by her lengthened journey. The loyal inhabitants of the town assembled in considerable numbers in the High-street, and on Castle-hill, to greet her Majesty upon her return from Kent.

Agricultural Districts.—We regret to record again this week the continuance of incendiary fires. In Lincolnshire two fires of this description have taken place in the fens on the property of the Duke of Bedford, by which rickyards to a large amount have been destroyed. In Nottinghamshire a barley and oat stack, belonging to Mr. Hill, of Griton, and a threshing machine of considerable value, the property of Mr. Rowe, were destroyed at Spalford on the 1st inst. In Cambridgeshire, on the 25th, a barn filled with wheat and oats was burnt to the ground on the farm of Mr. Frohock, at Burwell, near Newmarket; the lucifer matches by which the property was fired were found near the spot. A few days afterwards some out-buildings were fired at Swaffham, near the same place, on a farm belonging to Mr. Allix, M.P. In the Isle of Ely, two field barns and several stacks of corn on the farms of Messrs. Parnell and Mr. Hemmant were fired on the 24th. In Leicestershire, several stacks were burnt last week on the farm of Mr. Manning, of Bardon-park; in Berkshire, the premises of the Rev. A. B. Townsend, rector of Easthampstead, were fired, but the flames were discovered in time to prevent their extending to the rick-yard. In Essex, on Friday evening, a fire broke out on the farm of Mr. Bradbrook, on West Bergholt Heath, by which a barn filled with oats and unthreshed clover-seed was burnt to the ground. This is the third time these premises have been fired within the last few months.

Ashburton.—The Devonshire papers inform us that the good news from India and China has had the effect of reanimating the serge manufactories, which had been drooping for some time past. The extensive factories for serge in this town and neighbourhood were at full work last week; and the inhabitants are inspired with new life at the prospect of a revival of the export trade to the East.

Bristol.—At the meeting of the London Institute of British Architects on Monday, Professor Hosking read an account of the church of St. Mary Redcliffe, and of the recent survey of the fabric by himself and Mr. Britton, with an analysis of the reports and illustrations of the present condition and proposed restoration of the church. St. Mary Redcliffe is one of the finest parish churches in England, but has been allowed to become much dilapidated in parts, and, moreover, was never completed; so that a large sum is required to restore it to its original state, and perfect the design. Mr. Hosking considered the tower not merely the finest of its date, but the most beautiful architectural composition in his remembrance: in his opinion, much injury has been caused to the south wall of the church by sinking graves.

Cambridge.—A meeting of the Cambridge and Ely Board of Education took place last week, the Bishop of Ely in the chair. The report stated that the schools in the union were on the increase, and that the wish of the board was to see in every parish a daily and Sunday school conducted on the principles of the Church. It also stated that the training college for schoolmasters, at Chelsea, was capable of accommodating 60 pupils, with a school for the children of the neighbourhood, and a chapel; and that there is an establishment independently of this for 40 schoolmistresses. The report concluded by observing, that in recommending to general support institutions having the same aim as the board, they need only refer to the demoralised condition of some of our towns and villages. The Rev. Professor Whewell, Master of Trinity, and Vice-Chancellor of the University, expressed his gratification at the hopes held out of the establishment of commercial schools for the lower and middle classes, and the infusion into them of the religion of the National Church; he was glad to find that in most of the large and opulent towns of the country there was a spirit abroad tending to the establishment of such schools. He made a complimentary allusion to the new Collegiate Institution at Liverpool, and moved the adoption of the report, which was seconded by the Rev. Dr. French, Master of Jesus College. Dr. Haviland, Regius Professor of Divinity, praised the training system of the board as leading to a further extension of national education. No occupation, he said, required greater judgment and skill than that of a schoolmaster: his business was not merely to teach, but to educate; and it was his opinion, also, that more skill was necessary to educate the poor than the rich, as the latter were prepared at home for the education they were to receive at school, where a polish only is to be given as to a diamond ready cut, whereas the former have to be cut and polished both. The meeting was addressed subsequently by the Rev. Dr. Graham, Master of Christ's College—Rev. Dr. Webb, Master of Clare Hall—Professor Corrie, and numerous other gentlemen, who bore testimony to the value of the board, and to the important results which it promises to produce in the middle classes of society.

Derby.—We have often adverted to the efforts made in various parts of the country for the restoration of church antiquities. This week, we learn by the local Papers that the embellishment of a church has been adopted as a more desirable testimonial to the clergyman than the old practice of presenting a piece of plate. It appears that the Duke of Devonshire, the Earl of Burlington, the Hon. G. H. Cavendish, M.P., and Mr. W. Evans, M.P., have headed a subscription to have a stained glass window placed over the communion table of the Rev. Thomas Hill's church at Derby, as a testimonial of the esteem entertained by the inhabitants and local nobility and gentry towards the Rev. Gentleman. This is a change in the right direction: at Chichester, the example of the Dean in erecting an obituary window to the memory of his sister has been followed by other gentlemen; and there can hardly be a doubt that the instance now recorded at Derby will prove more gratifying to the clergy than any testimonial estimated by its mere money value to the party concerned.

Dover.—An experimental floating breakwater, constructed by Capt. Groves, late of the Rifles, was moored on Tuesday in Dover Bay, in seven fathoms water. It is an iron cylinder, resembling the funnel of a steamer, fifty feet long, eight feet in diameter, and riding about four feet out of the water, nearly a third of a mile from the pier. A spar, twenty feet high, with a red flag and a bell, will will be attached to it. It is moored by four immense anchors, and is expected to cover the entrance of the harbour, so as to make it accessible in stormy weather. The anchors and chains were supplied by the Admiralty, who have rendered every assistance in carrying out the experiment.

Gloucester.—At the recent dinner of the Gloucester Agricultural Society, the principal speeches were those of Earl Ducie and Mr. Bowley, of Seddington, near Cirencester. Mr. Bowley, who had been the winner of one of the premiums, said—"He was happy to congratulate the meeting on the increasing prosperity of the society; but he regretted that he could not at the same time congratulate them on the increasing prosperity in the prospects of the farmer. A noble lord in a neighbouring country was reported to have said that farmers must exert themselves; that they must not stand idle by when their cart is in a hole, and call upon Jupiter for help. He quite agreed with the noble lord that it would be useless to call upon Jupiter; but if times should continue bad, there was another power which the farmer has some sort of right to call upon, and that is the landlord. If he will place his shoulder at one wheel, which it is his duty to do, get his landlord to put his shoulder to the other, and put his labourer in the shafts, he will soon get over his difficulty; but without that kind of union (and it was no use to mince the matter) the farmer could not stand. He believed from all that he knew of the landlords of this country, that they will readily respond to the call."—Earl Ducie said—"Agricultural produce was rather lower now than it had been—he believed it was at its lowest. He saw no reason why it should be so low, and he believed there would be a reaction. It was impossible for farmers to employ labour as they would do, or as they could do, if they had not a permanent interest in their land. He was quite sure there was no farmer in that room who could put his hand on his heart, and say that if he had a permanent interest in his land he would not employ more labour on his farm than he felt justified in doing, considering the present price of things. Nothing better proved the advantage of good cultivation of land than the condition of the poor in those parishes where good cultivation existed. Wherever good cultivation was general, there they would invariably find that poor-rates were lowest. He was quite satisfied that it was not only to the advantage of the poor and the interest of the farmer that this should be so, but that it was the interest of the landlord also. If landlords knew their best interest, it would be that of having a thriving tenantry; while nothing injured an estate so much as having a tenantry working up hill. And for the farmer, it must be far better to pay his labourers wages for working on his farm than to maintain them out of the poor-rates."

Leeds.—The Anti-Corn-Law-League fund has made some progress in this manufacturing district. In Huddersfield the sum of 1,170*l.* had been subscribed at the date of the last report; and in Halifax, on the evening of the meeting and the next day, 540*l.* was subscribed. A demonstration in favour of the League took place in this town on Tuesday, at a tea-meeting, which was attended by about 500 persons. Mr. Marshall, a Leeds mill-owner, presided, and was supported by Mr. Cobden, M.P.; Mr. Aldam, M.P.; Mr. Busfeild, M.P.; Dr. Bowring, M.P.; Colonel Thompson, and most of the leading opponents of the corn-laws in Leeds. Several speeches were delivered, and a series of resolutions was entered into, in reference to the operations and purposes of the League. A subscription was then commenced, and at the close of the meeting the chairman announced that the sum received amounted to 745*l.*—We are sorry to find by the local papers that Dr. Nixon, the Bishop of Tasmania, has been confined to his bed at the vicarage in this town by an attack of fever; the last accounts mention that he is going on favourably, and will soon be able to resume his official duties.

Leicester.—The annual meeting of the Leicestershire Agricultural Society took place on Friday last, and was more numerously attended than on any former occasion. About 200 persons sat down to dinner, the Duke of Rutland in the chair, supported by Earl Howe, Lord Curzon, &c. In returning thanks to the meeting for drinking his health, his grace adverted to the changes that had taken place in the laws affecting the importation of cattle and corn. He should not now express any opinion upon those alterations, as he had not formed any conclusions upon the subject. He would, however, state that growers of corn had admitted that the duty might be safely lowered. He had several letters in his possession written by parties fully able to judge on the probable effects of any change in the Corn Laws, &c., enclosing schedules of various scales of duty, many of which clearly showed that even the present modified scale might be reduced by some shillings per quarter. In regard to meat, he could positively state that the tariff had acted very prejudicially on farming produce, as the agriculturists had so alarmed themselves when the bill was first introduced that they sent their stock to market two months before the time they otherwise would have done, and, consequently, the beasts, not being in proper condition, did not fetch the value that the farmer ought to have received; he would show them, from a statistical return, the quantity of meat and number of beasts imported to this country from the 9th of July to the 5th of November—viz., cattle, 2,273; cows, 941; calves, 73; sheep, 608; lambs, 10; swine, 301. Fresh beef, 41cwt. 2qrs. 10lb.; salted beef, 2,512cwt. 3qrs. 27lb. salted pork, 7,158cwt. 3qrs. 5lb. Exported as ships' stores:—Salted beef, 5,777cwt.; salted pork, 426cwt. From a calculation of the beasts sold in Smithfield-market for the seven years ending in 1839, he found that the average per year was 162,260, or 3,120 weekly; in the three months succeeding the passing of the tariff the importation did not exceed 3,016, being rather less than one week's consumption; it was evident, therefore, that the farmers and graziers had unnecessarily alarmed themselves. At the suggestion of the President of the Royal Agricultural Society, he put two acres of land under an experiment: the first he sowed with nine pecks of corn, from which a produce of five quarters two bushels was raised; upon the second acre he sowed fourteen pecks, and obtained five quarters and six bushels therefrom. He hoped that the present depression would not lead to a reduction in wages to the labourer or artisan. It was his opinion thot the more labour was employed upon a farm, the greater was the return to the occupants.

Liverpool.—Considerable sensation was created in this town on Friday last, by a report that a man of colour, the cook of the bark Clydesdale, of Greenock, had been strangled to death by the chief mate and four seamen of that vessel, which arrived in port from Bombay on the preceding night. This sensation was augmented after the police had boarded the vessel and ascertained that there was foundation for the rumour. It appeared that the deceased, a native of Jamaica, had been ill for some days and confined to the forecastle, when the chief mate charged him with skulking from his duty, and ordered him to be hoisted out. A rope was accordingly fastened round his neck, by which the crew dragged him out of his hammock by main force. He lay for a moment extended upon a chest, when the carpenter, who had been roused from sleep by the noise, rushed from his berth and called out to the parties on deck to desist, as they were choking the man. The rope having accordingly been slackened, the carpenter slipped it off the neck and fastened it round the body of deceased, and in this manner the latter was hoisted upon deck, where he was placed and kept in a recumbent posture for about two hours; but he never spoke during that time, and was evidently dead when first brought up. These are the main facts of the case, which have been reported at great length in the daily papers. After a full inquiry, the magistrate committed the four prisoners on the charge of murder on the high seas. The trial will take place at the next sessions of the Central Criminal Court.—A collision on the Mersey took place last week, between the steamers Prince of Wales, on her voyage to Cork, and the Royal Victoria, from Carlisle. One man was killed at the moment of the collision, and four others are now in the hospital in a dangerous state. An inquest has been held, but the evidence was of the most contradictory kind. It appears to be the general rule laid down by the Trinity Board, that when two vessels are coming towards each other from opposite directions, each of them must port the helm, by which they would be enabled to pass each other and avoid collision. Upon this point the evidence of course was principally directed; and it seems to be the general opinion that the Victoria did not attend to these instructions, and thus caused the collision. At the close of the preliminary inquiry, the Coroner adjourned the inquest until Monday, the 12th inst., in order that he might communicate with Sir J. Graham in the mean time, and thus ascertain whether the Mersey was to be considered within the borough of Liverpool, and whether his jurisdiction extended to that part of the river where the cause of death had occurred. He said that since the late decision of Lord Denman on the subject of Coroners' jurisdiction in the case of railway accidents, it became the more necessary to have the question clearly set at rest before they proceeded further.—The subscriptions to the League Fund on Saturday night amounted, it is said, to 1,500*l.*

Ludlow.—The inhabitants of this part of Salop were painfully surprised on Friday week, by the melancholy death of Mr. Temple Best, of Stepple Hall, who was drowned in the river Lea on the preceding night. The unfortunate gentleman was returning home on horseback from a party at the Rev. A. Woodward's, of Neen Savage, and is supposed to have been carried away by the current in crossing the ford, as the river was much swollen at the time from the late snow and heavy rains.

Manchester.—The recent news from China has given fresh life to our spinners and manufacturers. A large mill, in the vicinity of this town, which cost the proprietor 120,000*l.* after standing still for three or four years, has this week been taken, with the view to commence working it without delay. It will require about 1,000 hands in the various departments, and is sure to be beneficial to the labouring classes. So great has been the depression of this kind of property, that the whole of this establishment, with excellent machinery, was conveyed to the mortgagee for the small sum of 28,000*l.*—not one-fourth of its original cost.—The council of the Anti-Corn-Law League is about to erect a building for its public meetings, as there are none in Manchester sufficiently commodious for that purpose. The site has been given by Mr. Cobden, M.P., and is situate in Peterloo. It will be fifty yards long, and is to be completed in order that the League may hold in it their intended great meeting before the opening of Parliament.

Northleach.—The Cheltenham *Examiner* states that a man named Sparrow, who was committed to Northleach prison for one month, for entering a shop with a felonious intent, was on the way to the prison in custody of a policeman, when he pretended to do something to his shoe, and slipped his leg under a waggon that was passing, in order that he might be taken to an hospital instead of the prison. His leg was of course broken, and the prisoner was conveyed to the Cheltenham Hospital.

Oxford.—A convocation was held on Thursday week, when it was agreed, with one dissentient, to accept the legacy of 10,000*l.* bequeathed by the late Dr. Ireland, Dean of Westminster, to the University, the dividends to be applied for the benefit of a professor, whose department shall be "Exegesis of Holy Scripture." The appointment of the professor to be by the Heads of Colleges and Halls.—Last week, as the Rev. Mr. Bathurst was delivering his customary Wednesday evening lecture at St. Giles's Church, his bands caught fire at the candle lighted at the side of the pulpit. His face was immediately enveloped in flames, which were not extinguished until the neckcloth had also caught fire. His head and face were severely burnt. The congregation were much alarmed by the occurrence; several persons fainted; and the service was of course suspended.

Portsmouth.—We learn by the *Hampshire Telegraph* that a Court-martial is ordered to be held, to try the Hon. Capt. Elliot, commanding her Majesty's ship Spartan, in the West Indies, for having corporally punished Mr. Gleig, son of the Rev. G. R. Gleig, of Chelsea College, doing duty in that ship as a midshipman. The affair has caused some sensation in the service, and has been brought prominently before the public by some of the naval papers; but as the real facts of the case will probably not be known until this inquiry be concluded, it would be premature to repeat any of the rumours in circulation.

Salisbury.—A melancholy accident happened on Thursday week, at East Grafton, near this city. The Rev. Geo. Montgomery, Earl Bruce, and the Rev. Mr. Ward, his nephew, had left Wilton House for the purpose of inspecting the church now erecting at that place at his lordship's expense. They were standing in the building, when a portion of the stone vault of the eastern nave fell and killed Mr. Montgomery on the spot. The architect, the contractor, and other persons who were in the church at the time, escaped unhurt. The vault would have been perfectly secure if the mason had not neglected to wedge up the centreing. The jury at the inquest returned a verdict of "Accidental death."

Stafford.—We copied from the daily papers on the 26th ult. an announcement under this head, on the authority of the *Stafford Examiner*, stating that Lord Hatherton had been accidentally wounded while shooting. We are happy to find that at the time of the alleged injury his lordship had left Teddesley for town for a few days, no such accident having occurred.

St. Asaph.—A new English church was consecrated at Llanrwst, on the 28th ult., by the Bishop of the diocese. It has been built by voluntary subscription, on land presented by Lord Willoughby D'Eresby. The necessary endowment for the minister, repairs, and the general purposes of the church, have been granted by the Rev. H. Edwards, the former rector, who had previously contributed to the parish the sum of 4,000*l.* The new church stands on an ascent at the entrance of the town from Pentrevoelas, commanding a full view of the valley, and forming an interesting object from all parts of that beautiful district of North Wales.

Stockport.—The Cheshire papers mention with satisfaction that parties are in treaty for the Mersey mills, and the Higher Hillgate mills in this town, with a view of commencing work. Both these establishments, although filled with machinery have been closed many months, the former having been last worked by Mr. Carr, and the latter by Messrs. Lanes, who jointly employed nearly 2,000 hands. The re-opening of these mills, would find employment for a large number of destitute operatives, and relieve the long continued distress of the town. It is also said that arrangements are in progress for re-opening the extensive cotton manufactory ar Gorton, in this neighbourhood.

Wakefield.—A numerous meeting of gentlemen who have interested themselves in promoting the public testimonial to Lord Morpeth was held here last week, when it was determined that the presentation should take place early in the ensuing year, at Castle Howard. The subscriptions amount to 4,000*l.*

Yeovil.—The annual meeting of the Yeovil Agricultural Society took place on Friday, and was very numerously attended. The cattle show was superior to the exhibition of last year, but hardly equal to that of some former occasions. The dinner in the evening was the great feature of the meeting, and has excited much interest among the agriculturists of Somersetshire; Mr. W. Pinney, of Lyme, presided. The proceedings and the speeches are reported at great length in the daily papers, but the following is a summary of the most interesting portion, abridged from the Dorset *County Chronicle*:—The Conservative members for the county, Mr. Acland and Mr. Dickinson, having been proposed, both these gentlemen addressed the meeting. Mr. Acland said that he had advisedly supported the Government in their late measures, from the conviction that in these times no class of the community ought to wish or expect to have such protection as was injurious to other classes and to the general interests of the country; and it was his opinion that all these questions should be met with great consideration and with moderation by all parties. In regard to the glove-trade, in which Yeovil was particularly concerned, he was glad that Ministers had conceded the alterations in the scale of duties originally proposed. He was glad that this had been accomplished, because it affected a very large body of his poorer constituents, who had been benefited by the change; but he would observe, that they must not rely too much upon the Legislature for what was called protection against foreign competition, for the time was come when the best security for all interests was in increased intelligence and perseverance, so that they might produce the best articles at the lowest rate. This might be taken to apply alike to agriculture and to manufactures, for these were not times when any class could safely rest upon their oars; but all must endeavour, if they would withstand foreign competition, to produce the best article at the lowest price. He hoped that whatever changes had taken place, or might take place, though he did not know of any further changes in contemplation, they would, looking to the balance of interests, work for the good of all. Mr. Dickinson said that he considered himself the representative, not of local interests, but of all England, and he had felt it his duty in supporting the Government measures to take an independent course. At a later period of the evening he recurred to the subject, and said, "With respect to gloves or other articles, you must not rely upon legislative measures for prohibiting the importation of foreign produce. The course of things at present is against protection, and in favour of free trade, and I do not think it can be stopped; but if we cannot stem the tide, we must endeavour to assist each other by adopting improvements and all means tending to our mutual benefits. I for one have not such apprehension for the future, for we are a great people, with vast resources, and I do not think we shall suffer from any trifling alteration in the laws. We are a great people, and not an artificial people, and I do not think we can much longer continue artificial means or laws for keeping up any particular interest." Mr. Sanford, the late Liberal member for the county, then addressed the meeting at great length: he said he had no doubt that his hon. friends, their representatives, had taken a conscientious course, and had done what they believed to be best for the country; nor did he doubt that, had they before seen cause for entertaining the opinions they had now expressed, they would have manfully avowed those opinions. He was not disappointed at what had taken place, nor at what had fallen from his friends; he expected this change, but he must say it had come a little sooner than he expected it. He now came among them as an independent man, having no responsibility upon him as a public character, and, as such, he would say to them, "Place no reliance on any protection whatever; I will say again place no dependence on any legislative protection, but trust more to yourselves, for if you trust to protection for the future, you will, I am firmly persuaded, trust to a reed that will bruise yon." This remark, delivered with considerable energy and warmth, caused a great sensation in the meeting, and Mr. Sanford was loudly cheered. "I hope," he said, "I have not said anything too strongly savouring of politics, but I feel that I ought to express to you my honest convictions; and as one wholly dependent upon agriculture for all I possess, I have only said to you what I would say to my own tenants were I sitting with them at my own table." He then proceeded to address the meeting upon purely agricultural subjects, and strongly recommended draining, with long leases. It had been said that draining was the landlord's work; he did not altogether agree with that, and would ask if it would not be much better done by the tenant, who should have a long lease to counterbalance the outlay? Mr. Moody, the President-elect, followed at some length, in a speech which was received with much enthusiasm. If, he said, they were not to look to that protection to which they considered they were fairly entitled, were they to sit down and do nothing to enable them to maintain their position, and to uphold that independence and integrity which the yeomanry of this county, and he believed of all England, had so long been distinguished for? What, then, were they to look to? They were to look to that which could not slip through their hands—to the increased productiveness of the soil, which was only to be effected by improved husbandry, by calling in the aid of chemistry, and by using the most portable, best, and cheapest manure. They had no premiums for improving the land, and if they would allow him, he would offer a prize for the person who should, on the largest scale, experimentalise with the greatest variety of manures. Several other speeches followed, but their interest was chiefly local.

Railways.—The returns made of the traffic for the week, by the leading railway companies, are as follows:—Midland Counties, 2,143*l.*; Birmingham, 12,905*l.*; South-Western, 4,939*l.*; North Midland, 3,529*l.*; Great North of England, 1,224*l.*; Grand Junction, 6,378*l.*; Blackwall, 466*l.*; Edinburgh and Glasgow, 1,649*l.*; Birmingham and Gloucester, 1,575*l.*; Croydon, 194*l.*; Hull and Selby, 911*l.*; Eastern Counties, 785*l.*; Birmingham and Derby, 1,134*l.*; Northern and Eastern, 989*l.*; Greenwich, 683*l.*; Great Western, 10,095*l.*; Brighton, 2,663*l.*—The half-yearly meeting of the South-Eastern Company was held on Friday, Mr. Baxendale in the chair, and was very numerously attended. The report stated that since the last general meeting the opening of the line to Headcorn and Ashford had given the directors an opportunity of lowering the fares, and of placing on the line a third-class traffic, which had tended to increase the company's profits. No accident whatever had yet occurred upon the line, and though delays from want of funds had taken place in the earlier stages of the undertaking, those impediments were now entirely removed. A further portion of the line would be opened to Folkstone in July next, and the whole distance to Dover by the end of the year. The subject of the proposed branches to Maidstone, Canterbury, and other places had not been lost sight of; indeed, the board had reason to expect the construction, in time, of many tributary lines. The chairman congratulated the proprietors on the good prospects of the undertaking, and referred to the present mode of working the three lines which traverse the South Eastern Counties. He described it as the height of imbecility to suppose that the present system of management of these companies, including the Brighton and Croydon, could work beneficially for each other with different directors, different engineers, and different stations. He thought that, sooner or later, an amalgamation of interests must take place. Till that was the case, he said the minor consideration of pounds, shillings, and pence, would have no effect. The existence of one undertaking for the whole traffic of those counties would suffice. The total payments had been 2,187,000*l.*, and the further expenditure required by the statement of Mr. Cubitt was 596,000*l.* Resolutions were carried, empowering the directors to issue loan notes for 220,000*l.*, at a rate of interest not exceeding 5 per cent.; also to apply to Parliament next session for powers to extend the line, to form a station and depot from Archcliff Fort to the South Pier, Dover, and to make a West End Station in conjunction with the Croydon Railway, near the Bricklayers' Arms.—On Tuesday week an attempt was made to throw the London Mail train off the Birkenhead Railway. It was on its way from Birkenhead to Chester, when it came in contact with a beam of wood, nine feet long, placed diagonally in the ground so as to strike the engine. The concussion was severe, but no injury occurred beyond some slight damage to the machinery, which did not prevent the train from proceeding to its destination.—A serious accident occurred on Thursday on the London and Birmingham Railway, which has been attended with loss of life. It occurred about half-way between the Tring and Berkhamstead stations, while the train was proceeding at the rate of 30 miles an hour, and was caused by the breaking of the axle of the engine. The near wheel was next broken, and the engine turned completely round, and was shattered to pieces, no portion of it remaining entire but the cylinder, which was driven by the concussion to a distance of thirty yards. The stoker was taken up speechless, but the engineer escaped with a slight hurt on the foot; three passengers in the first carriage were seriously wounded, one has since died; but all the first-class passengers escaped without injury. The official account states that on an examination of the fractured axle, it appears that the iron, with the exception of a very small portion, is defective, although not externally apparent, and that the separation is so close to the wheel that at first view it would seem to have been made by a knife. The circumstances of the accident will be reported to the Board of Trade, for investigation by General Pasley.

IRELAND.

Dublin.—A meeting of the Bishops of the Established Church was convened by the Lord Primate last week, for the purpose of laying before their lordships a communication received from Sir R. Peel, respecting an application which had been made to Government on behalf of the Church Education Society for a portion of the grant now applied by Parliament to the system of national education. The reply of Sir R. Peel stated that her Majesty's Government, having given to the question of education in Ireland very mature deliberation, have resolved to recommend to Parliament the continuance of the Parliamentary grant for the purpose of education on the general principles on which that grant has heretofore been made; and that they have further resolved not to propose a separate vote for the Church Education Society. It is said that this decision was not altogether unexpected by their lordships; and another meeting took place on Friday last, when an address was drawn up, to the branch secretaries of the Church Education Society, deploring the policy which the Government has thought fit to adopt, and entreating them to use renewed exertions on behalf of the parent society, as henceforward it must be on their own resources alone they can depend. This document, which is written in a temperate and conciliatory spirit, expresses the persuasion of the bishops that the maintenance of their schools is of essential service to the interests of religion in Ireland. It is signed by the Lord Primate and all the other prelates, except the Archbishop of Dublin and the Bishop of Derry; the Bishops of Tuam and of Limerick are out of the country, and were therefore not consulted.—The decision of the Court of Delegates in regard to the Deanery of St. Patrick's was to have been given on Monday, but it has been again postponed. On the opening of the court, Mr. Justice Crampton announced that the delegates were unable to come to an agreement on one very material point, namely, the right of the Rev. Dr. Todd to vote at the election as a member of the Chapter of St. Patrick; and that they considered it necessary to hear counsel upon the question: the court would, therefore, adjourn to Wednesday for that purpose. It is rumoured that the delegates have made up their minds on the question raised as to the validity of the vote of the Archbishop of Dublin. The Archbishop and Dr. Todd tendered their votes for the appellant, but both were rejected, and the Rev. Dr. Daly being thus in a majority, was declared duly elected. The question before the court is narrowed to the single point of the validity of these two votes. The revenues of the deanery amount to upwards of 2,000*l.* per annum; and it is stated that the vacant see of Cashel will not be filled up until this appeal be decided.—The Dublin papers mention that Father Mathew is about to visit Guernsey and Jersey, by invitation, immediately after Easter.

Kilkenny.—We had scarcely recorded in our last number, the melancholy fate of Mr. Scully, when intelligence arrived of another atrocity, scarcely less distressing in its details. The present murder occurred on the 29th, at Freshford in this county, a neighbourhood which had not previously been disturbed. It appears that Mr. Mortimer, the agent or middleman of Mr. Browne, of Regent's Park, London, had ejected and removed some tenants, and was about to remove others. He had gone to Freshford in the morning, and was walking to his house, when in passing the gate of the Roman Catholic Chapel, he was knocked down by two men, who literally beat his head to pieces. The chapel is in the middle of the town, which contains two thousand inhabitants and two police stations, and yet this murder was committed in the open street at five o'clock in the afternoon. A man living in the neighbourhood saw the transaction, and did all in his power to secure the murderers, but without effect. The police also pursued them, but nothing was found except a stick with an iron fork, the prongs of which had been broken off; it was covered with hair and blood, and had evidently been thrown away by the murderers when they were flying from the town. The Lord Lieutenant has issued a proclamation, offering a reward of 80*l.* for such information as may lead to the apprehension of the criminals, within six months from the present time. The attack, it is supposed, arose out of contentions between Mr. Mortimer and the sub-tenants. The rents on the land are said to be very high, and the life of Mr. Mortimer was the last in the lease between the middleman and the landlord.

Tipperary.—Another mysterious murder is reported by the Journals of this week, in the northern district of this county. On the 30th ult., about seven in the evening, a man came to the house of Michael Hanly, of Greenhall, and asked the way to a neighbouring townland. Hanly and his wife were sitting at the fire at the time, and the latter said she did not know where it was, but the husband stood up and approached the door, when the stranger advanced a few paces, presented a gun, and fired at him. Hanly staggered to the fire and fell to the ground, crying that he was killed. The man stood for a moment at the door, watching the motions of his victim, before he departed. The wife rushed out to a house near at hand, but that also was fired at. The deceased met his death on account of his having taken some land from which a party of refractory tenants had been ejected. Government have offered a reward of 100*l.* for information which may lead to the apprehension of the criminal.

SCOTLAND.

Edinburgh.—The two series of resolutions entered into by the Non-Intrusion Convocation, on the 19th ult., have been published this week. The first series was supported by 427 ministers, and the second by 354 ministers; their substance was clearly stated by Dr. Candlish in the address quoted in our last, and it is therefore unnecessary to repeat them, or enter further into their details. They affirm that the church is not only essentially independent of the civil magistrate in her spiritual province, but is not bound, and is not at liberty to conform her proceedings in the government of church matters to the orders of the state, or of any courts of the state, against her convictions of duty. They conclude by avowing the intention of the Convocation to quit the Establishment if the legislature does not agree to some compromise. "It is," they say, "the determination of the brethren now assembled, if no measure, such as they have declared to be indispensable, be granted, to tender the resignation of those civil advantages, which they can no longer hold in consistency with the free and full exercise of their spiritual functions, and to cast themselves on such provision as God in his providence may afford, maintaining still uncompromised the principle of a right scriptural connexion between the church and the state, and solemnly entering their protest against the judgments of which they complain, as, in their decided opinion, altogether contrary to what has ever hitherto been understood to be the law and constitution of the country."

Glasgow.—As one of many instances of the improvement of business in this town consequent on the peace with China, one house, which had done little business for months, last week closed a contract of 10,000*l.* in power-loom goods for the China market: these will still have to go through the printing process at home, so that they will afford some work to the distressed operatives.—A subscription is in progress among the friends of the late Mr. Kirkman Finlay, for the purpose of erecting a marble statue of that gentleman. Upwards of 600*l.* has been already subscribed, but it is proposed to increase the amount to 1,000*l.*, in order that a suitable work of art may be obtained. The statue will be placed in the new Merchants' Hall.

Miscellaneous.

The Affghan Prisoners.—The following interesting letter, giving an account of the escape from Bameean, has been published in the *Delhi Gazette.* It is written by one of the prisoners, the officer who first endeavoured to negotiate with Salih Mahomed for their escape:—"Camp, Cabool, Sept. 22, 1842.—I am sure you will be delighted to hear of not only myself, but the whole of us unfortunate prisoners (with the exception of Bygrave) being once more under the protection of the British flag, after a captivity of eight months and a half. On the morning of the 25th ult. (August) we suddenly received an order from Mahomed Akhbar Khan to prepare for our immediate departure towards Toorkistan. We started at 10 p.m., Troup and Bygrave remaining with the Sirdar, and Mrs. Trevor and family, Anderson, Mrs. Anderson and children, and Dr. Campbell, in consequence of the illness of the ladies; our escort consisted of three hundred infantry, under the command of Salih Mahomed Khan, formerly a subadar in our friend Hopkins's corps, and who deserted to Dost Mahomed, at Bameean, in September, 1840. We arrived at Bameean, on the Toorkistan frontier, on the 3d instant. During the march, as Salih Mahomed and I had become rather intimate, on the morning of the 29th August, I privately proposed to him that if he would forsake Mahomed Akhbar, and carry us off through the mountains in the direction of Nott's force, which we heard was near Ghuznee, and make us over to the General, we would give him a lac of rupees. At that time he appeared to think it very doubtful which party would gain the day, and laughingly said, such a thing was, if not an impossibility, at least a matter of great difficulty. As I had some doubts of the man's inclination to serve us, I thought it was advisable to leave him to digest what I had mentioned until a more favourable opportunity offered. The next day Lawrence, to whom I had mentioned my proposition, again spoke to our commandant regarding the lac of rupees. At Bameean our whole party was put into two forts, in the most miserable, dirty hovels you ever saw; the officers, ladies, and children into one, and the European soldiers into another. Our situation, as you may imagine, was not enviable, having nothing but a prospect of slavery and a dungeon as our fate in Toorkistan, Mahomed Akhbar having declared before we left Cabool that he would distribute us amongst the various Tartar chiefs in the event of our troops marching on the capital. On the 10th (September) we heard of Ghuznee being destroyed by Nott's army. On the 11th we heard to our horror that the order had arrived during the night for our immediate departure to Kooloom. Shortly afterwards I received a message from Salih Mahomed Khan that he wished to see Lawrence, Pottinger, and myself, in a private conference. I very soon obeyed the summons, having an inkling that it had reference to my former offer of a lac of rupees. When we were assembled, our commandant told us that an order had come from the Sirdar for our instant march to Kooloom, and produced the letter, which stated that we were to be moved over to the Walee, or chief, and that all orders regarding us must be obeyed; he then went on to state that Synd Moorteza Khan, who was formerly employed by me during the siege, had brought him a message from Moonshee Mohunlall, that on condition of his releasing us and bringing us into Cabool, he would receive from General Pollock 20,000 rupees and 1,000 rupees per month for life. Salih Mahomed said—"I know nothing of General Pollock, but if you three will sign a paper guaranteeing to me this sum, I will join your interests heart and soul." To make assurance doubly sure, as regarded the sum to be given to Salih Mahomed, in the event of Government not agreeing to aid us in effecting our release, we three were formed into a committee, obtained the sanction of every officer and lady to give such sum as we might hereafter demand of them for the proposed object, acting to the best of our ability to effect our own release. We told Salih Mahomed to draw out an agreement, which he did, and we bound ourselves on the part of every lady and gentleman to give the commandant 20,000 rupees, and 1,000 rupees per month, and subsequently added four months' pay to each sepoy on condition of their taking us into Cabool. We had now fairly committed ourselves, as we knew that in the event of our hereafter falling into the Sirdar's hands, through treachery or otherwise, the lives of us who had signed the paper (I ought also to have mentioned Mackenzie's name, as he also attached his signature) would pay the penalty. On the morning of the 12th Salih Mahomed's flag of defiance was hoisted on one of the towers of our fort; he wanted money to pay his troops; some kafilas coming in at the time from Toorkistan, he levied a tax on them. The Governor not bringing himself forward in assisting us, he deposed him, and put up another. The man who had civil charge of us, Ahmed Khan, received an intimation that neither he nor his 100 soldiers were required any longer, and that they would be seized if they delayed their departure. On the 13th those agents had all taken their departure; on the night of the 13th I went outside of the fort, when everything was quiet, and brought the water from a cut near at hand into the ditch at the back of the fort, as, in the event of a siege, which we hourly expected, as we imagined our troops must be somewhere near Cabool, the Sirdar would for a certainty bolt in our direction; the river being at some short distance off, our water might be cut off. On the 14th all the principal chiefs came in to make their obeisance to us, and tendered every kind of aid. We all subscribed such small sums as we could afford to lay in a little godown of our own, and I undertook this part of the work with about 5,000 rupees, which I had collected; on the 15th it was thought advisable to send three or four officers into the soldiers' fort, as we had been promised muskets for them, and my mess, consisting of Burnett, Alston, Crawford, and self, removed our beddings there, and took military and political charge. We dug wells, filled the ditch, repaired the holes, and were all busy as bees. When we heard of Mahomed Akhbar's defeat at Tezeen, all our preparations for a siege were stopped, and we determined to force our way to Cabool with our small guard, and to effect our release solely through our own exertions. On the morning of the 16th we took our departure, and halted about ten miles off; on the 17th crossed the Kaloo mountains, 13,000 feet high, and halted near Kharzar, where we were met by the 610 Kuzzilbash horsemen who had come to our aid, under the command of Sir Richmond Shakespeare. On the 19th we were met on the road by General Sale, with 1,000 cavalry, 1,000 infantry and two guns, who had the day before come out to our assistance from Cabool, and thanked God that we once more breathed the air of freedom. I was anxious to push on to Cabool, and started again in the evening with two of my Kuzzilbash friends to Kila Kazee, where General Nott's force was encamped, stopped the night with my friend Dr. Mackinnon, and came on here on the morning of the 21st, and took up my quarters with my old shipmate Burn. Yesterday morning all the prisoners came into camp, when there was a Royal salute fired, and here we all are, as happy as men and women can be who but a few days ago had scarcely a hope of any other fate than the dragging on a miserable existence in some dungeon in Toorkistan. Mahomed Akhbar had sent orders to put to death all those who were too weak to proceed to Kooloom."

American Antiquities.—A Correspondent of the *Morning Chronicle* at Philadelphia has addressed a letter to that Journal by the packet just arrived at Liverpool, from which we extract the following passage:—"A new work is about to be published here, which will throw additional light on the wonderful antiquities of Central America. It is from the pen of Mr. Norman, who has just returned from that region, having gone farther and examined more closely than any previous traveller. He describes the ruined city of Chi-Cheu, among the stupendous monuments of which—temples, pyramids, houses, and palaces—he wandered for five days. The Indians regarded him with astonishment; but they had among them no tradition, no suspicion even, as to who were the people that inhabited that now silent city. There are the ruins of a temple 450 feet long—a pyramid 120 feet high—columns innumerable, strewn about or still standing; architecture vast and superb in its character; and all in hewn stone, with ornaments and style resembling those of ancient Egypt; and now and then modern wild Indians. Mr. Norman says it must have been one of the largest cities in the world."

Law.

COURT OF EXCHEQUER.—*Smith* v. *Bond.*—This was an action to recover from the defendant, under the statute of Anne, certain moneys unlawfully won by him at the game of hazard. The trial caused considerable interest in fashionable circles, and the court was densely crowded. Mr. Thesiger, in stating the case for the plaintiff, said that the present action had been brought under an act which had been passed in the reign of Queen Anne, with the intention of endeavouring to prevent the vices arising from excessive gambling. The act provided that, where a person should, at any one sitting, lose more than 10*l.*, it should be competent in him, within three months of such loss, to recover the same from the party by whom it had been won, with penalties amounting to treble the sum so lost; and further, that in the event of such person not adopting that step, the statute went on to say, that any person should have the right to sue for the said penalties; and that, in the event of his gaining a verdict, he was to be entitled to one moiety of the amount recovered, whilst the other moiety should be paid to the parish wherein the offence had been committed. It was, therefore, under that statute that the present action had been brought. In bringing such a case as this before the jury, he was fully aware of the difficulties he should have to contend with, from the indisposition, on the part of many persons, to place credit in the evidence of individuals who were associated with what was denominated the "play" world; but he conceived that, in the present instance, the statements of the witnesses would prove to be so clear, and be so well corroborated, as that they would at once, of themselves, remove all apprehension of difficulty on that head, and lead to the perfect establishment of his charge, that the defendant had been guilty of the offences set forth in the declaration. It appeared that the defendant had for many years been the owner of a house which, strictly speaking in the eye of the law, was a common gaming-house, situate in the parish of St. James's; that he was the rated occupier of the house, and that there had been many persons therein who not only lost their money, but others who had seen that money paid to the defendant himself. The principal witness was a man named Benjamin Thompson, who had been in defendant's employ; he deposed to the fact of various losses sustained by different noblemen and others, and stated that the money was paid either in cash, or by draft, into the hands of defendant, or to his bankers on his account. Other witnesses were called to prove the amount of their respective losses, and the payment of the drafts. In the defence, it was argued by Mr. Platt, that a draft was not money, and that some of the drafts had been paid in the city and not in the parish in which they had been won. He contended, therefore, that the action could not be maintained, for he would submit that it was manifestly clear that the offence the Act of Parliament had contemplated was not the mere act of playing and winning, but that the offence must be completed by the absolute payment of the money so won; and it was only in default of action within a certain period by the loser, that another party was entitled to step in and sue. He should therefore submit, that in order to complete the offence, proof must be given that the money had not simply been won, but that it had been actually paid in the parish wherein it was alleged to have been won. He denounced the action as arising out of an attempt to effect a compromise, and threw doubts on the credibility of the principal witness. Lord Abinger said, that as to the counts which charged money to have been won of the Marquis Conyngham, Lord Cantalupe, and Mr. Fitzroy Stanhope—on those counts there had been no proof of payment, and, therefore, the verdict with respect to them must be for the defendant. Mr. Platt said that would be the proceeding as a matter of course, and upon that point the jury would have to find in accordance with the direction of his Lordship. Lord Abinger then summed up the case. The object, said his Lordship, of the statute of Anne had been to put down the pernicious vice of gaming—a vice which was degrading in its moral effects, and injurious and prejudicial to the honest industry of the country. The main question in this case was as to whether the jury gave credence to the statements which had been made by the witness Thompson. They had seen the demeanour of that witness, the manner in which he had given his evidence, and the sources from which he had derived his information, and it was for them to determine whether, taking those matters into consideration, they had observed any ground which would cause them to look with suspicion on his statements. For his own part, he had not discovered any reason to doubt the evidence of that witness, except in the fact that he had some time ago commenced an action against the defendant. With regard to the objection which had been taken by the counsel for the defendant, he had already expressed his opinion. The objection was one which he trusted would not succeed; for if it were to prevail, it would eventually repeal the statute. The question as to the value of the testimony was one for the consideration of a jury, and it would be for them to determine whether the evidence in the present case was or was not entitled to belief. If it was entitled to credence, then they would find for the plaintiff on the first, second, fourth, sixth, and ninth counts; and for the defendant, in the absence of all positive proof of payment, on the third, fifth, seventh, eighth, and tenth counts. The jury, after a consultation of about 20 minutes, returned a verdict for the plaintiff on the counts named by the learned Judge, and for the defendant on all the others. The damages, including the penalties, amounted to 3,508*l.*

Howard v. *Gossett, Bellamy, Stein, and Mitchell.*—This was an action of trespass against Mr. Gossett, the son of the Sergeant-at-Arms, for breaking and entering the plaintiff's house on the 4th February, 1840, and breaking open locks and doors, &c., and remaining there for several hours. The defendants pleaded not guilty as to the breaking the locks and doors; and as to the residue, that on the 27th July, the plaintiff was ordered to attend the House of Commons; that he disobeyed the order, and secreted himself; that on the 4th February, 1840, the House resolved that the Speaker should issue his warrant to have him brought up in custody of the Sergeant at Arms, which warrant was issued and delivered to Sir W. Gossett, and by him to defendants, as his deputies; and because the plaintiff's house was a likely place in which to find him, they went and searched the house and continued there. The replication, as to entering the house, denied that the Speaker issued his warrant, and as to the other part of the justification, admitted the warrant, but denied the residue of the plea. The whole case arose out of the prosecution instituted by a man named Stockdale, in 1840, against Messrs. Hansard, Printers to the House of Commons, for a libel published in a Parliamentary Report. Mr. Platt in stating the case entered minutely into the history of that transaction, recounting Lord Denman's judgment against the assumed authority of the House of Commons, the imprisonment of the Sheriffs, and the issuing of the writ against Stockdale's Attorney, who was the plaintiff in the present case. Into these details it is unnecessary to enter. Mr. Platt contended that the House had exceeded their authority, had invaded a house contrary to law, and that the despotic persecution shown during the previous affair was still kept up. He called upon the jury to give a verdict which should vindicate the liberty of Englishmen, teach the authorities of the House of Commons that an Englishman's home was his castle, and protect humble individuals against the oppressions of so powerful a body as the Commons House of Parliament. Witnesses were called in support of this case, who proved the main facts, but admitted that there was no rudeness or incivility or bad conduct on the part of the officers. The Attorney General, for the defence, protested against the extraneous matter which Mr. Platt had introduced into the case. The plaintiff was not entitled to damages under pretence that he had suffered unlawfully in the discussion of a great constitutional question. He had no right to ask for damages in that way like a modern Hampden—the champion and the victim of these proceedings. It did not matter here whether the warrant was or was not illegal, for excess in the execution of it made the parties executing it trespassers from the beginning. This case had been erroneously represented as a great constitutional question, in which the privileges of the House of Commons were involved. The privileges of the House had nothing to do with the matter. The officers of the House had been ordered to perform a certain duty. In performing it they had committed what was in law an excess, and the House left them to defend themselves as they might against an action brought to recover damages for this excess. There was nothing of a public nature in this action, and his Learned Friend need not have assumed such an air of boldness—the boldness of a ready martyr—when addressing the Court on this very ordinary case. The House of Commons he had attacked was dead. His Learned Friend he had no doubt would have been just as bold at the bar of that House, but the House existed no longer—it was dead. He (the Attorney-General) did not regret its dissolution. He had no cause to regret it—but as to the danger, "I assure you, gentlemen," he said amidst much laughter, "that you need be in no fear for my learned friend; notwithstanding all his attacks on that House, he is just as safe in his abuse of that dead Parliament, as any man would be who might go up and kick a dead lion." His learned friend had mentioned the sins of past Parliaments, but if he knew anything of what had been passing within these few years, he must know that there was not a single individual who did not blush for these things. He admitted that, though the officers had a right to go to the house and search for the plaintiff, their remaining in the house was an excess of authority, and for that they were liable in damages. Lord Denman, in his charge, stated at length the counts in the declaration and the pleas, and the replication, and then observed, that on these pleadings the first question was, whether the warrant was issued? On the evidence which had been given, it seemed that the issuing of the warrant was admitted; and on that issue, therefore, the verdict would be for defendant; and so would the issue on the allegation of the breaking of the locks and doors. But on the residue of the pleas, it was admitted by the counsel for defendants that there had been an excess in the execution of the warrant, and in respect of that excess the verdict must be for the plaintiff. The question then arose, what were the damages to which he was entitled in respect of this trespass? for the staying in the house was an irregularity that made the defendants trespassers *ab initio*. Here was an entry into a man's house during the time that the members of his family were in occupation of it, an entry that no man whatever would like to see take place in his house, and the circumstances of which, therefore, were to be considered, and the damages were not to be limited to the fact of the trespass being a bare excess of jurisdiction. The jury would consider the disturbance of the man's family, and all the other circumstances of the case. It was true that the persons committing the trespass conducted themselves with civility while performing what they considered to be their duty; but still, the possession of the plaintiff's house and his place of business had been invaded, and his family disquieted, and it was for the jury to say, under the circumstances, to what amount of damages the plaintiff was entitled. Those damages were not to be limited by the mere pecuniary injury which the plaintiff had suffered. The circumstances of his family were to be considered. Those who had to exercise great and extraordinary powers conferred upon them on great and extraordinary occasions, ought to be careful how they executed those powers, and ought to inform themselves, in the first instance, of the lawful limits of the power they possessed, and take care not to exceed those limits. The evidence here had been properly and fairly given; and the jury, in assessing the damages, would look at all the circumstances of the case, and award that reasonable compensation which the plaintiff was entitled to, in respect of the injury he had sustained from the trespass committed by those who had executed the powers which the House of Commons had placed in their hands. The jury retired to consider the case, and then returned a verdict for the plaintiff—Damages, 100*l.*

Carpue v. *the Directors of the London and Brighton Railway Company.*—This was an action to recover from the defendants compensation for an injury sustained by the plaintiff (the well-known surgeon), through the alleged negligence of their servants; the damages were laid at 1,000*l.* The defendants had pleaded—first, Not Guilty, by statute—and, secondly, they denied the allegation as to the want of care and skill made by the declaration. The Attorney-General, in stating the case, said that, on the 2d October, 1841, an accident—of which no doubt the jury had heard, and the consequences of which had been most serious,—had occurred on this line of railway. Upon that day the plaintiff, with his four daughters and two servants, left London for Brighton by the railway, and, taking a place in the front seat of an open carriage with his servants, his daughters were put into another carriage. Near the station called Hayward's-heath Station, at a distance of about 36 miles from London, there was a cutting called the Copyhold-cutting. There was a descent to that cutting, and in the course of that descent the accident before mentioned had occurred. The two servants of the plaintiff were thrown out and killed on the spot, and one of his daughters, who was then in a delicate state of health, suffered so much in consequence of the accident (though the plaintiff, according to the law of this country, could not complain of that in any form of action), that her death, which afterwards took place, was attributed in some degree to the accident. The plaintiff was also much injured, and was taken from under the carriage in a state of the greatest suffering. He was removed to Brighton, and there received the most anxious attention; but it was more than six weeks before he was able to leave; and when he did leave, he found himself so much injured in health and constitution as to be unable to attend to those professional duties from which he had before derived such large emoluments. It was to recover compensation for the injury that he had suffered on that occasion, produced, as he contended, by want of proper care and skill on the part of the defendants' servants, that this action was brought. Witnesses were called to substantiate this case; but their evidence was given at such length that our limits do not allow us to give the details, which merely went to support the statement of Counsel. The Solicitor-General then addressed the jury for defendants; he contended that no proof whatever had been given to satisfy the Jury that the accident had been the result of the want of care or the want of skill of the defendants' servants. He should show that the drivers employed had been on the occasion in question perfectly sober; that they had not been driving at an unusually quick rate; that they had seen and obeyed the signal which was made to them to slacken the speed, and that the accident, therefore, must have arisen from one of those circumstances over which the defendants could have no control, and for which they ought not to be held responsible. The drivers had been for some time in the service of the defendants, and were still in their service. They would be called, and from them the jury would hear all the circumstances. From their evidence, and from that of other persons, who had either been travellers by the train, or who had seen it passing along at the time of the accident, the jury would hear that it had not been improperly driven—that no blame was attributable to any one—and that, however all present must deplore the accident which had happened to the plaintiff, it would be clear that it gave him no legal right to recover compensation from the defendants. Witnesses were called to support this view, but Lord Denman having summed up the evidence, the jury returned a verdict for the plaintiff—damages 250*l.*

CENTRAL CRIMINAL COURT.—*James Molan*, alias *Leeson*, alias *Christopher James Rugg*, *Henry Rugg*, *George Nathaniel Stevens*, *Frances Rugg*, and *Thomas Morris*, convicted on Saturday of obtaining, by false pretences, a check for 40*l.*, with intent to defraud William Russell, the Accountant-General of the Court of Chancery, were brought up on Monday for judgment. Mr. Payne, who defended Henry Rugg, took a technical objection to the form of the indictment, contending that it was bad by reason of its not stating that this defendant knew that the representations made by the other defendants were false at the time they were made. The Recorder expressed his opinion that the allegations in the indictment were quite sufficient, and therefore overruled the objection. The Recorder, in passing sentence, observed that the prisoners had been convicted of a very serious offence, and one which, unless repressed with severe punishment, was likely to inflict great injury upon society. It was essentially necessary that property placed under the control of the Court of Chancery should be protected against offences of this description. Molan and Stevens were then sentenced to be transported for 7 years; Henry Rugg and Morris were ordered to be imprisoned and kept to hard labour for 12 calendar months; and Frances Rugg was ordered to be imprisoned for the same period, but without hard labour.

TATTERSALL'S, THURSDAY.—THE DERBY.

17 to 1 agst Mr. Bell's Winesour (taken)
40 to 1 — Mr. Griffiths' Newcourt (taken)
50 to 1 — Colonel Peel's St. Valentine (taken)
1000 to 20 — Sir G. Heathcote's Sirikol (taken)
1000 to 15 — Duke of Richmond's Clara colt (taken)
1000 to 10 — Duke of Grafton's Pastille colt (taken)
14 to 1 — Winesour and Blackdrop (taken)

The attendance was thin and the betting flat.

MARK LANE, FRIDAY, DEC. 9.—Since Monday we have had no fresh supply of Essex, Kent, or Suffolk Wheat, and prices may be considered nominally the same. The holders appear determined not to submit to a reduction on Foreign—at 1*s.* decline a considerable business would be done in that article; the demand for exportation is trifling only. Barley is a dull sale, Peas and Beans remain the same. The Oat Trade is in a very depressed state.

GAZETTE OF THE WEEK.

BANKRUPTCY ANNULLED.—T. Fisher, Randolph-st., Camden Town, victualler—S. Thomas, Heworth, Yorkshire, victualler.

BANKRUPTS.—T. Spence, Stratford, Essex, market gardener—J. Hilliar, Lymington, Hampshire, innkeeper—C. W. Walthew, Poultry, chemist—I. Bloomenthal, Thornton-st., Dockhead, Surrey, wholesale stationer—S. Boss, Frith-st., Soho, tailor—S. Bastick, Brighton, hatter—E. Davies, Great Crosby, Lancashire, blacksmith—T. Evans, Denbigh, scrivener—J. Meredith, Pershore, Worcestershire, woolstapler—G. B. Worboys, Bristol, perfumer—J. Archer, Liverpool, wine-merchant—J. Wicks, Trowbridge and Westbury, Wiltshire, clothier—H. T. Elliston, Leamington, Priors, music seller—J. B. Robinson and W. Robinson, Macclesfield, ironmongers—J. Davies, Wellington, Shropshire, plumber—W. Hoare, Alstonefield, Staffordshire, apothecary—J. Whitehall, Wellington, Shropshire, innkeeper—G. Portway, Birmingham, metal refiner—W. Ryland, Little Sutton, Cheshire, tanner—E. P. Powell, Southampton, tailor—J. Burslem, King's Lynn, Norfolk, stationer—T. Hartley, Liverpool, hatter—R. R. Urry, East Retford, coachmaker—R. C. Janion, Liverpool, commission-agent—J. Davies and H. Edwards, Westminster Road, Lambeth, linen-draper—J. Beaumont, Gainsborough, Lincolnshire, victualler—I. Wade, Manchester, grocer—W. Bell, Bridlington, Yorkshire, merchant—P. Blatchford, Plymouth, miller—E. Oakley and J. Wise, Poole, corn-dealers.

SCOTCH SEQUESTRATIONS.—G. Scott & Son, Hawick, millwrights—E. Hill, Annan, writer—G. Malcolm, Glasgow, wine-merchant—M. Johnston, Birsay, Orkney—D. Fogo, Row, Perthshire—W. Carswell, jun., and T. Younger, Glasgow, wrights.

BIRTHS.—At Woolwich Common, on the 29th ult., the lady of Capt. Savage, Royal Artillery, of a son—On the 4th instant, at Walton, Lady Mordaunt, of a son—On the 4th inst., in Wilton Crescent, Lady Caroline Lascelles, of a son—In Fitzwilliam Square, Dublin, the lady of Sir John Blunden, Bart., of a son—At Ashford Hall, near Ludlow, the lady of Maj.-Gen. Lechmere Russell, C.B., of a daughter—On the 6th inst., at 28, Oriental Place, Brighton, the lady of Dr. James Arnott, of a son—On the 6th June, the lady of James Winter, Esq., of Ellerslie, Van Diemen's Land, formerly of Shenley Hill, Herts, of a son.

MARRIED.—At Hackney, on Tuesday, 6th inst., by the Rev. H. H. Norris, M.A., rector, H. W. Phillips, Esq., of Corpus Christi College, Cambridge, to Catherine, youngest daughter of W. Clark, Esq., of Hackney—On the 1st inst., at Spanish Place, and afterwards at Marylebone Church, Mr. W. J. Attenbrow, of Upper George-street, Portman-square, to Rebecca, daughter of the late James Charlton, Esq., of Hexham, Northumberland.

DIED.—On the 3d instant, at Portland Place, the Right Hon. the Countess of Munster—At the house of her mother, the Countess Dowager of Clanricarde, Dominick-street, Dublin, the Countess of Howth—At Falkirk, Mrs. Lashman, aged 84, sister of the celebrated Thos. Hardy, who was tried at the Old Bailey, for high treason, 48 years ago—On the 5th instant, at the Charter-house, suddenly, Mr. Machell Stace, bookseller, aged 67—On the 5th inst., at Islington, aged 64, William Churchill, Esq.—On the 2d instant, F. D'Arcy Bacon, Esq., youngest son of the late John Bacon, of Friern-house, Middlesex, Esq., and formerly Brevet Major in the 10th Dragoons—On the 6th inst., at Abbey-lodge, Regent's Park, aged 51, Charles Norris, Esq., late of the East India Company's Civil Service, and Chief Secretary to Government at Bombay.

HORTICULTURAL SOCIETY OF LONDON.
This Day is published, Price 3*s.* 6*d.* to Fellows of the Society, and 5*s.* to Others,

A CATALOGUE OF THE FRUITS Cultivated in the Garden of the HORTICULTURAL SOCIETY OF LONDON. Third Edition. Sold at the House of the Society, 21, Regent-street; and also by Longman and Co., Paternoster-Row; J. Hatchard, Piccadilly; Ridgway, Piccadilly; Rivingtons, Waterloo-place; and by the principal Booksellers in all parts of the Empire.—N.B. A few Copies of the 2nd Edition may be had at the reduced Price of 1*s.* 6*d.* each.

WORKS WRITTEN OR EDITED BY J. C. LOUDON, F.L.S., &c.
AND PUBLISHED ON HIS ACCOUNT BY LONGMAN AND CO.
Just published, complete in One Volume, Price 2*l.* 10*s.*, and in Parts at 5*s.* each.

AN ENCYCLOPÆDIA OF TREES & SHRUBS; being the ARBORETUM ET FRUTICETUM BRITANNICUM ABRIDGED: for the use of Nurserymen, Gardeners, and Foresters.

Price 10*l.* cloth lettered,
THE ARBORETUM ET FRUTICETUM BRITANNICUM; in Eight Volumes: Four of Letterpress illustrated by above 2,500 Engravings, and Four of octavo and quarto Plates.

In One Volume, 8vo, Price 7*s.* 6*d.*,
THE HORTUS LIGNOSUS LONDINENSIS.

Price 3*s.* 6*d.*,
THE HORTUS LIGNOSUS LONDINENSIS ABRIDGED.

In One Volume, 8vo, with upwards of 250 Engravings, Price 1*l.* 10*s.*, and 3*l.* 6*s.* coloured,
REPTON'S LANDSCAPE-GARDENING.

In One very thick Volume, 8vo, of above 1,300 Pages, with 2,000 Engravings on Wood, Price 3*l.* 3*s.* bound in cloth,
AN ENCYCLOPÆDIA OF COTTAGE, FARM, AND VILLA ARCHITECTURE AND FURNITURE;
A New Edition, corrected, with a Supplement, containing above 160 additional Pages of Letterpress, and nearly 300 New Engravings, bringing down the Work to 1842.

*** The NEW SUPPLEMENT, separately, 7*s.* 6*d.* sewed.

Complete in Five Volumes, 8vo, with numerous Engravings on Wood, Price 6*l.* 6*s.*,
THE ARCHITECTURAL MAGAZINE; being a Collection of popular Articles on Architecture, Building, and Furnishing.

"We strongly recommend the 'Architectural Magazine,' as pregnant with interest and instruction, both to the architect and the general reader."—*Times*, Feb. 2, 1839.

In One Volume, 8vo, with numerous Engravings, Price 20*s.*,
THE SUBURBAN GARDENER AND VILLA COMPANION.

In One Volume, 8vo, with upwards of 380 Engravings, Price 15*s.*,
THE SUBURBAN HORTICULTURIST.

In Monthly Numbers, 8vo, Price 1*s.* 6*d.* each,
THE GARDENER'S MAGAZINE.

In One Volume, post 8vo, Price 8*s.*,
WATERTON'S ESSAYS ON NATURAL HISTORY;
With an AUTOBIOGRAPHY of the AUTHOR.

Further details respecting the above Publications will be found in the *Gardeners' Chronicle* for 1841, p. 714.

THE NUMBER FOR JANUARY NEXT WILL COMMENCE THE VOLUME OF

MAUND'S BOTANIC GARDEN, which, besides the former additions, will contain a portion of Professor Henslow's BOTANICAL DICTIONARY; and this will be continued in every succeeding Number till completed. The Dictionary will contain an explanation of upwards of 5,000 words, and nearly 200 illustrative woodcuts. The plates of Hardy Garden Flowers continue to be engraved and coloured in their usual beautiful style; and the FLORAL REGISTER, with 16 woodcuts of plants, and the AUCTARIUM, are given as usual.

Price 1*s.* 6*d.* *Large*, 1*s.* *Small, per Month.*

The January Number will afford a favourable opportunity for those who are fond of the open Garden to commence taking this now cheapest of all Botanical works.

London: SIMPKIN, MARSHALL, & Co.

To begin precisely on the 1st of January.
No. I.,

THE GARDENERS' EDITION of the BOTANIC GARDEN, at Sixpence a Month. ("The money's nothing.") The work will contain coloured Copper-plate Engravings. It will contain Sixteen Wood Engravings. It will contain plain descriptions of the best FLOWERING PLANTS, the best method of management, and everything else that's useful. What more can be desired?

If you don't order the GARDENERS' EDITION at SIXPENCE, you disregard cheap moral gratification.

A NEW WORK ON GARDENING.

THE FIRST NUMBER of THE GARDENER and PRACTICAL FLORIST for the new year will be ready January 7th, illustrated with Wood Engravings, and containing 24 columns of valuable practical information on Gardening and Flowers. Published every Saturday, Price 3*d.*

London: R. GROOMBRIDGE, 5, Paternoster-row, and sold by all Booksellers and Newsmen.

KEENE'S PATENT CEMENT.

THIS CEMENT is harder than any other known, and is especially fitted for the Walls of Hothouses, Conservatories, &c., as it neither cracks nor vegetates, and is perfectly impenetrable by insects.

The entire range of Hothouses erecting by the Government at Frogmore are about being stuccoed with it, and the price ranges nearly equally with the Cements in ordinary use for floors, and it forms a paving harder and cheaper than Portland Stone.

Patentees and Manufacturers, J. B. WHITE and SONS, Millbank, Westminster.

THE PATENT ASPHALTE PROTECTING MATERIAL, spoken so highly of in the *Gardeners' Chronicle* for 1841, p. 100, 415, 530, and p. 8, for 1842, may be obtained in Sheets—32 inches by 32 inches, 32 inches by 64 inches, 32 inches by 96 inches, of THOS. JNO. CROGGON, 8, Ingram-court, Fenchurch-street. A liberal discount to Hothouse Builders, Nurserymen, &c.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener (Sundays excepted).

Letters of inquiry will receive every attention.

MECHI'S SUPERIOR TABLE CUTLERY, Good and Cheap.—Fifty pieces fine Ivory, full size, 3*l.* 10*s.*; Kitchen Knives and Forks, 9*s.* 6*d.* the 24 pieces; at MECHI'S Cutlery Manufactory, No. 4, Leadenhall-street, London. Elegant Cases of Plated and Silver Dessert-knives, Knife-sharpeners, Ham-slices, Sheffield Plated Goods, &c.

PATRONISED by all the principal Architects and Builders in this Country and Abroad.——SEYSSEL ASPHALTE.—In consequence of the daily attempts made to imitate this valuable mineral production, and of the name of "Asphalte" being given to most of the spurious and "cheap" materials, the Directors of this Company particularly recommend Architects, Builders, and others, (for the purpose of securing the use of the genuine article,) to insert in their specifications "The Seyssel Asphalte, Claridge's Patent," and not merely "Asphalte" or "Bitumen," as, in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. For the information of those residing at a distance from London, and of those who, having employed the spurious composition, may, from its failure, have become prejudiced against the use of Asphalte, the following are mentioned as some of the distinguishing qualities of the genuine material. The Asphalte of Seyssel is of a light colour, closely resembling Yorkshire stone, has a smooth surface (without being slippery), and joints almost imperceptible; it is also free from smell, is not acted upon by change of temperature, and is at all times dry and warm, and remarkably pleasant to walk upon, and, from its elasticity, nevercracks. The fictitious material, on the contrary, has a dark and dirty-looking appearance, presents a rough and coarse surface, and, from its brittleness, is liable to crack, particularly in frosty weather. In consequence of the above qualities, the genuine material (being perfectly impervious to wet) has been used with great advantage for roofing; it can be laid down to any extent, presenting one uniform surface, and is far superior to lead, as it is not liable to expansion or contraction in consequence of any change in the temperature. For covering of arches, (to prevent the percolation of wet,) it is invaluable, the Greenwich Railway Company alone having covered upwards of 400,000 superficial feet; it has also been used on the Great Western, Birmingham, Midland Counties, South Western, Brighton, Blackwall, and other Railways; at the joint Stations, London-bridge, and at the South Metropolitan, Highgate, and Nunhead Cemeteries. As proof of the great durability of the genuine Asphalte, it need only be mentioned that the first work executed in this Country with this material, (amounting to 3,952 feet,) was at Whitehall, opposite the Horse Guards, in the month of April, 1838, and which, although only half an inch in thickness, has remained up to this time (a period of four years and eight months) in the most perfect condition. Books of Testimonials with scale of prices may be obtained on application to J. FARRELL, Secretary.
Seyssel Asphalte Company's Depot, Stangate, London.

Note—Neither the pavement in Parliament Street, London, nor the works at the Model Prison, at the Abney-park Cemetery (which from its failure has since been removed), or at the Hotel at the Slough station of the Great Western Railway, were executed by this Company.

CASE OF DISTRESS.—We, the undersigned, appeal to the Benevolence of the Public, and particularly to Gardeners, on behalf of the Widow of the late Robert Runciman, who is left with five children under ten years of age, wholly unprovided for. The late Robert Runciman was many years Gardener at Coptfold Hall, Essex, which situation he was obliged to quit three years since in consequence of the gentleman leaving the place; he was not able afterwards to obtain a situation in consequence of his numerous family, and he commenced jobbing Gardener, when he was unfortunately attacked with severe Rheumatism, which confined him for many months to his bedroom; and thus the little savings he had previously made became exhausted before his death. We knew him to be a steady, sober, and industrious man, and therefore confidently make this appeal on behalf of "the widow and the fatherless," in the hope that it will meet with that attention which the circumstances of the case deserve.

We shall be happy to receive Subscriptions, however small, in her behalf, and we beg to state, in justice to Mrs. Runciman, that this appeal is made without her knowledge.

John Green, Gardener to Sir E. Antrobus, Lower Cheam, Surrey.
David Ferguson, Gardener to the Duke of Buckingham and Chandos, Stowe, Bucks.
Saml. Young, Gardener to W. Branston, Esq., Skreens, Chelmsford, Essex,

Mr. Charlwood, of Tavistock Row, Covent Garden, has also kindly undertaken to receive Subscriptions.

MUDIE and SONS, 15, Coventry-street (opposite the Haymarket).
N.B.—The Trade supplied.

ROWLAND'S MACASSAR OIL.—Under the Special Patronage of Her Most Gracious Majesty the QUEEN, the ROYAL FAMILY, and the several COURTS OF EUROPE.

This Oil is universally acknowledged to be the ONLY ARTICLE that will effectually PRODUCE and RESTORE HAIR, prevent it from FALLING OFF OF TURNING GREY, free it from SCURF and DANDRIFF, and will render it DELIGHTFULLY SOFT and FLEXIBLE. It will also preserve the coiffure in the heated atmosphere of crowded assemblies.

CAUTION.—Much PERNICIOUS trash is now offered for sale as "MACASSAR OIL:"—it is therefore of great importance to Purchasers to see that the words "ROWLAND'S MACASSAR OIL" are engraven on the Wrapper. All others are "Gross Impositions."

The Proprietor's Signature is also engraven on the Wrapper, thus:—A. ROWLAND & SON, 20, HATTON GARDEN, LONDON.
Countersigned "ALEX. ROWLAND."

Price 3*s.* 6*d.*; 7*s.*; family bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* per bottle.

Ask for "ROWLAND'S MACASSAR OIL."—Sold by them, and by Chemists and Perfumers.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 10, 1842.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—MEETING AT DERBY, JULY, 1843.

PRIZES FOR IMPLEMENTS.

For the Plough best adapted to heavy land, 20*l*.; for the Plough best adapted to light land, 20*l*.; for the Drill which shall possess the best method of distributing compost, or other manures in a moist or dry state, quantity being especially considered, 30*l*.—N.B. Other qualities being equal, the preference will be given to the Drill which may be best adapted to cover the manure with soil before the seed is deposited. For the best Scarifier, 15*l*.; for the best Chaff-cutter, 10*l*.; for the Draining Tile for agricultural purposes, which shall have been *bonâ fide* sold at the cheapest rate during the past year, regard being had to the local circumstances affecting the cost of production, and which, in the opinion of the Judges, shall be sufficiently durable, 10*l*.; for the best set of Harrows, 10*l*.; for the best Agricultural Carriage, with or without springs, for the general purposes of road and field, 20*l*.; for the best and cheapest Stack-covering, to supersede Thatching, 20*l*.; for the best Drill-Presser, 10*l*.; for the best Churn, 5*l*. The Society wishes to call the attention of Machine-makers to Improved Steam Apparatus for Roots,—to small or Portable Corn Mills,—to Broad Shares for paring Stubbles,—to a Rake for collecting Couch,—to Agricultural Harness and Gearing generally: for which Prizes or Medals will be awarded by the Judges. The Judges will especially consider the selling-price of the Implements exhibited, which must be stated in the certificate; and they are instructed to withhold Prizes where there shall not appear to be sufficient merit. Printed Forms of Certificates of Entry by Exhibitors may be obtained of the Secretary, at No. 12, Hanover-square, London, and must be returned to him, filled up, by the 1st of June, 1843; the Council having decided, that in no case whatever shall any Certificate be received after that date. All Implements must be in the Show-yard before Nine o'clock on the evening of Friday, the 7th of July; and all Implements so admitted will be liable to be proved by actual trial on the recommendation of the Judges. The Judges will make a selection of such Ploughs and other Implements as appear to them to possess peculiar merit, and reserve their final decision, where necessary, until they shall have tested them in a subsequent trial, to be hereafter arranged, and to take place at a suitable season of the year.

By Order of the Council,

London, Dec. 10, 1842. JAMES HUDSON, Secretary.

ROYAL BOTANIC SOCIETY OF LONDON.—Gardens, Inner Circle, Regent's Park. Exhibitions, 1843. The Council hereby give notice, that in the course of the ensuing year, Exhibitions will be held in the Gardens, at which Premiums will be awarded for the best Specimens of ornamental and interesting Plants and Flowers, and of Paintings, Drawings, Works of Art, and Manufactures, in which the representation of Plants and Flowers is introduced. Full particulars will be announced in future Advertisements. By order of the Council,

JAMES DE CARLE SOWERBY, Secretary.

UNDER THE PATRONAGE OF HER MAJESTY.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY FLOWER SHOWS, Season 1843. At the Horns Tavern, Kennington, WEDNESDAY, April 19th, and WEDNESDAY, May 17th; at the Royal Surrey Zoological Gardens, TUESDAYS, June 13th, July 25th, and September 19th.

The Committee beg to call the attention of the Public to the following regulation:—*None* but *Members* to compete for *Prizes* offered by the Society to any class, with the exception of Seedlings, which will be open to all England; at the same time, specimens allowed to be exhibited by non-members, if deserving, may be recommended by the Judges to the Committee, for rewards.

Terms of subscription, 1*l*. per annum, which entitles Members to the privilege of exhibiting without paying any entrance; also, admission for two friends to all Shows of the Society, in addition to their personal ticket. R. P. CUMING, Hon. Sec.,
3, Dean's-row, Walworth.

FUCHSIA ST. CLARE.

YOUELL & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Advertisement of the above magnificent Fuchsia, inserted in this Paper of the 3d inst., together with their two new Verbenas.

Great Yarmouth Nursery, Dec. 15, 1842.

EVANS' "NORTH MIDLAND DAHLIA."—A few Ground Roots for disposal of the only Seedling recorded as having beat all the *old* and *new* varieties at a large public open Exhibition. See *Gardeners' Chronicle* and *Gazette*, Nov. 12, 1842. Apply to J. EVANS, Florist, Rotherham, Yorkshire. —Dec. 7, 1842.

TO GENTLEMEN PLANTING FOR IMMEDIATE EFFECT.

J. OGDEN begs to recommend his fine Stock of Large PORTUGAL LAUREL, PHILLYREA, SIBERIAN ARBOR VITÆ, RHODODENDRONS, &c., &c., as being particularly handsome well-grown Plants, in fit state to remove with perfect safety; and the Nursery being advantageously situated for Canal or Railway Conveyance, so that they may be conveniently removed to any part of the country, he respectfully solicits orders for the same, which may be had on moderate terms, as well as a general Assortment of Nursery Stock.—Coventry, December 15, 1842.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEES, AND LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM-RISE, NEAR LONDON, (removed from Walworth,) BY APPOINTMENT FLORIST TO HER MAJESTY, respectfully informs the Nobility, Gentry, and Public, that he has a fine Selection of the above Flowers, which he can offer at the following very moderate prices:—

RANUNCULUSES, 100 roots in 100 superfine sorts	£4	4	0
Superfine mixtures from 5*s*. to 21*s*. per 100.			
ANEMONES, 100 roots in 100 superfine sorts . .	3	0	0
Superfine mixtures from 7*s*. 6*d*. to 21*s*. per 100.			
AURICULAS, 25 superfine sorts, 1 plant of each .	3	13	6
CARNATIONS, 25 superfine sorts, 1 pair of each .	3	10	0
PICOTEES, 25 superfine sorts, 1 pair of each . .	2	10	0
YELLOW PICOTEES, 12 superfine sorts, 1 pair of each	2	2	0

LILIUM LANCIFOLIUM ALBUM, from 5*s*. to 42*s*. each.
" " PUNCTATUM, from 10*s*.6*d*. to 42*s*. each.
" SPECIOSUM, small bulbs, from 63*s*. each.

⁂ The Trade supplied.

JOHN SALTER, of Versailles, France, intends sending out (to the Trade only) about the 1st May, several new and fine Seedling Chrysanthemums, which have this season been proved by him to possess those qualifications which must recommend them to all lovers of this last of autumnal flowers. The varieties he has already sent to England are now becoming generally known; suffice it to say, that the *Chronicle*, *Gazette*, and other Horticultural Journals are unanimous in describing the French varieties (introduced by him) as far superior in form and colour to the older kinds. The novelties he now offers will, he feels confident, still further enhance their reputation; among them will be found some of a very large size, others totally new in colour, and the whole of first-rate qualities. At the same time he will have ready 6 splendid Seedling Fuchsias of robust habit, large glossy foliage, and flowers of unusual size; which will challenge competition with any yet offered to the public: price 1*l*. 10*s*. the set. He can also furnish all the new French varieties of Iris germanica.

All letters must be post-paid to Versailles, and all orders will be delivered, free of expense, to London by the 1st May, 1843.

SEEDLING DAHLIAS FOR 1843.

MRS. JAMES RICHARDSON and TODD'S LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20th, 1842.—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards of York. This Flower was shown at the Royal South London Floricultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first-rate. The following was the decision of the censors: Form, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasionally tipped; class of quality, first-rate.—*From the Gardeners' Chronicle and Gazette.*

Also obtained the following prizes: 1st prize at Hull, August 30th; 1st prize at Beverley, Sept. 7th; awarded an extra prize at the Royal South London Floricultural Society, Sept. 13th; 1st prize at Leeds, Sept. 21st; 1st prize at Newcastle, Sept. 21st; 1st prize at Sunderland as a superior first-class Seedling, Sept. 27th; 1st prize at the York Floral and Horticultural Society, Sept. 28th; 1st prize at the York Floricultural Society, Oct. 1st; 1st prize in its class as the best white or blush, ditto.—Height, 4 to 5 ft. Plants, 10*s*. 6*d*.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size; very constant, and a decided first-rate show flower. Height, 4 ft.; Plants, 10*s*. 6*d*.

All orders addressed J. EDWARDS, Florist, Layerthorpe, Nursery or Seedsman, 7, New Bridge-street, York, will be st,rictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec., 1842.

FUCHSIA LANEII.

MESSRS. LANE & SON, of GREAT BERKHAMPSTED, HERTS, in announcing that the above-named new Seedling will be ready for delivery early in the ensuing April (in rotation as ordered), feel that they are entitled to lay before the public some of the grounds upon which they, as well as others, believe it to possess a claim to a decided superiority over any other hybrid extant, viz.:—

The *Gardener's Gazette* (page 465), speaking of its exhibition at the Horticultural Society's grounds at Chiswick, in July last, says—"Messrs. LANE and SON exhibited several plants of a handsome hybrid seedling Fuchsia, possessing many valuable properties, the flowers being large and well-shaped, sepals and petals distinct in colour, the latter being of a fine purple; the plants appeared to flower remarkably freely."

PAXTON, in his "Magazine of Botany," of August last, says of it—"The habit is dwarf and close; the leaves ample, with the elegance of the older species, and none of the coarseness of the more modern kinds; and the flowers are somewhat of the shape of the old globosa, but more expansive, and singularly large. Their sepals are bright crimson, and the petals darker, or of a light purplish hue. It is one of the best hybrids we have seen."

HARRISON, in his "Floricultural Cabinet" of the same month, says—"The Seedling Fuchsia sent by Messrs. LANE is the best of its class (the dark) we have ever seen. Its immense size, good form and colour, will always render it attractive and deserving a place in every collection. No doubt it will be much in demand."

This Fuchsia was the only one of last season to which any prize was awarded by the Horticultural Society, and this was at the Show on the 16th of July; it was only exhibited at the above Show, at the Stamford Hill (Clapton) Show on the 21st, and at the South London Floricultural Society's Show (Surrey Zoological Gardens) on the 26th of the same month, at both of which prizes were awarded to it.

It can be sent *by post* to any part of the United Kingdom.—The usual allowance to the Trade, where six plants are taken.

Berkhampsted Nurseries, Dec. 15th, 1842.

EVERGREEN OAKS.

RENÉ LANGELIER, NURSERYMAN and FLORIST, St. Helier, Jersey, has the honour to inform the Public in general, that he has a few Thousand Evergreen Oaks to dispose of: fine strong Plants, two and one-year old; two years old, from 18 inches and upwards at 1*l*. 5*s*. per 100; one year old, 10*s*. 6*d*. per 100. They are well worth the attention of the public.—R. L. also has fine dry Roots of White Defiance Dahlia, at 2*l*. 2*s*. per root. This Dahlia, R. L. has no hesitation to say, will prove the best of its class next season, having exhibited it with the greatest success in all classes, for which he gained *Three Medals*. It is very late in breaking, therefore it is necessary to force it early. Also, Jersey Maid—Blush, full flower; when shaded, becomes a superb white; well cupped and full centre. All Letters post-paid; references from unknown Correspondents.

TURVILL'S BLACK DAHLIA, THE "ESSEX TRIUMPH."

THOMAS BROWN begs to announce that he has purchased the entire Stock of the above superb and universally-admired Dahlia, which has been justly pronounced the greatest novelty yet produced, and is essential to the most limited grower. The following is the description given by the Floricultural Society of London, Sept. 6, when nine Blooms were exhibited:—"Of the petal: *form*, good; *substance*, good; *arrangement*, good; *eyes*, complete and good in every specimen; *depth*, great and globular; *size*, full; *general form*, excellent; *class of quality*, first-rate." The following award will prove that it maintained its high character successfully throughout the season.

1841	Chelmsford . .	Sept.	12,	1	bloom		1st prize

It is very constant, and never shows an eye, the centre being well up when young. Fine habit; throwing its blooms out in the most graceful manner.—Plants in May, 10*s*. 6*d*. each; the usual allowance to trade where a dozen are taken.

Also plants, at the same time, of the following Seedlings, which have been shown and obtained prizes at the principal open Shows, and can be recommended as good Show Flowers.

BROWN'S PERPETUAL GRAND—bright crimson; fine broad petals; well cupped, full, and constant—10*s*. 6*d*.

BROWN'S QUEEN OF TRUMPS—white, tipped with purple; petals of good substance, well arranged, and of great depth—10*s*. 6*d*.

BROWN'S MIRANDA—blush white, shaded with rose; of unusual depth—7*s*. 6*d*.

BROWN'S BLUE BONNET—bright rosy purple; good petal, full, and very constant—7*s*. 6*d*.

A few Ground and Pot Roots of ADMIRAL STOPFORD and BEDFORD SURPRISE to dispose of.

Slough Nursery, Nov. 17, 1842.

---

* 18 blooms were also shown not for competition.

† 30 blooms were also shown not for competition.

CHAPMAN'S NEW SPRING POTATOES.—Messrs. CHAPMAN beg to announce that they are ready to deliver the finest samples of these new Potatoes that can be sent to table, at 15*s*. per bushel: they will keep unimpaired from this time till June, if the directions sent with them be followed. Direct all orders to C. & T. CHAPMAN, Brentford End.

THE TRUE TOBOLSK RHUBARB.

YOUELL & CO. beg to announce that they are now housing the above for Forcing. Roots planted now will be ready for cutting at Christmas.

This Rhubarb being the earliest in the open border by three weeks of any yet introduced, renders it highly valuable for Forcing; its colour is of a beautiful transparent coral; and for delicacy of flavour it is unequalled. It can be forwarded with safety to any part of the United Kingdom, on the receipt of a Post-office order, at the rate of 12*s*. per dozen roots.

Great Yarmouth Nursery, Dec. 15, 1842.

CHARLES FARNES, No. 128, ST. JOHN-STREET, LONDON, respectfully informs the Public that his Collection of New KITCHEN-GARDEN SEEDS are now ready to send out. Owing to the fine harvest, the quality is excellent, and will be found to give general satisfaction. C. F. being connected with the principal Market-Gardeners round London and in the Provinces, is enabled to select the best and most choice varieties from their original sources.

Farnes' Superior First Early Peas—this has been the first Pea brought into Covent Garden Market for some years past—height, 1½ to 2 ft.
Flack's Dwarf Blue Victory Pea, 2 ft.
Knight's Blue Dwarf Wrinkled do., 3 ft.
American Dwarf White do., 3 ft.
Improved Green Marrow do., 4 ft.
Auvergne, new variety, do., 4 to 5 ft.
Young's Large Milford Marrow do., 5 to 6 ft.
New Giant Wrinkled do., 6 to 7 ft.
Marshall's Early Prolific Beans
True Dwarf Green Fan do.
Extra Large Green Windsor do.
New-England Long-podded do.
Transparent Early Frame Radish
French Early Olive-shaped do.
Scarlet Turnip do.
White Dutch do. do.
White Spanish Onion
Brown Deptford do.
Dutch Silver Pickling do.
New White Globe do.
James Keeping do.
Imptd. Early Dutch Horn Carrot
Large Altringham do.
,, White Belgian do.
Ady's fine Large Cos Lettuce
True Paris White do.
,, ,, Green do.
Black Seed Bath Cos Lettuce
Siberian Green do.
Large Malta Cabbage do.
True White Silesian do.
Walcheren White Broccoli—the best and earliest variety in cultivation.
Myatt's Fine Early White Cape do.
Chappell's Large do. do. do.
,, Splendid Cream do.
Walton's Yellowish-White do.
Knight's Self-protecting do.
Earliest London-saved Cauliflower
Imported Brussels Sprouts
Seymour's Superb Solid White Celery
True Giant Manchester Red do
Superior Early Dwarf Cabbage
Early Dwarf York do.
,, ,, Crompton do.
Large Early Hope do.
True Drumhead Savoy
Imported Early Dutch Turnip
Early Round Nonesuch do.
True Dark Blood-Red Beet
Large Silver-stemmed do.
Imported French Sugar do.
,, ,, Summer Endive
,, ,, Yellow-leaved do.
Dwarf London Green Curled do.
Morgan's Early Nonesuch Potatoes
True Early Ash-leaved Potatoes.

With every variety of Vegetable and Flower Seeds in cultivation; a general Catalogue of which, with prices, will be forwarded on application.

SHIRLEY VINEYARD, NEAR SOUTHAMPTON.—NURSERY DEPARTMENT.

CLEMENT HOARE respectfully announces that he has now on sale an extensive collection of Grape Vine Plants of superior growth, and of the most approved sorts in general cultivation, varying in price from 2*s*. 6*d*. to 7*s*. 6*d*. each.

Lately Published,

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS. By CLEMENT HOARE. 3d edition. 8vo, 7*s*. 6*d*. boards. LONGMAN & Co., London. Sold by all Booksellers, and at the Vineyard at Shirley.

CONIFERÆ.—The Subscribers have this Season to offer the following:—

Pinus austriaca, 1 year transplanted, per 1000	30s.	0
,, ,, 1½ ft., in pots, each	1	0
,, Banksiana, 1 ft., in pots, each	15	0
,, Cembra, 1 year seedling, per 100	7	6
,, ,, 2 years seedling, per 100	10	0
,, ,, 1 year transplanted, per 100	15	0
,, ,, 2 to 3 inches, in pots, each	0	3
,, ,, 4 to 6 inches, in pots, each	0	6

PETER LAWSON AND SON, EDINBURGH,
Seedsmen and Nurserymen to the Highland and Agricultural Society of Scotland.

Agents,—Messrs. W. and J. NOBLE, Seedsmen, 152, Fleet-street, London.

ADAMSON'S FINAL SALE.

Five useful Cart Horses, Waggon, Carts, Capital Chaise, a newly-erected Seedshop covered with lead, excellent Chests of Seed Drawers, Bins, Counter, a few lots of useful Timber, &c.

MESSRS. PROTHEROE and MORRIS are instructed to submit the above to public competition, by Auction, on the premises, Stoke Newington Common (by order of the Trustees), on MONDAY, Dec. 19th, 1842, at 11 o'clock. Also the remaining Nursery Stock, consisting of Fruit and Forest Trees, Deciduous Shrubs, &c; about 2,000 of Myatt's "British Queen" Strawberry. May be viewed prior to Sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price *5l. 5s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WAYTE'S New Patent Land-presses and Drills.

PENN'S SYSTEM PERFECTED—FOR OBTAINING A FREE CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL & OTHER BUILDINGS.

W. HILL having had every opportunity of making himself acquainted with the best method of constructing Horticultural Buildings of every kind—to command the above truly-desirable result—and having with much satisfaction witnessed the gradual improvement in the adaptation of this principle to almost every variety of Building, begs to announce to the Nobility and Public generally, that he erects CONSERVATORIES, HOTHOUSES, PITS, &c., &c., upon the above system, which has (*at an immense cost to the inventor*), been brought to *great perfection*, and heats the same by HOTWATER APPARATUS, with improved Tube or Conical Boilers. W. HILL also adapts DR. ARNOTT'S NEW BALANCED REGULATOR to the Boiler Apparatus, by which an immense saving of fuel is effected, the greatest regularity of Temperature preserved, and much time and trouble saved. PENN'S SYSTEM only requires publicity to be appreciated. The Public are therefore invited to inspect its efficient working at the Inventor's Residence, Lewisham. The great end gained by adopting this system, *is a perfect and rapid Circulation*, producing consequently an equable temperature throughout the building (of whatever construction), and renders access to it at all times safe and agreeable, ladies of the most delicate constitution being enabled to remain for hours in a temperature greatly exceeding summer-heat, with as much comfort as could possibly be derived from an out-door temperature equally high. W. HILL would refer any, who may desire to apply the above system to Forcing-Houses in particular, to Mr. JOHN WILLMOT, of Isleworth, who after 40 years' experience has adopted this system throughout his extensive Establishment. Designs, and any further information, upon application to W. HILL, Builder and Surveyor, Lewisham.

ECONOMIC HEATING APPARATUS.

W. HILL having repeatedly observed in the Columns of the *Gardeners' Chronicle*, inquiries for a cheap mode of heating small Greenhouses and Conservatories, begs to inform any who may hitherto have denied themselves a pleasing Recreation on account of the expense and trouble attendant upon either Water Apparatus, or the common Smoke Flue, that he engages to warm Buildings of the above description, upon an entirely new principle, with DR. ARNOTT'S NEWLY-INVENTED BRICK STOVE, at a cost of about one-fifth that of the most common mode by hot water. The following are some of its advantages, viz:—It occupies very little room, is altogether within the House, no Smoke or Dust, requires attention once in 24 hours, may be made very ornamental, costs in working from *2d.* to *6d.* per day according to size. May be seen in operation, by applying to W. HILL, Builder and Surveyor, Lewisham. W. HILL also adapts the above to Churches, Chapels, Public Offices, large or small Libraries, Picture Galleries, Nursery and other private Apartments, for which it is especially and admirably suited.

WANTS a SITUATION as GARDENER, a middle-aged single Man; has been considered first-rate Flower and Pleasure-ground, also Kitchen and Fruit Gardener. Can have upwards of three years' character. Apply to SAMUEL HOPKINS, Grocer, Croydon.

WANTS a SITUATION as GARDENER, a steady, active Single Man, 28 years of age, who perfectly understands his business in all its branches, and can have a four years' character from his last situation. Direct A. Z., at Mr. COOPER'S, Nurseryman, Brixton Hill, Surrey.

TO NOBLEMEN AND GENTLEMEN.—WANTS a SITUATION as GARDENER, or as GARDENER and FORESTER, a Married Man, about 30 years of age; the most satisfactory references can be given as to ability, integrity, industry, &c. Address, W. H., at Messrs. VEITCH and SON'S, Nurserymen, Exeter.

N.B.—Salary about *70l.* per annum, with cottage, &c.

WANTED, in the COUNTRY, a steady, active, and intelligent Young Man, as an ASSISTANT in a Nursery and Seed Business; he must be of an unexceptionable character, and have a good knowledge of his trade, and will be required to live entirely in the house, and conform to the rules of a Dissenting family.—Apply to Mr. BRISTOW, Knightsbridge, London.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BROWN'S IMPROVED GARDEN POT.

ROBERT BROWN having made an important and successful improvement in the construction of Garden Pots, submits them to the Floricultural Profession, and to all who are interested in the propagation and cultivation of Plants. It is well known that many valuable plants are annually lost, or much injured, by having the delicate fibres of their roots dried up, from the pots in common use becoming heated by the sun's rays, or from exposure to drying currents of air, &c., for which evils a remedy has long been sought. The Improved Garden Pot now offered to the Public is intended to counteract this irregularity of temperature, by being made hollow-sided, with an aperture on the rim, that the space between the outer and inner surface may be filled with water when required, and the aperture being made air-tight by means of a peg, a uniform degree of coolness or humidity may be preserved, and the plants, although exposed to the mid-day sun, will have their roots secured from injury. The Improved Garden Pot does not differ in appearance from those in common use, but the advantages of its construction, for the growth of plants, or for the propagation of cuttings, are too obvious to need further comment.—R. B. has submitted his invention to several eminent cultivators, from whom he has received the greatest encouragement.

Specimens may be seen at the Horticultural Society's Rooms, 21, Regent-street, or at Mr. BROWN'S Pottery, Surbiton-hill, near Kingston, Surrey, and at his private residence, Ewell.

GUANO ON SALE BY THE IMPORTERS,
ANTHONY GIBBS AND SONS, LONDON;
GIBBS, BRIGHT, AND Co., LIVERPOOL AND BRISTOL.

THE NUMBER FOR JANUARY NEXT WILL COMMENCE THE VOLUME OF

MAUND'S BOTANIC GARDEN, which, besides the former additions, will contain a portion of Professor Henslow's BOTANICAL DICTIONARY; and this will be continued in every succeeding Number till completed. The Dictionary will contain an explanation of upwards of 5,000 words, and nearly 200 illustrative woodcuts. The plates of Hardy Garden Flowers continue to be engraved and coloured in their usual beautiful style; and the FLORAL REGISTER, with 16 woodcuts of plants, and the AUCTARIUM, are given as usual.

Price 1s. 6d. Large, 1s. Small, per Month.

The January Number will afford a favourable opportunity for those who are fond of the open Garden to commence taking this now cheapest of all Botanical works.

London: SIMPKIN, MARSHALL, & Co.

Now published, price 10s.,

A SECOND Edition of MILL'S TREATISE ON THE CULTURE OF CUCUMBERS, MELONS, SEA-KALE, and ASPARAGUS, with a descriptive Plate of his Pit, and also daily Notes of Practice from December to February inclusive.

Published by WM. SMITH, 113, Fleet-street, and sold by all Booksellers.

In 12mo., price 5s. cloth lettered,

GUIDE TO THE CONSERVATORY; being a concise Treatise on the Management of the Hot-house and Greenhouse; the Forcing of Bulbs, Shrubs, &c.; and the best mode of keeping a Succession of Bloom through every month of the year; exemplified in a select list of the most admirable plants of the present day, under the arrangements both of Jussieu and Linnæus—including their native country, propagation, and the soil adapted to each.

By RICHARD BAINBRIDGE,
Flower Gardener to the Right. Hon. Lord Wenlock.
From Notes of the Author's Daily Practice, and Communications furnished by liberal eminent Floriculturists.

⁂ The peculiar characteristic of this work is the means of obtaining a constant and large supply of flowers. It includes a very extensive List of Orchidaceæ, with their cultivation as pursued by the most eminent practitioners.

London: ROBERT BALDWIN, 47, Paternoster-row.

THE "GARDENERS' CHRONICLE."
WANTED the FIRST VOLUME of the "GARDENERS' CHRONICLE." Any person having a clean Copy, bound or not, will find a PURCHASER by addressing a letter, stating the price, to W. B., 154, Strand.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 17, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Dec. 20	Linnean	8 P.M.
	Floricultural	6½ P.M.
Wednesday, Dec. 21	Microscopical	8 P.M.
Tuesday, Dec. 27	Zoological	8½ P.M.

THE arguments by which we last week sought to arouse the attention of our readers to the pressing importance of employing the labouring poor had scarcely left our pen, when it was announced in the *Times* that the Duke of Buckingham had practically admitted the urgency of the necessity on which we had insisted. It appears that the labourers belonging to the parish of Brill have been suffering severe privations from the want of employment. A short time since nearly 40 persons belonging to that parish were inmates of the union-house at Thame. Those out of the house unemployed made an attempt to see the Duke of Buckingham for the purpose of stating their grievances. The Duke relieved their immediate necessities, and ordered the parish officers of Brill to attend at Wotton House; requested them to call a parish meeting, for the purpose of allotting the men among the ratepayers; and stated, that if the rest of the ratepayers would take the men according to their assessment to the rates, he (the Duke) would choose eight labourers for his share for the winter, which is something more than his proportion. The parish meeting was accordingly called, and an arrangement made to send one labourer for each 70*l*. assessment to the poor-rates; those paying less than a 70*l*. assessment to take a labourer so many days a week in proportion. Later information from the country tells us, to our joy, that others of the noble and the rich are taking a similar course.

It is evident, then, that we were not an hour too soon in our observations upon the state of the labouring poor; and we now most earnestly repeat our recommendation, that every shilling of spare money which the country can afford, instead of being applied to the relief of distant evils, should be used to alleviate the distress at our own doors—among our own people —not in charity, but in the purchase of labour to increase the productiveness of the land. It is entirely our own fault if the land of England is not as fertile as that of any part of the earth, provided we sharpen our wits, and use our ample means, and employ our industrious poor in rendering it so. There is no occasion to purchase foreign produce to bring about this end; we need not run all over the world in search of wealth while millions of broad acres lie waste in our own country—while myriads of tons of fertilising materials are wasted as recklessly as if we melted our sovereigns into waterpipes, and while tens of thousands of powerful and skilful hands are able to rescue all this wealth from dissolving in thin and viewless air. In a word, drainage and manure are all that our land requires, and both are to be purchased by securing the happiness of the poor; for labour, and little except labour, is concerned in effecting the one and economising the other. For to-day, we confine ourselves to drainage.

There may be many who think that all arguments to prove the paramount importance of draining are at the present day superfluous, because it is a fact universally known and admitted by enlightened men. We, however, do not entertain the same opinion; on the contrary, there are, we doubt not, thousands of well-informed people who do *not* know what the advantage of drainage is, or who do not think that the advantages are such as are applicable to themselves. It must, indeed, be so, or we should hear nothing of unemployed poor; for there is hardly a farm or garden that would not be benefited by thorough drainage, and the greater part of them are much in need of it. We are not speaking here of cuts, or as our Norfolk friends say, grups, made over the surface to carry off a few puddles; but of that effectual underground draining which will allow nothing stagnant to gather within a yard of the surface; which conveys away all superfluous water to main ditches, opening into rivers which discharge their contents into the ocean. That is the sort of draining, the want of which is notorious all over the kingdom.

It is partly because draining is itself the element of new wealth, and partly because it is effected by no other cost than that of employing poor men, that we would just now so much insist upon it: for it may well be done at the present season in many places, and the advantage will be felt in the harvest of next year.

Drainage of land increases its fertility, and renders it less expensive to work, if it is not clayey. Well-drained gardens resist frost infinitely better than wet ones: the soil is warmed, and crops are obtained earlier; the health of trees is greatly benefited; the quality of fruit is much improved, and its quantity augmented; gum and canker are comparatively unknown, and many kinds of noxious insects disappear. What is true of gardens is equally true of farms; for the laws which regulate the healthy condition of plants are the same in all cases, and apply to Corn and Turnips as much as to Peach-trees and Asparagus-beds.

In explanation of some, at least, of the reasons of this important effect of drainage, we cannot do better than quote the words of Professor Johnston. After enumerating other advantages of the operation, he has these observations (*Lectures*, p. 442): "It allows the water of the rains, instead of merely running over and often injuriously washing the surface, to make its way easily through the soil. And thus, while filtering through, not only does the rain-water impart to the soil those substances useful to vegetation, which, as we have seen, it always contains in greater or less abundance, but it washes out of the upper soil—and, when the drains are deep enough, out of the subsoil also—such noxious substances as naturally collect and may have been long accumulating there, rendering it unsound and hurtful to the roots. The latter is one of those benefits which gradually follow the draining of land. When once thoroughly effected, it constitutes a most important permanent improvement, and one which can be fully produced by no other available means. The same openness of the soil which enables the rains to wash out those soluble noxious substances which have been long collecting, permits them to carry off also such as are gradually formed, and thus to keep it in a sound and healthy state."

But we have not room to dwell in this place upon the reasons why drainage is so important. We would rather entreat attention to the results *that have already followed it*.

In Aberdeenshire, and elsewhere, crops ripen on the land that has been drained about a fortnight sooner than they did before the drainage (*Prize Essays, Highland Society*, 2, p. 171). In Berwickshire, we are told, in the same place, land now grows very good crops of Turnip or Rape *where none could be had before the drainage took place*; and, in general, it bears Wheat well.

We have the evidence of Sir James Graham, that land worth to him 4*s*. 6*d*. an acre, became worth 20*s*. an acre, after draining and subsoil ploughing, at a cost of 6*l*. 18*s*. 4*d*. an acre; thus returning 11 per cent. on the outlay—*all of which was in labour* (*Journ. Agr. Soc*. 2, 276). On Lord Hatherton's estate at Teddesley Hay in Staffordshire, a farm worth only 254*l*. 10*s*. 9*d*. a-year, was increased to the annual value of 689*l*. 13*s*. 1*d*., at a cost of no more than 1,500*l*., *all in labour* (*Ibid*. p. 279).

Sir Robert Peel states, that from a field of his which was thoroughly drained, and which before the operation did not produce more than "a brush of a crop of Turnips," he immediately obtained *four times* as many Turnips as at any previous time before—as much indeed as 27 tons an acre. On the farm of Swellhead, in Kincardineshire, Mr. Boswell informs us that undrained land worth 52*l*. a-year, became, by skilful management, principally by draining, without which all the rest would have been useless, worth 500*l*. a-year. In this case, the total outlay, for improvements of all kinds, was 5,400*l*.—*and it was nearly all in labour*.

In Berkshire, Mr. Rham tells us, that in Windsor Forest, land which was so rotten and bad that sheep could not stand on it, nor carts be drawn over it, suddenly became by underdraining so sound as to carry immediately afterwards 9 quarters of Oats an acre, and afterwards "a splendid crop of Wheat" (*Ibid*. 2, 282). We can ourselves point to a piece of heavy land, so wet that it would carry nothing, which immediately after bush-draining, at 20 feet intervals, produced at the rate of 18 tons of Potatoes an acre, with no extraordinary assistance from manure.

Be it observed that we do not take these as the best cases that can be found, but merely as illustrative *facts* that happen to be conveniently at hand. Such results arise out of the nature of things, and therefore no circumstances whatever can alter them. Indeed, to expect plants to thrive or crops to flourish in wet undrained lands, is about as reasonable as to hope to fatten cattle with their heads only above water.

In an excellent pamphlet *, which we particularly recommend to our readers, Mr. Bailey Denton, whose profession as a land-agent has given him great experience in these matters, says—"It is admitted by all who understand the subject, that where drainage has been carried on upon correct principles, and with proper skill and energy, 8 bushels or 1 quarter of Wheat per acre has been added to the annual produce. 10,000,000, out of 12,000,000, are usually allowed as the undrained or ineffectually-drained acres under tillage; and as the strong lands are those which stand most in need of drainage, and are also the best Wheat lands, it may be assumed that five-sixths of the land under Wheat may, by being drained, yield a quarter more per acre on the average, which will be a little more than 3,000,000 of quarters annually: and this, added to the quantity quoted as the present estimated produce, will bring the supply as much above the demand as it is now below, which will more than compensate any deficiency which may be felt on the repeal of the Corn laws, by the withdrawal of the poorer lands from tillage."

Nor is this all: when stock are kept on undrained land, it is notorious that they take the rot, from which they escape on drier soils; a fact philosophically accounted for by Liebig, and which affords an additional motive to the landowner for immediately setting about employing the poor in the thorough drainage of his land.

"There are," says Mr. Kimberley, "thousands of acres, perhaps millions, that are at present worse than lying waste, causing whole districts to be unhealthy to man and beast—acres that will not support a goose, or at least a sheep, per acre—some let to farmers at from 2*s*. 6*d*. to 5*s*. per acre; all of which, with little exception, if properly drained and well cultivated in a regular course of alternate husbandry, would increase in value from 150 to 300 per cent., forward the harvest from 14 to 20 days, improve the climate of the country, and add to the produce in a direct ratio to the higher value of the land" (*Journ. Royal Agr. Soc*., 3, 178).

In all these statements we have left the health of the country entirely out of consideration. But it is in evidence that undrained districts are the most unhealthy; and *vice versâ*. We have not room for the proof of this; those who are at all doubtful about it may be referred to Mr. Chadwick's report on the sanatory condition of the labouring population, where facts in abundance are produced, such as no man can possibly gainsay. So that the employment of the poor in draining land is not only productive of happiness, the reward of benevolent minds, and of wealth, so important to us all, but of health, without which satisfaction and augmented wealth would be of little service to anybody.

The reason usually alleged for not carrying drainage universally into effect is its supposed cost. "To drain," says Professor Johnston, "25 millions of acres at 6*l*. an acre would cost 150 millions sterling: a sum equal, probably, to the whole amount of capital at present employed in farming the land."

But this is a statement which must be taken with considerable modifications. In the first place, it would not cost 6*l*. an acre, on an average, to drain all the land of England; and in the next place, it need not be all done at once. On the contrary, it would be far better that it should be extended over many years. Indeed, in another place, Professor Johnston himself states that a Berwickshire farmer informed him that he "*drains so many acres every year*, and finds himself always repaid *by the end of the third season*. If, therefore, he has spare capital enough to go on for three years, *he can gradually drain any extent of land by the repeated use of the same sum of money*" (*Johnston's Lectures*, p. 447).

Supposing, however, there were, which there is not, any urgent necessity for the *immediate* drainage of all the land in England, the cost of 6*l*. an acre is much too high.

We find that in proportion as mechanical skill is applied to the manufacture of drain-tiles, the cost of draining diminishes. And it now appears from a statement in Mr. Pusey's very valuable report to the Royal Agricultural Society, on the recent progress of farming, that the cost of draining an acre of land in Huntingdonshire varies between 1*l*. 11*s*. 4*d*. and 6*l*. 6*s*. 8*d*.; the latter cost being necessary only in land of the heaviest kind, where the drains cannot be more than 16½ft. apart. And, upon the whole, *the average* cost of draining can hardly be estimated higher than 50*s*. an acre, even now; and by further improvements it will in all probability be reduced to a much smaller sum. These statements apply to tile-draining; but if sod draining is employed, it will not cost above 18*s*. 6*d*. an acre, according to the high authority of Mr. Handley; and we have Lord Spencer's testimony that this kind of draining requires, on clay land, very little renewing in 28 years (*Journ. Agr. Soc*., 3, 168).

We cannot too often repeat that the whole of this expense, be it what it may, consists in employing the poor, who must be maintained in degradation as paupers, if they are not supported in independence as labourers. And surely it is more wise, as it is more humane, to act towards them as has been done by the Duke of Buckingham, in the instance already mentioned, even if their employment should be attended with seeming loss. We believe, however, there is not a more mistaken idea than that of supposing a saving in labour to be a gain in money: just the reverse, within reasonable limits, is the fact. There is no real economy, but a great loss, in a niggardly allowance of labourers to either gardens or farms.

---

* "The Question, What can now be done for British Agriculture? Answered, in a Letter to P. Pusey, Esq." By J. Bailey Denton, Land-agent. *Ridgway*.

We could point, if we pleased, in proof of this, to a parish in Bedfordshire, consisting of 3,000 acres, where one farm of 900 acres employs more labourers than the remaining 2,100, and we will engage to say the profit per acre is very much higher on the 900 acres than on the remainder, thus proving that labour well applied creates wealth.

But our limits are already far exceeded for to-day, and we must content ourselves in conclusion with earnestly entreating gentlemen to realise the hope expressed by Mr. Pusey, that "the coming winter will not pass by without a vigorous commencement of under-draining throughout the country; for besides the benefit to the farm, draining, in its execution, of course gives great employment to the labourers,—and even beyond this temporary relief, every landowner who drains and then breaks up with the plough 25 or 30 acres of indifferent pasture, provides employment through future years for an additional family."

Mr. Blacker, of Armagh, has shown (*Quarterly Journal of Agriculture*, 13, 380), that an outlay of 2,000,000*l.* a-year on draining would keep every agricultural labourer from the workhouse; whilst the land reclaimed would "annually afford the additional demand for the labour required for its cultivation." We would recommend this gentleman's arguments to the consideration of landlords. Our own object is to attract attention in the strongest possible manner to the importance of doing the work, not to raising the means of doing it; although, if that were our purpose, it would not be difficult to show that long leases and corn-rents would instantly effect it here, as they do in Scotland. These, however, are considerations beyond our prescribed limits.

THERE is an article now coming into general use, called "Vegetable Ivory," concerning which we have had so many inquiries that we shall probably be gratifying our readers by a more particular account of it than we can give in the Notices to Correspondents.

The Ivory nut is the produce of a tree found on the banks of the river Magdalena, in that part of South America formerly called New Grenada, but now constituting the republic of Columbia. Humboldt and Bonpland found it at places called Barancas Vermejas, and Ibague, at the foot of Mount Quindiu, and also on the Rio Opon and Caño de Chucuri. The Spanish botanists Ruiz and Pavon also met with it in the groves of Peru in the hotter parts of the Andes, and named it Phytelephas macrocarpa; the Prussian botanist Willdenow changed the name, without sufficient reason, to Elephantusia macrocarpa—but his bad example is not followed. The natives of Columbia call it Tagua, or Cabeza de Negro (Negro's head), in allusion, we presume, to the figure of the nut.

Almost all we know about it is contained in the following memorandum, published by the Spanish writers above mentioned. "The Indians cover their cottages with the leaves of this most beautiful Palm. The fruit at first contains a clear insipid fluid, by which travellers allay their thirst; afterwards this same liquor becomes milky and sweet, and it changes its taste by degrees as it acquires solidity, till at last it is almost as hard as ivory. The liquor contained in the young fruits becomes acid if they are cut from the tree and kept some time. From the kernels the Indians fashion the knobs of walking-sticks, the reels of spindles, and little toys, which are whiter than ivory, and as hard, if they are not put under water—and if they are, they become white and hard again when dried. Bears devour the young fruit, with avidity."

The tree which furnishes these nuts is a Palm, although Humboldt and Kunth have referred it, for some reason with which we are unacquainted, to the order of Screw Pines (Pandanaceæ)—an error which is preserved by all botanists up to the present day.

Two species are known, the *Phytelephas macrocarpa*, or large-fruited, and *microcarpa*, or small-fruited.

The part of the kernel which is thus similar to ivory is what is called the albumen; that is to say, the nutritious substance which surrounds the embryo, and which is destined to feed it when it begins to grow. It is of the same nature, though not of the same consistence, as the flour of Corn, the spicy substance of the Nutmeg, and the meat of the Cocoa-nut, which, in other Palm-trees, becomes very hard—that of the Date Palm is quite as hard, if not harder; but it is not white enough or large enough to be worth using by the turner. The Doum Palm, or Forking Palm, of Thebes, the fruits of which are called gingerbread-nuts at Alexandria, has a similar albumen, which is turned into beads for rosaries; and our correspondent Mr. Murray informs us that he has a model of the Double Cocoa-nut, or Coco de Mer, beautifully carved from a portion of its own albumen, as hard as ivory, and susceptible of as fine a polish. He says he has also seen a figure cut from the same specimen, forming the end of the shaft of a lady's parasol, not to be discriminated from one carved in ivory.

A NEAT MODE OF TRAINING THE RASPBERRY.

THE Raspberry is in my opinion one of the best of our native fruits, and is valuable, not only during the season when it forms a part of the dessert, but also in its preserved state; when it is in great request for using in a variety of ways with which every housekeeper is familiar. On this account, I am desirous of directing attention to its cultivation, and of submitting the accompanying sketches, explanatory of a mode of treatment which I have seen practised with great success in various parts of England and Scotland, during the last thirty years; but which I do not remember to have seen described in any work on gardening, previous to my noticing it in one of the early Numbers of last year's *Chronicle*.

A glance at the sketches themselves, will give a better idea of the plan to which I allude, than any lengthened description can convey. I will, therefore, only observe that the plants are supposed to be placed in rows four feet apart, and about the same distance from one another in the row. The number of shoots on each is regulated during the growing season, no more being allowed to remain than the plant is capable of supporting. In most cases six or eight shoots will probably be sufficient; although, for fear of accident to any of them, it is sometimes desirable to leave one or two extra, which may be laid in if wanted, or cut away at this time, when the plants are usually pruned and put in order. Where this method is followed, a row of Raspberries in autumn will have something of the appearance represented in sketch No. 2; the arched portion tied to the stake in the centre being the canes which bore fruit this year; and which must now be cut down to the bottom, and be replaced by the upright shoots of last summer, trained in a similar manner to those represented in Fig. 1.—*M. E. H.*

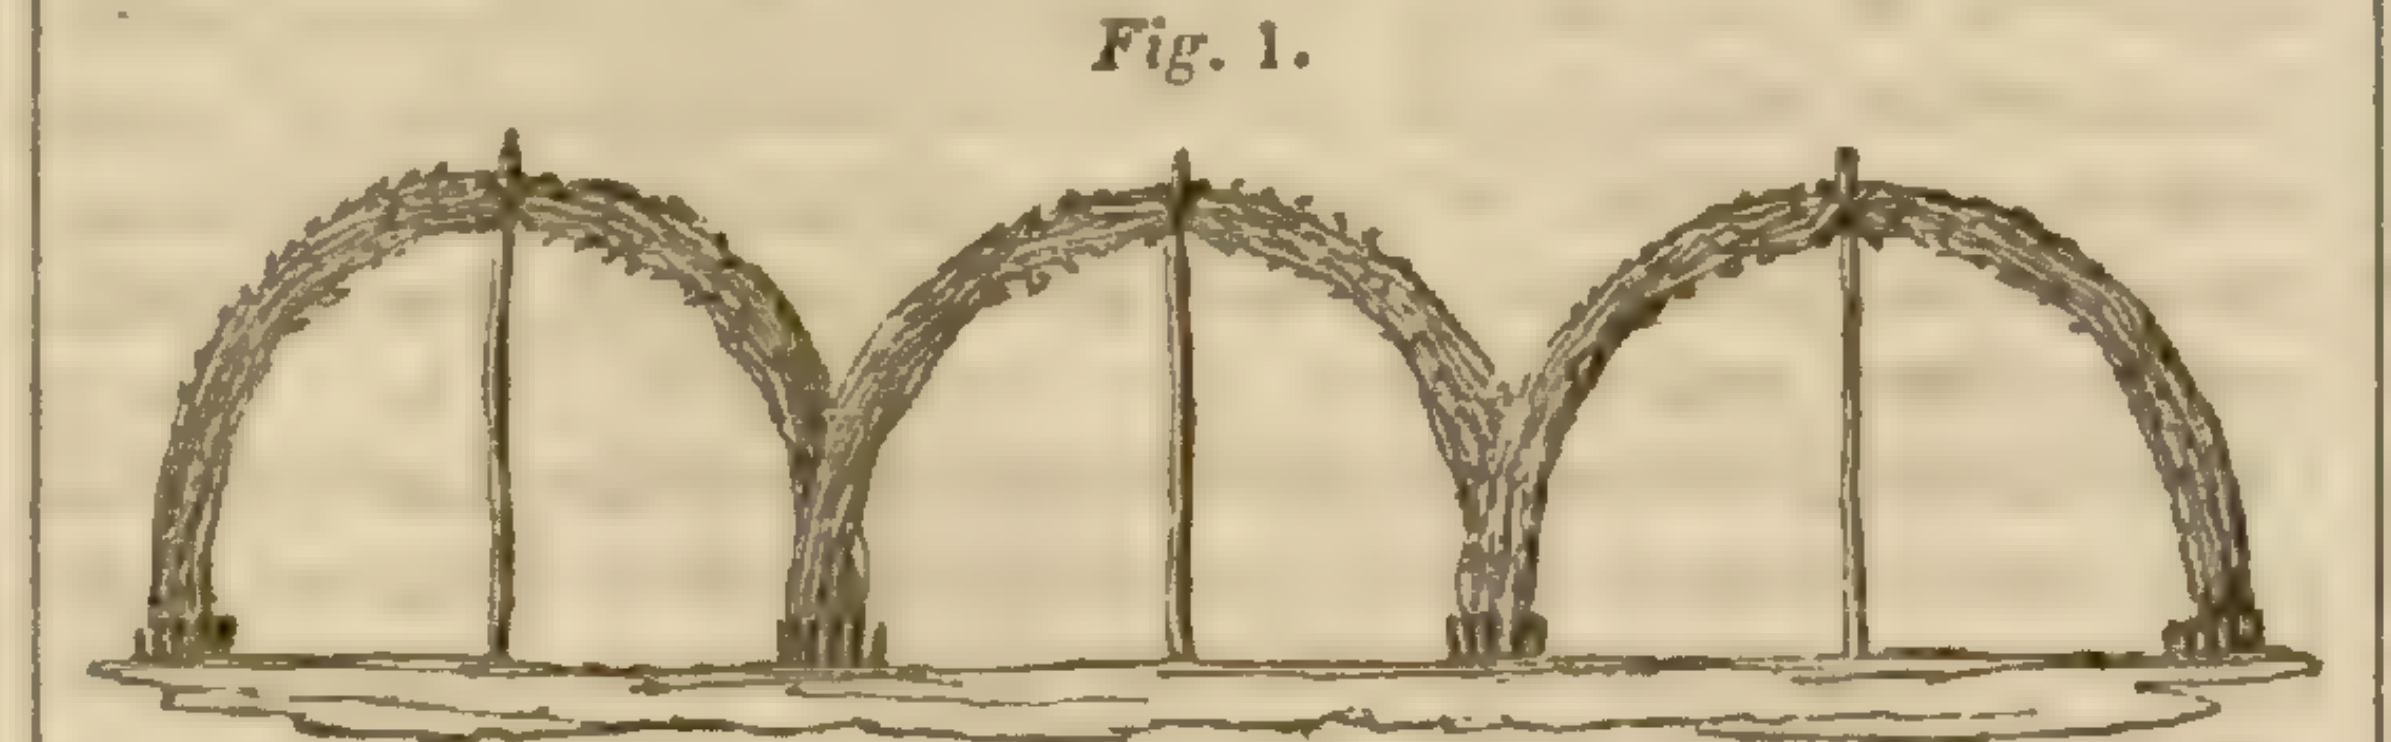

Fig. 2.

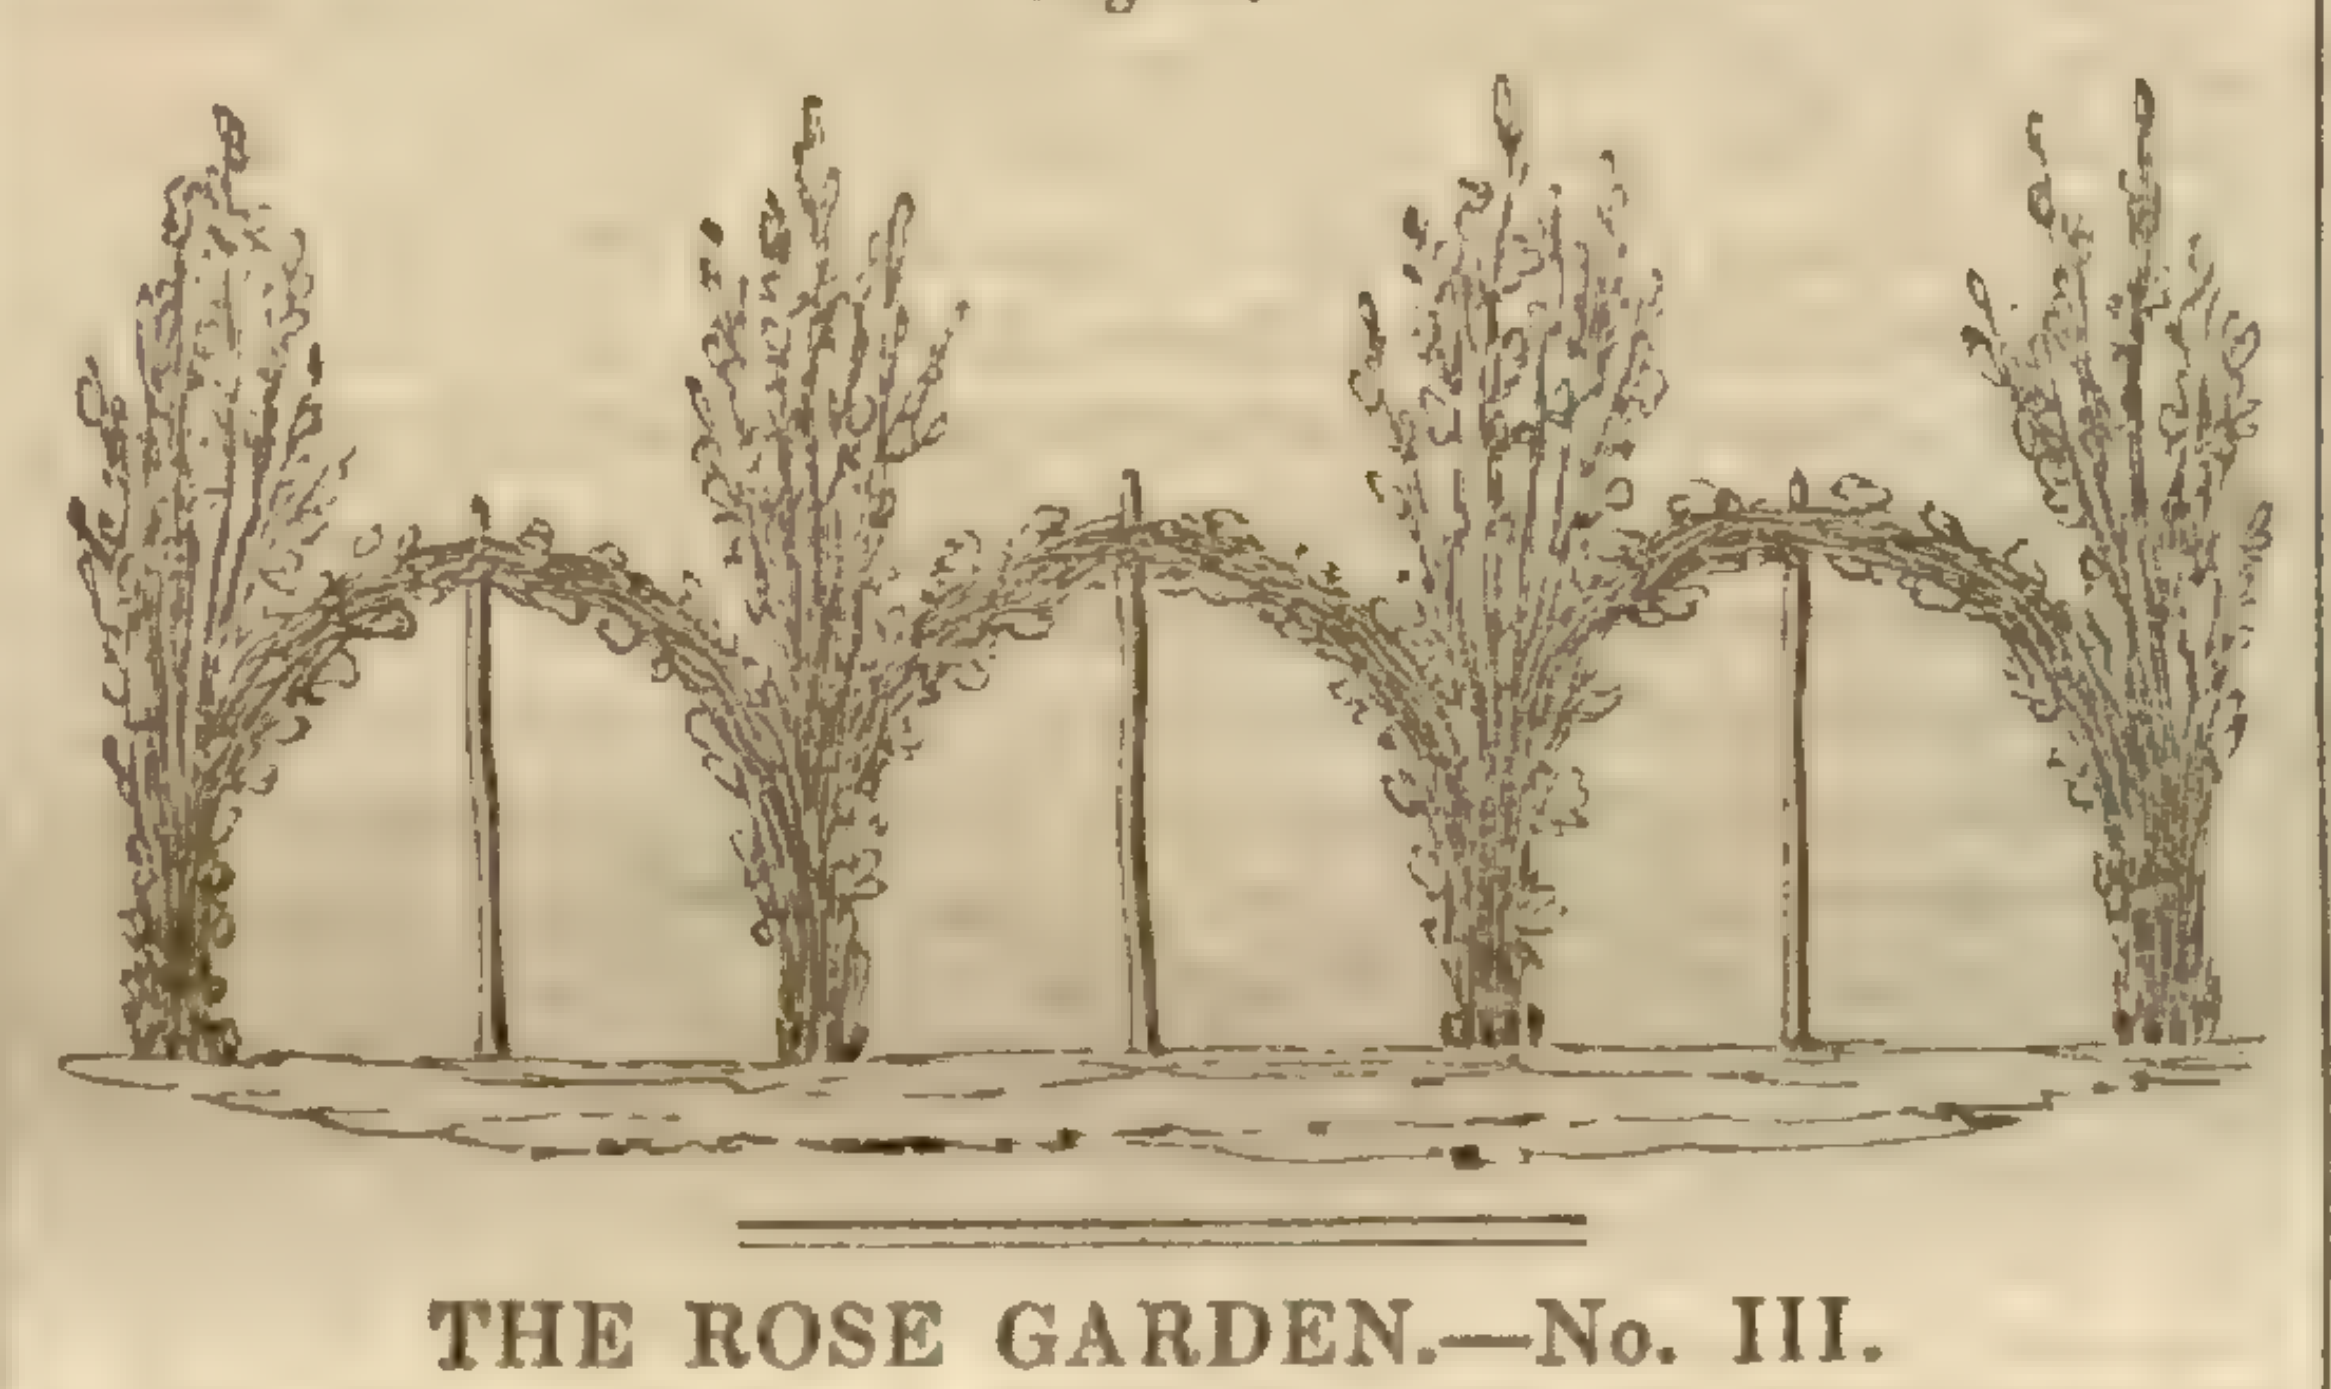


THE ROSE GARDEN.—No. III.

IT behoves every one at this season to look to the protection of his Standards; if Noisette, Chinese Tea-scented, and some of the more tender Bourbon Roses, they will all be excited by the present mild weather, as in December 1837, and in January we shall, perhaps, as then, be visited with a nipping frost which will deal destruction among them.

The mode of protection used in the north of Italy may be adopted; viz., that of surrounding the head of the Rose, after shortening its shoots, and binding moss or hay-bands round the stem, with an oiled paper cap. Such plants, however, often suffer by the early spring frosts, when uncovered. I have found no method equal to that of removing the trees, and placing their roots in a trench near a north wall, their heads leaning against the wall. A double mat should be nailed over them, which may remain on till the end of February, unless the season is very mild, when it should be occasionally removed. In this situation they will remain nearly dormant till the end of March, when they may be removed and planted in their summer quarters. By this annual removal, their roots become so fibrous that the plants receive scarcely any check, and bloom abundantly all the summer; and we shall thus be able to produce fine standards of Noisettes, Lamarque, and Jaune Desprez, which, since the winter of 1838, have almost disappeared. For the protection of dwarfs of the above and other tender Roses on their own roots, nothing is so efficient as moss placed thickly on the surface of the soil round their roots; this prevents the ground from being frozen hard; and although the extremities of their shoots may be killed, they will throw up abundantly from the stem near their roots, and bloom as well as if the whole plant had been protected.

Rose-seed, even of the most choice varieties, is abundant this season. The heps should now be gathered, and laid on the surface of the pots of mould in which it is intended that they should be sown. The pots should be placed on a sunny shelf in the greenhouse, and remain there untouched till the end of January; by which time the seeds will be thoroughly ripened. They may then be crushed with the fingers, and the seeds may be covered with about half-an-inch of light mould. The pots should remain in the greenhouse till the beginning of March, when they may be placed out of doors, in a situation fully exposed to the sun; when they will require to be watered in dry weather. They must be protected from birds and mice by a piece of coarse wire, such as is used for malt-kilns. A portion, probably a small one, will by these means vegetate during the first season, and most probably all will grow during the next. If the pots remain in the greenhouse too long, the plants will come up weakly and damp off, or become mildewed. In the open air, however weakly they are when they first make their appearance, they gradually acquire hardihood, and but seldom die. In June, during showery weather, they should be taken from the pots carefully with the blade of a knife, so as not to disturb the dormant seeds, and should be transplanted into a rich border.

Your remarks on the ridiculous mode of showing Roses in large bundles of flowers are very just. The end of exhibiting all flowers ought to be, to give the public a just estimate of their properties. A crowded bundle of Roses never can do this; five flowers and buds ought to be the maximum of number allowed for each variety. In this manner, a Rose may be seen fully blown, half-blown, in bud ready to open, and in buds showing its colour only. Some of the foliage belonging to each variety should also accompany the flowers.

The stimulus now given to growing Roses in pots will doubtless induce many to try their hands at this mode of cultivating the queen of the floral world. Additional vigour may be given to all the Chinese and other Roses of that family, by budding them close to the ground or on little stems of the Blush Boursault, Rosa Manettii, Brown's Superb Blush, or any other free-growing hybrid Chinese Rose. Z.

AMATEUR'S GARDEN.—No. LI.

IN the greater part of those small gardens which I have had an opportunity of inspecting, there is a want of variety in the selection of the plants with which they are ornamented. This is not the result of indifference on the part of the possessor, but arises from his not being acquainted with those things which are likely to suit his purpose, or not knowing by what names to ask for them. I have generally kept this in view in the arrangement of these weekly papers, and as this is the planting season, I perhaps cannot do better than point out a few good climbing or trailing plants to cover walls or arbours. It is not my wish to exclude from the garden of the amateur the more common climbing plants—for what is more beautiful than the Honeysuckle, the China Rose, the Jasmine, and the Ivy in certain situations?—but only to add to their number and to increase his enjoyment. The Clématis, or Virgin's Bower, includes several species of great beauty, which are particularly well suited for covering porticoes or arbours. C. montana produces large masses of white sweet-scented flowers in the early part of the summer; C. Hendersónii is also a fine free-flowering variety, producing blue flowers later than the preceding; C. Viticella and its varieties, of various shades of colour, are all very beautiful; and C. flámmula and grata, which scent the surrounding air with their numerous small white flowers in autumn. Newer than the preceding, but quite common in the nurseries, are two beautiful kinds lately imported from Japan: the one is called C. azúrea grandiflora, which, as its name implies, bears large blue or violet flowers; the other is named C. flórida-bícolor, or Sieboldi, and also produces large flowers—the outer petals white, the centre deep blue or purple. All these species are perfectly hardy, and are very beautiful when twined round a summer-house in a wild or natural part of the garden. Where a striking plant is wanted to cover a pole or chain, the Aristolóchia sipho might be chosen. It produces very large and uncommon-looking leaves, which generally attract the notice of a stranger; its flowers, however, are insignificant, and never seen unless they are carefully looked after. The Virginian Creeper, formerly recommended for the beauty of its coloured leaves in autumn, and the Vitis odoratíssima, are also well adapted for pillars and chains. The Rose, too, that "Queen of flowers," as the Editor justly calls it, will always be a favourite for such purposes. Such sorts as the Rosa ruga, De Lisle, Boursault, Bougainville, Noisette, and Ayrshire, are amongst the best, and look particularly well when trained upon three strong posts driven into the ground in the form of a triangle.

Where a flowering, climbing, or trailing tree is wanted to cover a south wall, there is nothing finer than the Glýcine sinensis; in the warmer parts of England it grows rapidly, and flowers most profusely in the months of May and June. It will bear any degree of cold in this country in winter, but evidently wants warm summers to ripen the young wood, by which it is enabled to flower freely.—*R. F.*

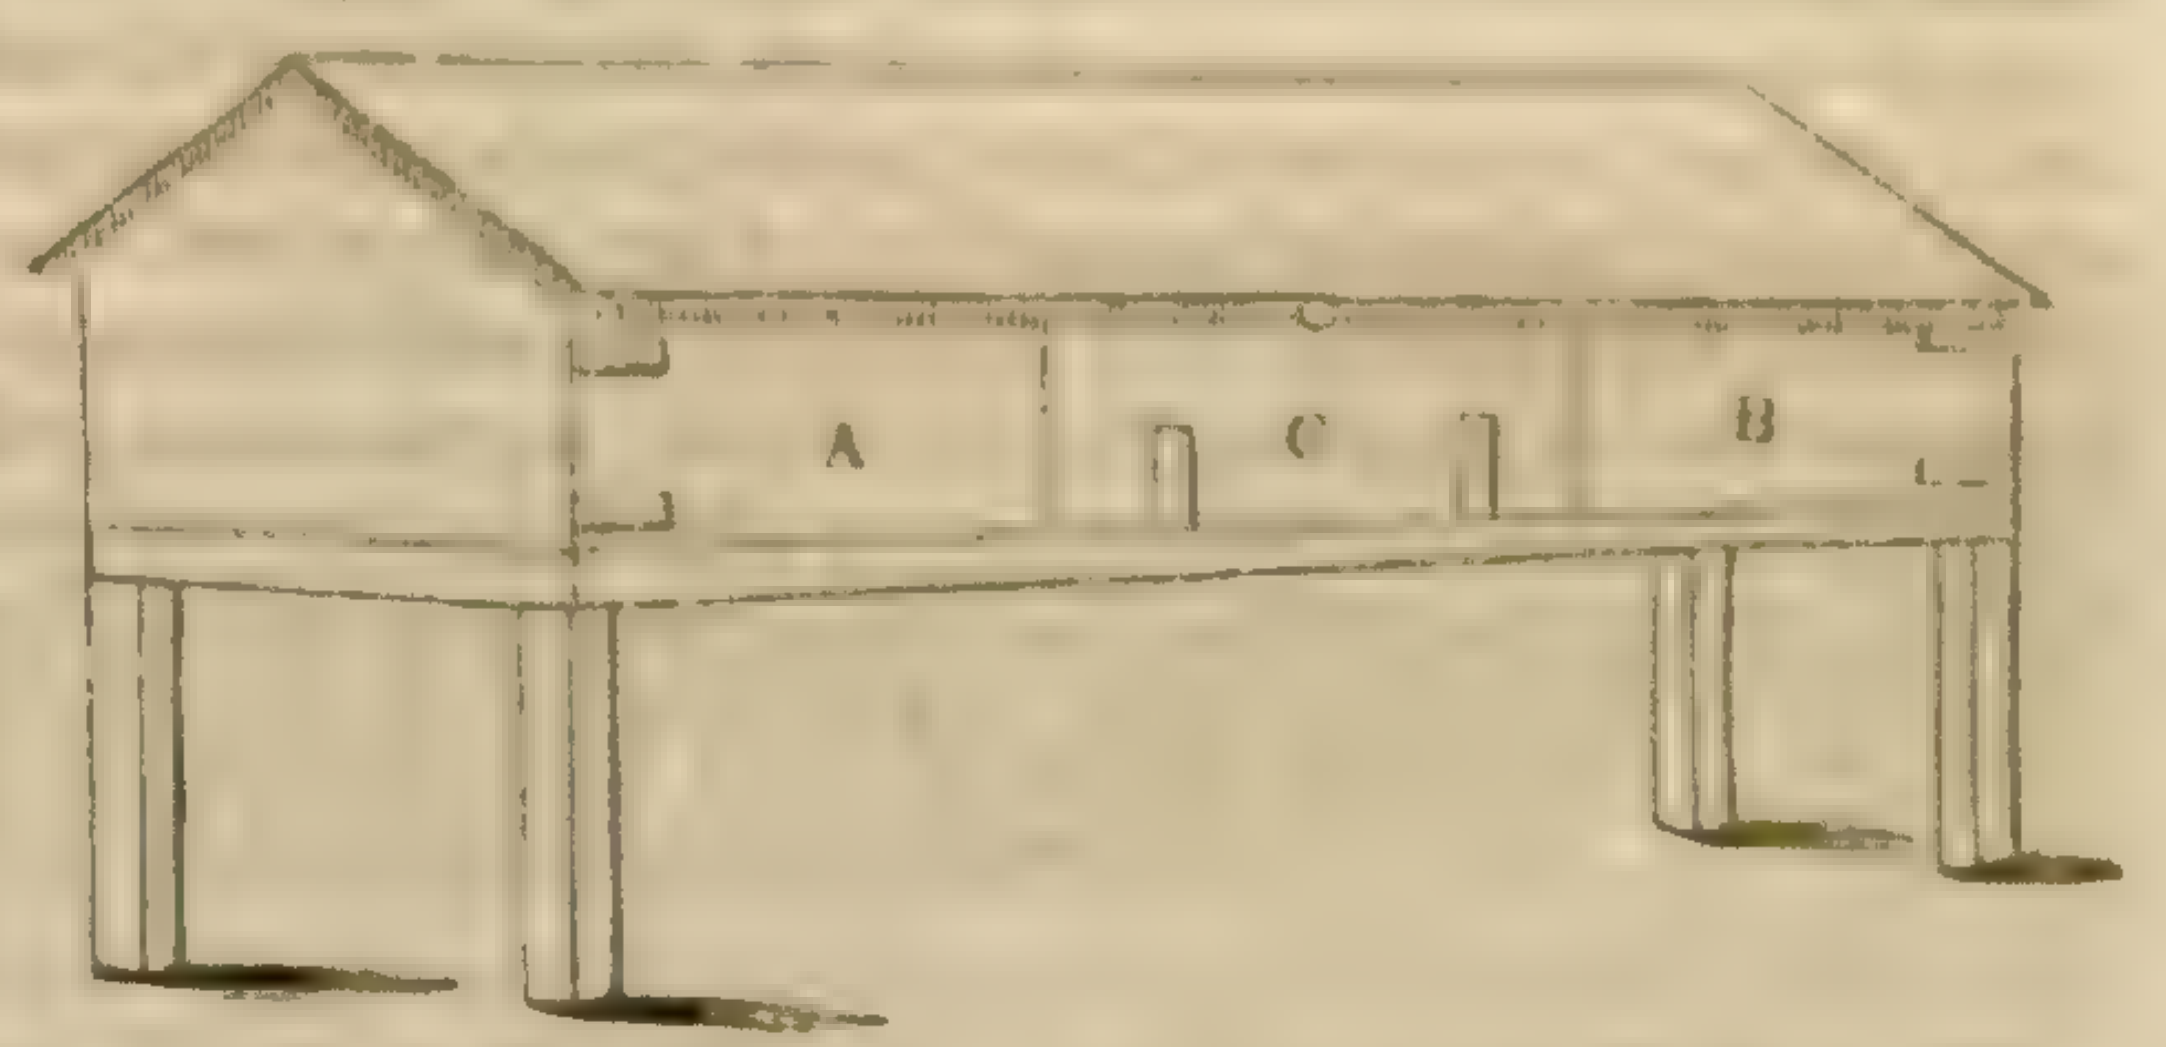
HOME CORRESPONDENCE.

A Problem in Cookery.—The question asked by "An Old Lady," p. 822, "Whether an inverted cup, placed in a tart, really saves the juice from boiling over?" appears to me susceptible of the following explanation:—The loss of juice which is almost always observed in a fruit tart, if it is made without a cup having been introduced, does not arise, in most cases, from the juice boiling over, but from its being absorbed by the crust. Some portion of the crust which lines the edges of the dish reaches down so as to come in contact with the juice, or so low that when the juice boils up it touches it; the consequence is, that it is immediately sucked up by the crust, in nearly the same manner as a little milk or tea at the bottom of a cup is absorbed by a lump of sugar put in afterwards. The introduction of the cup, as I hope to prove, prevents a portion of this absorption taking place, and when the dish is so full of juice that the application of the least heat would cause it to boil over, it may also perhaps prevent the juice from doing so, by forming for it a receptacle into which it can get even more easily than it could flow over the edges of the dish. We may generally trust to the evidence of "practical philosophers;" and in most cases, we shall find that all really useful contrivances adopted by the practical, may be easily explained by the natural philosophers. Indeed, the point in question is one which Natural Philosophy will easily explain, it being one of the many instances in every-day life where the "practical philosophers" have, without knowing it, availed themselves of the principles of science—I say, unknown to themselves, for I think that most probably the first time a cup was introduced into a tart, it was not with any view to prevent the juice from boiling over, or to form a receptacle for the juice, but merely as a mechanical support for the heavy crust which, when sodden with the absorbed juice, was very likely to sink down in the middle. Then some ingenious housewife bethought herself of placing a little cup inverted in the centre of the tart, in order to preserve to the crust its dome-like appearance; and, to her surprise, on cutting the tart and lifting up the cup, out ran the luscious stream which had been so unexpectedly stored up. That a quantity of juice accumulates in the cup, every one knows—at least, the "practical philosophers" know it; and, on a subject like this, who "can reject the evidence of the senses?" We all know—at least, I hope so—that heat causes solid, fluid, and gaseous bodies to expand; and that when a body is thus expanded by heat, there is less of it in a given space than there was before. Air is one of the most expansible of all bodies. Any one may easily convince himself of this by pushing a cork into the mouth of a common Florence flask or a phial, and then heating this over a lamp or a fire; in a little while the cork will be pushed out with great violence by the accumulated force of the pent-up expanding air. Another very common illustration may be seen in the bursting of Chesnuts when roasted, which is caused by the expansion of the air and moisture contained within them. Your readers must also know that when air has been heated in a vessel, and is afterwards allowed to cool, it will return to its original bulk, or to the space it originally occupied before it was expanded by the heat, and if air or something else cannot get in from without, we shall have an empty space left, or what philosophers call a vacuum. In the olden time, it was said that "Nature abhorred a vacuum;" this was absurd, but it is a fact that a vacuum will never remain if air or fluid can by any possibility get in. What I have just related may be proved, in a rough way, by continuing our experiment a little further: if, when the cork is blown out of the bottle by the expanded air in it, we take the bottle and invert it quickly into a basin of cold water, in a little while the expanded air will become cold, and as it cools it will contract to its original bulk; at the same time the water will rise in the bottle to fill up the vacuum which is being formed. We also see this exemplified in the common pump: the piston is drawn up; an empty space, or vacuum, is left above the water; the water cannot rise of itself to follow the piston—no more could it in our experiment with the bottle; but the pressure of the air on the outside being greater than that within (which expands itself to fill up the vacuum), in both cases forces up the water. But let us now see how all this applies to the case in point:—The cook makes her tart and puts into it the little cup; she puts the whole into the oven, the heat of which soon causes all the air, both in the dish and in the cup, to expand. Some of this latter must, therefore, bubble out and escape with the air of the dish through the crust or the hole made in it. When the tart cools, which it begins to do the moment it is taken out of the oven, air rushes in to supply the place of that which before escaped out of the dish, and would fill up the vacuum in the cup also, but none can get into that, because its rim is surrounded by juice. The pressure of the atmosphere, therefore, forces the juice into the cup (in the same way as it forces the water up into the pump, and, in our little experiment, into the bottle), where it remains stored up, instead of boiling over or being absorbed by the crust; though, of course, if the dish is very full of juice, either or both of these effects may take place, notwithstanding the introduction of the cup.—*A Young Lady.*——Allow me to suggest the following explanation afforded me by a learned friend:—That when the pie cools after having been taken out of the oven, the heated air within the cup contracts, and thereby occupying less room, allows the juice to be forced into it by the pressure of the external atmosphere. The cup, by sucking up the juice when the pie is in the oven, would evidently prevent it from boiling over; whereas, if it do so only when the the pie is out of the oven, I think that a virtue has been attributed to it which it does not possess. The positive solution of the problem would be obtained by baking a fruit-pie without the cup; in which case, if the juice did not boil over, the cause must be independent of the cup, and the reason is still left unexplained. I proposed to my wife to obtain the latter solution of the problem, but to no avail. "If," said she, "the cup were of no use, she, and those before her, had never made use of it; who, having most to do with such things, must know best?" She could not be guilty of innovation against a practice sanctioned so long by time and custom. That woman should thus debar man from the path of truth and knowledge! Perhaps the "Old Lady" may have less scruples than my wife, and from questioning the reason, proceed to question the cause likewise, and make it out for us.—*A Farmer.*——The better way for the "Old Lady" to determine whether placing an inverted cup within an unbaked pie will or will not prevent the boiling over of the syrup, would be from actual experiment. Since the days of Bacon, whenever philosophers set about accounting for phenomena, they begin by proving the fact. No doubt the "Old Lady" is a practical hand—an adept in manipulation, and well furnished with all the necessary apparatus. Let her, then, make two pies, and treat them in precisely the same manner—save that one has a cup inverted *secundum artem*, but the other not. Now, from theory only—utterly unskilled as I am in the mysterious craft of pastry-building, I judge that the cup will be found serviceable to a certain degree. That a great portion of the syrup is found confined under the cup is an undoubted fact, and is daily proved upon dissection; but most of this, I fancy, gets into durance after the baking, or rather boiling, is over—*i. e.*, during the process of cooling. When the pie is submitted to the action of the fire, the air under the cup keeps constantly expanding with the increase of temperature; indeed, if a portion did not escape under the edges of the cup, an explosion would ensue, discomposing to an alarming extent the whole piey structure—nay, possibly, dissipating to all corners of the oven not only syrup, but fruit, paste, dish and all. *The air upon expansion becomes more compressible*, and allows the syrup to rise within the cup, thus lessening the risk of waste from the increasing ebullition; but, as I said before, the greater part of the rise must take place during the process of cooling, as the confined air keeps gradually returning to its original bulk.—*An Old Gentleman, Tormshan.*——If the inquisitive "Old Lady" who suggests the inquiry would take the trouble of burning a piece of paper inside a tumbler or wine-glass, and then invert it in a saucerful of water, she will scarcely help being enlightened on the subject.—*Currant-pie.*——I have often had disputes at the dinner-table, particularly with my own family, respecting the use of a cup in a tart to preserve the juice from boiling over. They say, Only look what a quantity comes from underneath the cup, and it must be of use. I say it is of no use, as there is no juice under the cup till it is taken out of the oven. The air underneath, being rarified by the heat, expels the juice, if any is under; but, on cooling, it becomes condensed, and the juice is then forced under by the pressure of the air on the outside. However, to set the question at rest in my own family, I had two tarts made exactly the same, each having the same quantity of fruit, sugar, and water: a cup was placed in one—the other was left without one. Both were put into the oven at the same time, and received the same heat. When nearly baked, the juice was forced out of both; the one with the cup was the worst, and we were obliged to take out some of the syrup and reserve it till the tart was done and removed from the oven, when it was returned, and was of course found under the cup. This is a proof that the juice does not get under the cup till the tart gets cold, as the whole of the juice was drained from the tart. The cup also takes up room, and it appears that the juice boils out worse with it than without it.—*J. F. D.* [We have to thank a score or two other correspondents for their complaisance to our "Old Lady," for which we here return her very best acknowledgments.]

Weight of Poultry.—I beg to inform your correspondent who wishes to know the weight of poultry, that a common weight for Aylesbury ducks, between four and six months old, without having been fattened, is from 4 to 4½ lbs. in feathers, and fasted before killing. I last year killed a drake which, at nearly six months old, weighed, in the same way, 4¾ lbs. I always keep my poultry well, so that they are fit to kill at any time; besides which, it causes them to produce a large quantity of fine-flavoured eggs. Two ducks have laid upwards of 150 in one season.—*J. C.*

Parsneps, as Food for Pigs.—Whilst staying in the Isle of Guernsey for a couple of months in the summer of 1841, I was much pleased with the peculiarly fine flavour of the pork, being sweet, juicy, firm, and beautifully white, at a season of the year when that unclean animal is thought not to be in the highest perfection. This superiority in flavour and appearance is attributed to the plentiful supply of raw unwashed Parsneps with which the animal is fed. In confirmation of a universally-admitted fact, I beg to send you the following extract from a lately-published history of the island and its products:—"Hogs prefer raw Parsneps to all other roots, and make excellent pork when fed upon them; but the boiling of the root renders the bacon flabby. By this food the animal can be fatted in six weeks. Too much can hardly be said of the beef and pork fatted on Parsneps. At this time (July 17th, 1840) there is in the Guernsey market a porker, 22 months old, weighing neat 750 lbs. English, which has never eaten anything but raw Parsneps and sour milk; finer meat never was seen. In the use of Parsneps, one caution is absolutely necessary: they are never to be washed, but to be given as they are taken up from the ground. Used in that way, they are found not to surfeit the hogs and cattle, and to fatten them better and quicker than they otherwise would. If washed, they are apt to satiate, and, as the farmers say, will never thoroughly fatten them. An ox will eat 120 lbs. per day, exclusive of hay." I regret, in justice to the author, that, when I copied the above extract for an agricultural friend in England, I did not add his name; but as the *Gardeners' Chronicle* is universally read, I am sure he will himself furnish you with it, if it should be required. I think the above will be considered an improvement on "Lusor's" favourite root, the "Mangel Wurzel," as, being hardier, it will require no pitting, and consequently there will be no danger of frost entering the heap, as stated by him at p. 806, and leaving a certain thickness of decay on its departure.—*Philo-Chronicle, Regent's Park.*

Bees.—The time is now fully arrived for what may be called "hybernating" bees, and, from the experience of last year, I can confidently recommend the system. Having heard something about burying bees during winter, I had a brick pit made, and having weighed 2 skeps or hives, I put them into it in the last week of November. They were secured against the attacks of rats and mice, or the inconvenience of bad weather. I examined them occasionally, to see that they were safe; and in the month of April, when the solar influence began to open the flowers of spring, I released them from their prison pit, and put them on their former berths again. The perforated zinc plates which were in winter put before their doors were removed, and they instantly poured forth in clouds, rejoicing in their liberty and the sun's rays, appearing as vigorous as giants refreshed by sleep. At night, I exchanged the bottom boards for clean ones, and found the old ones covered with mouldy dead bees, and other offensive matter. On being weighed, the skeps were found to have lost but little honey for so long a period, compared with what they would have done under the old system. The swarming took place in May: one swarm was put into a house, on Nutt's plan; one in a box, after the plan of Payne, of Bury; and one in a box, after the plan of Savage, of Swaffham. All three did admirably, and from Nutt's box I got some excellent honey. The reasoning or *rationale* of this is self-evident to every apiarian. People do not usually eat when they sleep: *ergo*, Bees, being kept under the influence of the Poppy God from November till April, have, on waking, abundant stock of food to invigorate them for the fresh labours of the new year. In conclusion I will now observe, that as there were two objections to my pit of last year—viz., damp, and being placed next a walk by which there was constant traffic,—I have this year made them a dormitory, as under, and have placed them next a lofty north wall, in a remote part of the garden. I now feel assured that all things which can in this way be achieved for their success are done for them.



The two shutters at either end, A and B, open by hinges right and left, and are secured by the central shutter C, which falls down, and which has a hasp or padlock at top to lock it up. Thus the whole can be inspected and closed again in the easiest method, without noise or disturbance. *W. Mason, Necton, Norfolk.*

Destruction of Wasps.—I am glad you repeated my experiment with the vapour of spirits of turpentine on the wasps. I have since had other opportunities of testing its utility, and I find that it is quite certain wherever the entrance-hole can be closed. Where the liquid cannot be conveniently poured into the hole, perhaps the mere wetting of the inside of a flower-pan with the turpentine, and placing it over the hole, will be found sufficient. I once saw a swarm of bees destroyed by half-filling a washing-basin with chopped Laurel leaves, and then, at night, placing the hive over the basin. Every bee was dead before morning. Bruise a young Laurel leaf, place it under a wine-glass with a wasp or fly, and in two minutes the insect dies.—*J. S. Henslow.*

Bees.—Encouraged by the kindness with which you treat the applications of all who stand in need of information, I venture to lay my case before you, hoping that my difficulties may be solved by some of your correspondents who are learned in Bee management. On the 12th May, 1841, I stocked, with a strong swarm, a nice hive, made with side boxes, &c., on Taylor's plan. The bees soon filled the central box with comb, yet made but little honey during the summer. From ignorance I did not feed them in the autumn, and being told that bees in boxes always died from cold, I wrapped them up in garden mats, and in December they were as strong and brisk as if it had been June. According to Nutt, I stopped the mouth of the hive, when the frosts began, with a perforated piece of zinc, and surrounded the whole hive with straw. On my return after a short absence in January, I found my poor bees in a sad condition; the smell of the hive was intolerable, and upon reference to my books, I concluded they had the dysentery. I lifted them and changed the foot-board, feeding them *daily* from that time until April with honey, in a feeding-pan placed at the top of the hive. They soon recovered, and were so lively that the hum and bustle in the hive was as great as in summer. I read in Bee-books that bees lie dormant in winter; mine never do—they consumed 12 lbs. or more of honey, but as I take pleasure in my bees, I did not care for that, particularly as I hoped to reap some little return during the coming summer; but, alas! my hopes were vain. Early in March they began to collect pollen, and on the 24th of May the thermometer in my hive ranged from 85° to 100°. I placed a large bell-glass on the top, with a piece of comb to tempt my ungrateful bees into it; at the end of a week they entered in numbers, built a piece of comb, and *I* was elated. Still the thermometer was very high; I could with difficulty keep it under 100° by shading, &c.; but I would not open a side box, because my books told me that if I did so, they would desert the glass, which I had set my heart on having filled. A large mass of bees almost filled the glass, but the piece of comb did not progress, and the collecting of honey was at a stand-still, so that I began to have my misgivings that all was not right; nevertheless, I saw no clustering about the foot-board, nor hanging out of the hive, which, the *books* say, always precede swarming; neither did the thermometer rise suddenly, but ranged steadily from 95° to 105°. This continued till June 7th, when, on going to my bees about 10 A.M., what was my dismay on finding the bell-glass deserted, and the hive nearly empty! In answer to my anxious inquiries, I found that a swarm had been seen in the air about 8 A.M.; but I never heard more about it, though I caused the most diligent search to be made all round the neighbourhood. In a short time the bees again increasing in number, and the thermometer being very high, I opened first one and then the other side box, fearing lest they might throw off a swarm; this, however, they did not. In the course of the summer, a little more honey was collected, and, as far as I can see through the window, a good many cells seem full. In Aug. they killed the drones in thousands; during Sept., Oct., and Nov., I gave them in all about 6 lbs. of the best honey, and last week I removed them, according to Cotton's plan, to a dark garret. I found their weight to be 28 lbs. including the hive, the exact weight of which I know not, but guess it to be about 12lbs.; so that, after two years' expectation and care, and providing them with nearly 20lbs. of good honey, I find about 16lbs. of comb, honey, and bees in my hive! This is certainly neither profitable nor encouraging. Now, if anybody will kindly tell me in what way I have mismanaged my hive, I shall feel greatly obliged; for I wish to be very fond of bees. What errors have I committed, and how can I do better for the future? Another difficulty is, that things which are spoken of in books as easy matters of course, I find almost impracticable. For instance, I am directed to lift up, examine, and weigh my hives in the beginning of September! Now I believe that I have as much courage as my neighbours, but I find it rather a fearful undertaking to do this in December, when my little irritable friends are comparatively in a state of quietude. I also find, "that the thermometer in the hive must not rise above 90°." The last summer was certainly a hot one; but with a good thatched roof to my bee-house, and a canvass awning which kept off all the sun, with both side boxes open, and all the ventilators out, and even with wet clothes wrapped round my hive, it would and did rise often to 110° or 115°; and, of course, had either of the side boxes been full, it must have risen higher still. Again, I am told, that in November, the bees being fast asleep, I am on no account to disturb them, though I am then to take up the hives, weigh them, tie them up in a cloth, convey them to a dark room, or bury them. Now I find, that though on a cold day they may be torpid, yet the slightest movement, even opening the little shutter, brings them to life again; and it was not without much difficulty that I could effect my movement the other day, the whole hive being in an uproar the moment I began to touch it. They have scarcely become torpid since; and if they remain lively, must I not feed them, in spite of the prohibitions of the books? The books which I have got are Nutt's, Taylor's, Cotton's "My Bee-book," Huish, and "The Naturalist's Library." In the construction of hives, too, I find a sad discrepancy between theory and practice: the slides and contrivances so much landed in Bee-books, and by which so much is to be effected, I find, when I want to use them, invariably glued up with propolis, and immovable without hammer and chisel. Such, dear sir, are some few of my difficulties; and if you can find room for even a short answer to comfort and instruct me, in a spare corner of your invaluable Paper, you will greatly oblige—*A despairing Bee-Keeper.* —[In the name of common humanity, we entreat some kind person to put our fair, and very clever, correspondent out of her misery.]

Effect of Sulphur on the Red Spider.—I have tried the effect of sulphur upon the red spider by placing a leaf covered with that insect in a tin basin, 3 feet long by 2 feet wide, and 2 inches deep, which basin was fixed over a strong fire for 5 days; at the end of that time the red spider appeared to be in perfect health, although the plants, at the distance of 3 feet from the sulphur, lost all their leaves, on account of the heated steam.—*A Constant Reader, Southampton.*

Information for Cottagers.—I advise cottagers, for the benefit of their small gardens, to take every opportunity in their power of collecting the leaves so often seen blowing about the roads and fields, and to deposit them in a corner of the garden, securing them there with mould, road-dirt, or any such substance as they can most conveniently get at. Instead (as is too often the case) of throwing into the ditch all their soap-suds, and what is termed dish-water (which, although not very greasy in the cottage, is still beneficial to the soil), they should pour them over their compost-heaps; by this simple means, they will procure for their crops a wholesome manure without much trouble or expense.—*R. A., Charlton Kings.*

Russia Leather.—A gentleman who had resided some time in Russia endeavoured a few years since, when the duty was 15*s.* per hide, to prepare this article in England; and for this purpose he imported some Birch oil. He succeeded in giving the odour, but in consequence of the want of continued sunshine the oil left stains, as though tar had been employed over the surface of the skin: it was also found that the hides of this country, being much stouter, would not bear to be shaved down like the smaller and finer hides of Russia. Another reason why the manufacture was not attended with profit was this:—the Russia leather is only used in this country for fancy purposes, which require a fine grain and perfect evenness of colour; and it turned out, that from 100 hides prepared with the Birch oil, only a dozen were fit for Pocket-books, &c. In Russia the whole of the hides are dressed with the oil, and the tanners are consequently enabled to select from a vast number the hides required for the English market. The whole number imported into this country does not exceed 5000 or 6000 annually, which are probably selected from more than 100,000. The present duty is four-pence per lb., each hide weighing 7 to 10 lbs.—*I. G.*

Experiments with the Potato.—Having seen some observations in the *Chronicle* relative to the cultivation of the Potato, I venture to submit the following result of my success in the growth of a few sorts during the last two seasons. In the spring of 1841, I had one tuber of each of the following sorts, viz., Quebec Shaw, Painted Lady, and Mangel Wurzel Potato, cut into sets, and planted in rich soil, with a little half-decayed litter put over them before the earth was filled in. This was all the attention they received, with the exception of sufficient earth to prevent the tubers from being discoloured by the light. When taken up they yielded as follows:—

Quebec Shaw Tubers, 162; weight 76lbs.—12 weighed 17lbs.
Painted Lady ,, 113; ,, 39 6 ,, $6\frac{3}{4}$
Mangel Wurzel ,, 204; ,, 92 12 ,, 23
The three Potatoes produced 479 tubers, which weighed 207lbs.
The Painted Lady was hurt by being grown over by the others.

This season I planted a whole Potato of the Shaw kind in rich soil, and earthed it well as it grew, but without burying the haulm, with a view to induce it to produce tubers. I took up from this root more than 150 tubers, 80 of which were serviceable; the whole weighed 46lbs. In consequence of an advertisement in the *Chronicle*, I bought half-a-gallon of a sort called "Knight's Earliest Known." Some I cut, and some I did not, according to the size. The only pains I took with them was, to give them a good watering once or twice, and to mulch them well to keep them moist. The crop, when taken up, weighed 145lbs.—more than 40 times the weight of the sets. Two bushels of them were the handsomest Potatoes I ever saw; similar in shape and appearance to the Fox's Seedling. I also planted this season 19 cut sets of the Hen's-nest Potato, which grew without any extra pains: one root weighed 15lbs., and the total weight was 88lbs.—*Charles Austin, Beddington, Surrey.*

To keep Ice.—At p. 845 of last year's *Chronicle*, I observe that Mr. G. Aitken has briefly stated the manner in which ice has been preserved by him through three succeeding hot summers, without the protection of an ice-house, by raising a conical heap of such dimensions as may be thought necessary. The situation which he adopts is dry, with a slight slope, and shaded, but not covered with trees. To this I agree; but he does not state the manner in which the heap is to be raised. Allow me, then, to lay before your readers a plan, on the same principle as that of your correspondent, which I have seen practised with success, and which affords us an ample supply of ice until the return of frost. A situation should be chosen as stated above, upon which you may form your heap of any required size: throw the ice regularly thereon, break it very small with mallets, and tread and beat it firmly together To every layer of ice add one of snow, which will render it more compact, and water the snow well with a watering-pan; then beat and tread it again, according to the foregoing directions. Continue this process until you reach the apex, remembering that it must be of a conical shape. After the structure is finished, allow it to remain for eight or ten days exposed to the inclemency of the weather; by so doing, the atmosphere, if damp, will congeal the whole into one solid mass of ice. Let it afterwards be thatched in the same manner as a corn-stack: barley-straw is preferred for this purpose, being thought a better defence against the heat of summer; but it will require a stratum at least from 16 to 18 inches thick, which should be well secured with straw ropes. Lastly, adopt Mr. Aitken's plan of making a steep roof with tall drawn-up trees; to which rafters should be nailed, to be afterwards closely thatched with Spruce branches.—*A Ross-shire Gardener.*

The Culture of Pine-Apples.—At p. 805 of the *Chronicle*, Mr. Hamilton calls the attention of your readers to a novel mode of Pine-apple culture; which, although, not new, I consider excellent; and Mr. H., for reviving the above, justly deserves to be commended. In justice, however, to T. A. Knight, Esq., who when living was the first to grow Pines on the principle mentioned by Mr. Hamilton, who, in short, always grew them on the old stools, without tan or other fermenting matter, I must beg to refer him to the *Gardener's Magazine*, Vol. II. p. 368, where he will find an account of the mode of cultivating the Pine-apple as practised at Downton Castle. I will now content myself with extracting a few passages from a letter from Mr. Lauder, Gardener at Downton Castle, inserted in the same article. "In compliance with your request, I have great pleasure in stating the mode of Pine-culture practised here. In the outset I must remark, that the present practice is exactly the same that Mr. Knight commenced with, and that it has years ago been recorded in the Transactions of the Horticultural Society. As soon as the plants show fruit, the strongest sucker is preserved; all the others being taken off as they appear. When the fruit is cut, the plant is taken out of the pot, with as many roots as can be removed with it; all the leaves, except four or five on the top of the stool, are scaled off; the leaves are also scaled off the base of the sucker, in the usual manner. The sucker, however, remains growing on the stool, until in its turn it becomes the parent plant, producing fruit and suckers, and undergoing the same operation as its progenitor whose place it is to occupy. The few leaves left on the top of the stool are, as they become matured in the course of the season, plucked off; so that the whole stool, being entirely covered with earth, produces abundance of young roots which continue to supply the rising plant with additional nourishment, independently of that obtained by its own immediate roots, until it has performed its office, &c., &c." The writer then goes on to state the form of the pots and the mode of draining, the compost used, and that the plants, when potted, were placed in a temperature of not less than 100°; and that when the house was kept at that height, a great deal of water was given freely to the root, so as to reach the bottoms of the pots. The Pines were never moved out of the pots in which they were first planted; and at all seasons, excepting in the depth of winter, the house was kept in a state of humidity, &c. This part of the letter I have extracted, to show that Mr. Knight was the first we have heard of who grew the Pine-plant on the old stools with success, as the letter above quoted will show.—*Edward Morse.*

Effect of Animalcules upon Water.—Your Correspondent "W. S. B." inquires the cause of his pond becoming suddenly green before rain. This is not an uncommon appearance, and it undoubtedly arose in this case from the presence of infusory animalcules. The species which most commonly produce this appearance are the Chlamidomonas pulvisculus, and the Euglena viridis of Ehrenberg: there are, however, many others which produce the same effect. Some of the infusoria produce other colours in water. A beautiful pink or rose colour is produced by species of Astasia and Monas, an orange by the Stentor æneus, and a yellow or reddish colour by the Gaillonella ferruginea and by some species of Navicula. An orange-coloured water is also produced by the water flea, Daphne pulex, when in large numbers; and it is now known that the red-snow—so often thought to be of vegetable origin—is, in many instances, entirely owing to the presence of animalcules, and their ova, of two species of the genera Astasia and Philodina. The causes of the sudden appearance and disappearance of animalcules in water are a curious subject. I have kept all the above-named species, without being able to discover the causes that sometimes called them into life and activity, and again suddenly destroyed them; so that they formed a coating of colouring matter on the sides of the vessel. All animalcules that colour water form, when they die, beds of colouring matter at the bottom of the water in which they have lived.—*E. Lankester, M. D.*

Bletting.—I entirely agree with you that it is very convenient to be in possession of a word which signifies exclusively the kind of ripeness of which fruits of the Service genus are susceptible, and we thank you for enriching our vocabulary with so good a term. Still the change in the maturation of these fruits must differ materially from the *blettissement* of the pomaceous fruits, though M. Decandolle could not find any expression in common use to answer his purpose better. The French *blette* undoubtedly means the kind of decay which commences in the heart, and proceeds outwardly, of which the rapid degeneration of the Jargonelle is so good an example, and so inconvenient an instance. This *blette*, or *espèce de pourriture*, the common people of Sussex call *drocksiness.* They apply it to Pears especially; and then, but less frequently, to Apples and Turnips, as they approach the same state of decomposition: over-ripeness, mealiness, and loss of flavour being the first indications of this sort of change. I have no doubt that the word is from the Saxon dros or droslick; the position of the consonants being reversed, as frequently happens in their pronunciation of such words as Waps, Haps, for Wasp and Hasp, and the like. Drossiness and feculency are certainly the character of this kind of degeneration. But the bletting of the Medlar will never be confounded with the drocksiness of the Pear, though both are next-akin to rottenness.—*P. P.*——In the *Vocabulaire* which gives the roots of words, we have the following derivation of this word:—"Blette, s. f. (*βλίτον, espèce de légume insipide*) plante. Adj. *Poire blette*, molle et presque pourrie." The signification of the adjective above, taken conjointly with that of its root, seems strongly to warrant the application of the term bletting to the Medlar, &c.—*I. K. S.* [Βλιτον is supposed to have been the plant now called Amaranthus Blitum, still used in France as a bad sort of Spinach.]

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Evening Meeting, *Dec. 8th.*—The Duke of Richmond in the Chair.—Dr. Lyon Playfair commenced his second lecture. He stated that in the last lecture he had examined the nature of the food of animals; in this evening's lecture the process of growth and fattening in animals would be more particularly considered. The health of an animal depends on the supply of nutriment being equal to the waste that is going on in the body. Healthy adult animals weigh as much at the end as at the beginning of the year, and this depended on their having had enough food to supply the waste going on in the system. In young and growing animals it is somewhat different; they require more supply than there is waste, because their bodies are constantly increasing in size. When animals are first born, the functions of organic life are chiefly performed. Respiration is at this time more active than in the adult. Nutrition is also more active. The food that nature supplies animals with at this period of their life is well adapted to assist those functions. In the milk of animals is found nitrogenised matter for developing the system, and carbonised matter for supplying animal heat. The following is an analysis of the milk of a woman, a cow, and an ass, made by Dr. Playfair.

	Woman.	Cow.	Ass.
Casein	1·5	4·0	1·9
Butter	4·4	4·6	1·3
Sugar	5·7	3·8	6·3
Ashes	0·5	0·6	—
Water	88·0	89·0	90·5

The casein is the nitrogenised principle which affords nutriment to the muscular and other tissues. This is in greatest quantity in the cow. The butter and sugar are the combustible materials which by their combustion supply heat to the body. The ashes consist of phosphate of lime and common salt, both of which materials are necessary for the healthy function of the body. Thus, in milk we have all that is necessary for the growth of the body, and it is the type and representative of all food; for unless food contain the principles of milk, it is not fitted for the purposes of the body. Casein is the principle of cheese. In its ordinary state, as made for the food of man, cheese contains both casein and butter. The stomachs of young animals are not adapted for separating the nitrogenous principles from food, and the casein of milk is supplied to them ready separated. In the young ruminant, as the calf, the three first stomachs into which the food of the adult animals enter before it is digested are not used at all. The milk passes at once into the fourth stomach. Hence the necessity of weaning these animals gradually, in order that their stomachs may be fully able to prepare the raw food for digestion. All food for weaning children, also, should be prepared on the model of milk, changing the relations of the nitrogenised to the carbonaceous materials only as circumstances require. In the milk of the cow the carbonised materials are as two to one, but in the food of adult animals they are as six to one. The large quantity of casein in milk is required for the rapid development of the body; the butter, a highly-carbonised material, is required for supporting a large amount of animal heat. It is, consequently, a bad thing to feed calves on skim-milk, as the butter and casein have been removed, in the shape of cream. Earl Spencer, who is very successful in weaning his calves, feeds them first with new milk, then with skim-milk and meal, the meal supplying the necessary azotised and unazotised materials (azote and azotised are synonymous terms with nitrogen and nitrogenised). In feeding young animals, as well as young children, they should have good food, and there should be no stinting them as to quantity. That farmer will lose in the end who thinks to save his milk by stinting his calves. Artificial food is sometimes made and used as a substitute for milk. The Duke of Northumberland employs a mixture of treacle and oilcake, bruised flax, and hay. The fruit of Leguminosæ contains casein; hence we may infer that Peas and Beans would be good food for calves. The difference between casein and albumen is, that the former is much more soluble than the latter, and probably on that account more adapted for young animals. Beans and Peas are known to be good things for growing pigs, whilst Barley-meal is good for fattening them. In the growth of young animals, as well as the fattening of adult ones, all exposure to cold should be as much as possible avoided. Cold diminishes the vitality of the body, and whatever diminishes vitality gives a preponderance to chemical action in the body, and injury of some kind is the result. Exercise is also necessary for the rearing of young animals, although it should be avoided in fattening. In order to develop the calf and the lamb, they should be allowed plenty of exercise; but in fattening another object is to be gained. All motion consumes something in the body; therefore motion is so much loss of material in the fattening an animal. In the same manner, exposure to cold, as was proved by the experiments repeated in the last lecture, was a positive loss in the fattening of animals. Stall-feeding is beneficial, both on account of warmth and quietude. The primary cause of all this waste is the supply of oxygen; whatever increases the supply of oxygen increases the waste of the body and the necessity for supply. Fatting animals are often kept in the dark. Darkness favours sleep, and sleep quietude. It was thus that darkness was favourable to fattening. A case was related of a pig that was placed in a box in the dark, and the sides stuck full of pins, to prevent the animal moving in any manner, and the animal quickly got fat. The fattening of ortolans in Italy illustrated this point. The ortolan is a bird that takes its food at dawn of day, and the breeders of these birds take advantage of this, and shutting them up in a dark room, they contrive to let in the light four or five times a day, and to supply the birds with plenty of food. The birds, at every admission of light, thinking the time is come to eat, take their usual quantity of food, and on the light being withdrawn they fall asleep, and in this manner they rapidly get very fat. Sleepy, good-natured pigs fatten fast; but active pigs, as the Irish, never get fat at all. A question may still arise as to whether it is better to feed animals in stables or small yards. The manure of the latter is stated to be better, and there is no doubt of this, but then the gain of the manure is lost in the fattening of the animal. Manures will also vary in value according to the food animals take. The manure furnished from cattle eating Turnips was nothing like the value of the manure furnished by cattle eating linseed-cake. Feeding cows for the dairy was a subject worthy great attention. In the first place, it seemed necessary to supply cows with food containing potassa. Potassa converted albumen into casein, that is, it made it soluble, and soluble albumen is casein, and casein is the most important constituent of milk. It might be a question as to whether casein was introduced directly into the blood from the food, or whether it might not be the result of the destruction of the already-formed tissues. Animals fed in the open air gave milk with more casein than animals fed in close places. The lecturer found more casein in the milk given in the evening after the cows were out all day, than in milk given in the morning after the cows had been standing all night. The tissues are consumed by exercise, and thus yield the casein. Parturition makes a great demand on the powers of the system, and Braconnot found that the milk of a cow directly after calving contained 15 per cent. of casein, a much larger proportion than ordinary. The alkalis, set free by motion, convert the albumen into casein. The butter in milk is not introduced, as Dumas asserts, with the food. It is formed from the starch that exists in the food. The only change necessary to convert starch into fat is the abstraction of oxygen. The sugar of milk is a peculiar compound; it consists of starch, with two proportions of water. The state of the mind affects the secretion of milk. In women, anger, sorrow, and anxiety, affect their milk so much, that children suffer very much, or even die, from the effects of partaking of it. For the same reasons, cows should be kept free from all kinds of irritation. When at a distance, they should be allowed to walk to the milking-place at their own pace, and never be driven. Exercise is bad for the butter. Where much exercise is allowed, the produce of butter is small: this arises from the oxygen consuming the carbonaceous material that would otherwise be secreted in the milk in the form of butter. In summer, flies torment cows in the day, and they do not yield so much butter. This may be remedied by sending the cows into the field at night, and keeping them at home in the day: but this must only be done in summer, as it would be a bad system during cold nights. Stall-fed cows produce most butter; and where butter is the object, cows should be turned into the richest pastures. With regard to the pastures for producing casein, or cheese, there is a very general impression that poor land is best adapted for producing cheese. In general in cheese districts the pastures are poor. It is, perhaps, the exercise which the animals take on poor lands, in order to obtain food, that (for reasons before stated) developes the casein in the milk. Stall-fed cows yield much less casein than those fed in pastures. Cows that are required to yield cheese should not be kept poor, but it is desirable that they should have to travel some way for their food. Some foods that animals eat flavour their milk, as Swedish Turnips: Buttercups colour it. Many plants may affect cows when taken with their food. The lecturer, a short time since, was in company with Dr. Daubeny and Dr. Buckland, in Somersetshire, where they met with a farmer, who stated, as a singular fact, that he had two pastures, the one of which, when he turned his cows in, they became purged; and the other, when he turned them in, produced constipation. The farmer could not account for this; but Dr. Daubeny, on examining the fields, found that the one which purged the cows contained a large quantity of Purging Flax (Linum catharticum) with the Grass, whilst the other contained an equal abundance of the common Tormentil, or Septfoil (Potentilla Tormentilla), a very astringent plant, which at once accounted for their peculiar action. In Scotland, they procure good milk from stall-fed cows, by feeding them upon malt refuse and bean and pea meal, and giving them beer to drink. The malt refuse supplies the materials for butter and sugar, the beans and peas the casein, whilst the beer keeps up the animal heat. Water would carry off the heat, besides acting injuriously by dissolving the blood globules.

The principles of chemistry will also enable us to assign the causes, and in some measure to prevent the occurrence, of diseases among cattle. What is called consumption rot, foot-rot, &c. in cattle, arises from a slow combustion, or destruction of their tissues, by the agency of oxygen. The same process goes on in vegetables; and it is well known that this process can be communicated from one vegetable to another, as from an Apple to an Orange, &c., and decaying vegetable matter will communicate this process to an animal. These diseases always occur amongst animals closely kept where there is much decaying vegetable matter about. Animals exposed to draughts do not take these diseases; the draught carries off the decaying ferment. When this process is established in the intestines, it produces diarrhœa, and this probably arises from animals consuming bad food. Red water and black water arise from the same disease extending to the kidneys. Rot in the feet comes on from the same cause. It always occurs at that season of the year when vegetable decomposition is greatest, and occurs to the greatest extent where animals are obliged to tread on decaying vegetable matter. The treatment of these diseases should be by antiputrescent materials, such as chlorine and the empyreumatic oils, &c. These will disinfect the stalls or sheds where animals are kept.

Dr. Playfair then stated that he had a few observations to make on the character of the internal and external structure of the organs of animals, in order to arrive at a knowledge of them as indications of their capacity for fattening and reaching an early maturity. These observations he wished to be put to the test of experiment, as he was aware that some of them were opposed to generally-received views. First, with regard to internal structure, which was the most important. It was generally considered that animals with large chests fattened best, and it was supposed that all animals with broad, round chests had large lungs. But this is not the case. Sheep have round chests and small lungs. Horses have narrow chests and large lungs. Southdown sheep have narrower chests than Leicester sheep, yet they have the largest lungs. The Leicester sheep are known to fatten soonest. He spoke here of the aboriginal breeds of these animals. He had asked butchers, and they were unanimously of opinion that the fattest cattle had small lungs and small livers. Now, this was a necessary consequence of the preceding principles. Where most oxygen was taken into the system, there would there be the greatest destruction of carbon, and consequently less carbonaceous material deposited in the form of fat. If two pigs had the same quantity of food, and one had lungs of double the capacity of the other, that pig would only appropriate half as much of its feed in the form of fat. Milk with much butter in it was known to be produced by cows with small lungs. The same held good with regard to the liver: where there was a large liver, there would be a large secretion of bile, and a large destruction of carbonaceous matter. If two animals ate 60lbs. of food, and one secreted 37lbs. of bile, and the other only 30lbs., the food that was not formed into bile would be converted into fat: hence the gain on the animal with a small liver. With regard to external signs, small bones indicated a delicacy of constitution, smallness of lungs and liver, and a tendency to fatten rapidly; whilst large bones indicated just the contrary. The "mellow" feel of an animal depended on the resiliency of the cellular tissue of the animal, the tissue in which the fat is deposited. When there is much mellowness, it arises from the blood being easily pressed from one part of the cellular tissue to another, and indicates a susceptibility to fattening. The reason why animals get more rapidly fat at the end of their feeding-season is, that the fat accumulating in the abdomen, presses upon the diaphragm and abdominal muscles, and thus prevents the more complete action of the lungs, and consequently the destruction of the carbonaceous material by the inhalation of oxygen. The fat also prevents the oxygen being absorbed by the skin, and diminishes by its pressure the capacity also of the liver, and thus also adds to the fattening process. Large ears indicate a general coarseness of bone and muscle, and the same condition of lungs and liver, and are thus indicative of a small capacity for fattening. There were other indications which might be referred to, but the lecturer hoped these hints would be sufficient to set inquiry afloat on a very important subject. He apologised for what he considered the incomplete evidence he had brought forward to establish some of his views, but stated he had experiments in progress which he hoped would throw more light on many of the more obscure points to which he had alluded.—Lord Spencer proposed a vote of thanks to Dr. Playfair for his lectures, and stated how much gratified he had been in listening to them. He hoped agriculturists would see from these lectures the great benefit likely to accrue to them from a knowledge of the principles of the science of physiology and chemistry. Mr. Pusey seconded the motion. Dr. Playfair, in returning thanks, stated that he had drawn up a series of statistical tables for circulation amongst butchers, for the purpose of gaining information on the internal structure of the animals which they slaughtered.

In our report of Dr. Playfair's lecture last week, the table of the analysis of albumen, gluten, &c., contains an error in the figures: we subjoin here a correct table.

	Gluten. Boussingault.	Casein. Scherer.	Albumen. Jones.	Ox-blood. Playfair.	Ox-flesh. Playfair
Carbon .	54·2	54·	55·	54·19	54·12
Hydrogen	7·5	7·1	7·	7·5	7·89
Nitrogen .	14·	15·6	15·9	15·72	15·72
Oxygen .	24·4	23·2	22·1	22·59	22·3

Dec. 10—From a report of the Council it appeared that the Society consists of nearly 6,500 members, and has excited throughout the kingdom a lively interest in the prosecution of Agricultural improvement; that the Council have received a favourable report of the sites for the show-yard and other buildings at Derby; and they have announced, that the principal day of the show is the 13th of July, and that all certificates must be lodged with the Secretary by the 1st June preceding. They beg to call attention to this rule, having decided that no certificate shall be received after that date. Since the last report, a resolution has been passed, affecting the order of their meetings, and defining the character of the business to be transacted at them: limiting to the first Wednesday in every month, at which any governors can be present, the deliberations on the official details of the Society's business, and throwing open to the meetings on the other Wednesdays, the presentation and discussion of communications on subjects of Agricultural interest, all members being allowed to attend the last-mentioned meetings. The Council have resolved not to give the prize to any samples of Seed-wheat selected at the Liverpool meeting and tried during the past season. The following is the adjudication of prizes for essays and reports of experiments in the present year:—To Barugh Almack, 20 sovs., for the best report of experiments on drill husbandry of Turnips. To And. Leighton, 20 sovs., for the best account of the natural history, &c. of the wire-worm, and the best means of protection against its ravages. To the Rev. W. L. Rham, M.A., 20 sovs., for the best essay on the mechanical properties of the plough. To J. Barton, 20 sovs., for the best account of the rotations of crops suited for light lands. To Dr. G. Fownes, 20 sovs., for the best essay on the food of plants. It was further reported, that no essays were sent in for the 15 sovs. offered for the best account of the varieties of Wheat suited to different soils, nor any essay of sufficient merit on making cheese. The Council has received from the judges appointed to consider the merits of the essays competing for the gold medal offered for the best record of the prognostics of changes in the weather, their report on the relative merits of these essays, and they have placed copies of those selected in the hands of Mr. Morton, jun., of the Whitfield Example Farm, for the purpose of a twelvemonth's accurate trial of the practical value and general correctness of the rules laid down by the respective writers. The judges of the essays for the prize of 20 sovs. for the best account of the rotations of crops suited for heavy lands, not having agreed on the essay most worthy of the prize, the Council have appointed an umpire on the occasion. The names of the Hon. H. Everett, the American Minister; of Dr. Playfair, the translator of "Liebig's Organic Chemistry applied to Agriculture;" and of Mr. E. Solly, jun., Experimental Chemist to the Horticultural Society of London, have been placed on the list of honorary members.

MISCELLANEOUS.

Manures.—At a meeting of the Chemical Society, Dec. 6, a communication from W. M. F. Chatterley, Esq., was read respecting some experiments with saline manures containing nitrogen, conducted on the Manor Farm, Havering-atte-Bower, Essex. The experiments were suggested by the prevailing opinion, that the fertilising power of some animal manures, and of the salts nitre (nitrate of potash), nitrate of soda, and sulphate of ammonia, depend upon the proportion of nitrogen they contain. The salts mentioned are all, from their low price within the reach of the farmer; and the quantity of the last thrown into the market is greatly increasing from the extension of the new mode of purifying coal gas from its ammonia, by washing the gas with dilute sulphuric acid. The interest also of experiments with salts is greater than with mixed manures, both to the farmer, who, from the nature of the former substances, may depend upon their uniformity, and to the chemist, as their composition is necessarily known to him. A field of Wheat was chosen, which in the latter end of April, 1842, presented a thin plant; the salts were top-dressed over the land, by hand, on the 12th of May, and the crop mowed on the 10th of August. The soil was rather poor, consisting of a heavy clay upon a sub-soil of the London clay. 1. No manure: Corn per acre, 1413 lbs. 2. With 28 lbs. of sulphate of ammonia: Corn, 1612 lbs. 3. With 140 lbs. of the same salt: Corn, 1999 lbs. 4. With 112 lbs. of nitrate of soda: Corn, 1905 lbs. 5. With 112 lbs. of nitre: Corn, 1890 lbs. The increase in the straw was also considerable in all cases, except with the small proportion of sulphate of ammonia. The total increase in the four manured crops was, per cent., in the order in which they were enumerated, 14·1, 41·5, 34, and 33·5; the cost of the manure for the three last did not greatly differ, being 21*s.* 9*d.*, 21*s.* 6*d.*, 27*s.* 6*d.* The profit on the outlay was—with the small dose of sulphate of ammonia, 294 per cent.: with the large dose, 212 per cent.; with the nitrate of soda, 138 per cent.; and with the nitrate of potash, 92 per cent. The principal conclusions drawn by the author are, that the increase of the nitrogen in the crop is greater than is accounted for by the nitrogen of the manures, showing that these manures have a stimulating effect, or enable the plants to draw additional nitrogenised food from the soil and atmosphere; the considerable superiority of sulphate of ammonia over the other salts, and the greater proportional efficiency of a small than of a large dose of that salt. The sulphate of ammonia costs 17*s.* per cwt. It appears best to apply this salt in the proportion of about 1 cwt. per acre, at three different dressings—the first quantity when the crop, if Wheat, makes its spring growth, or if of Oats, when about two inches above the ground; the second quantity about a month afterwards; and the third quantity at the time of the formation of the ear. To meet the practical difficulty of distributing so small a quantity as one-third of a cwt. over an acre, about twice the quantity of common salt or of soot may be mixed with the ammoniacal salt. These, and most saline manures, when used as a top-dressing, should be supplied to the plant, when dry, some time after a shower of rain, or during hazy weather.

Value of Kyan's Patent in preserving Bamboo and other Garden Fences.—Some specimens of Kyanised Bamboo, which had been submitted to the above process upwards of three years previously, were exhibited by J. Drummond, Esq., at a meeting of the Agri-Horticultural Society of India. Since their being first Kyanised, they had been exposed to the influence of three seasons as a garden-fence, during which period another portion of the fence, which was made of Bamboo not so prepared, had been several times renewed, being found completely decayed and destroyed by the white ants. The proportion of oxymuriate of mercury used was about 1 lb. to 15 gallons of water, and the wood was steeped in the solution for ten or twelve days. Another advantage derivable from the use of this solution is, that, by slightly sponging the mattings of rooms in situations likely to be infested by white ants, they will be effectually preserved from the ravages of these destructive insects.—*Transactions of the Agri-Horticultural Society of India.*

To boil Cabbages.—In boiling Cabbages or common Greens, it is necessary that a large quantity of water be used, into which a little salt and a small piece of soda should be thrown, in order to preserve their agreeable green colour.

THE NATURALIST'S CORNER.—No. VI.

(*Continued from page 791.*)

20. The sedative powers of the *Lactuca sativa*, or Lettuce, were known in the earliest times; allusions to this plant frequently occur in the medical writers of antiquity. We are told that Galen, in the decline of life, suffered much from morbid vigilance, until he had recourse to eating a Lettuce every evening, which cured him.

21. The leaves of the *Kalmia latifolia* are feasted upon by the deer and the round-horned elk; but are mortally poisonous to sheep, to horned cattle, to horses, and to man. The bee extracts honey without injury from the flower of this plant; but the man who partakes of that honey, after it is deposited in the hive-cells, falls a victim to his repast. In the autumn and winter of 1790, at Philadelphia, extensive mortality was occasioned among those who had eaten of the honey collected in the neighbourhood of that city, or had feasted on the common American pheasant, or pinnated grouse, as we call it. The attention of the American government was excited by the general distress; a minute examination into the cause of the mortality ensued; and it was satisfactorily shown that the honey had been chiefly extracted from the flowers of the *Kalmia latifolia*, and that the pheasants which had proved thus poisonous had fed harmlessly on the leaves. The consequence was, that a public proclamation was issued, prohibiting the use of the pheasant as a food for that season.—*From Dr. Hancock's Essay on Instinct.*

22. The *Oxalis acetosella*, or common Wood Sorrel, has been supposed to be the true Shamrock of the Irish, instead of the Trefoil, to which the name is more commonly ap-

plied. In the tropical parts of India is an annual Oxalis, called *Oxalis sensitiva*, in consequence of its pinnated leaves being irritable like the sensitive plant. It has been lately ascertained that the European three-leaved species have the same property, only in a more feeble degree; this phænomenon is most conspicuous in a hot sunny day.

Reviews.

The Journal of the Royal Agricultural Society of England. Vol. III. Parts 2 and 3. Murray.

This is one of the best Numbers of the Society's Transactions which has yet appeared. It contains an admirable view of the progress of agricultural knowledge during the last four years, by Mr. Pusey; an interesting account of the meeting of German landowners in 1841, at Doberan, by Mr. Handley; the second part of Mr. Rham's valuable account of the agriculture of the Netherlands; further observations by Mr. Curtis upon insects injurious to the Turnip crop; a detailed and very important report on the implements exhibited at the meeting of the Society at Bristol; an account by Dr. Daubeny of the public institutions for the advancement of agriculture existing in other countries; and several other papers of interest.

The worst communication is one on the planting of forest-trees, which, we must say, is unworthy of being associated with the other papers it stands among; not that it does not contain some good matter and sensible remarks here and there, especially in the latter part; but upon the whole it is a poor affair. In all papers of this kind it is essential that no errors upon matters of known fact should be introduced. But the author of the paper in question says that the epidermis of bark is a thin transparent membrane *beneath the rough external coating*, while it is the most external layer of the bark, and the first to perish. Then he falls into the old error of supposing that Quercus pedunculata is the only species of Oak in this country of any value—a mistake that has been exposed over and over again; adding, too, that the Durmast is an *inferior species*, although the fact is that it forms the finest trees in the New Forest, and is the same species. On the other hand, he omits all notice of the sessile-fruited Oak, the most majestic and best of our two native species. The Larch, he tells us, is the Larix Pinus (!); and he advocates the necessity of pruning plantations regularly. "It is no argument," says the author, "against the careful and judicious thinning and pruning the trees in plantations and also of natural forests, that we get fine timber from the Continental forests that have had no such advantages. The trees in such forests are very differently circumstanced from those in plantations, as the latter are all planted at one time, and are equal rivals of each other; whereas, in the former case they rise at different times, whereby some obtain an ascendancy, *and are enabled to spread forth their branches and produce fine timber.*" Surely this, which is an important fact, while it shows the necessity of thinning, is one of the best of all arguments against the practice of pruning. Such trees have room to grow in, which is what they want, and they are not touched by the forest-pruner, which they do not want, and thus they produce noble timber. We should like to know how those magnificent specimens of Oak in Sir John Trevelyan's park, at Nettlecombe, of the sessile-fruited kind too, have been treated. The timber-pruner has had no hand in managing them, we suspect: they are the wild children of the forest.

The Farmers' Calendar of the Stationers' Company contains as much information useful to Agriculturists as can be crammed into 96 pages.

CALENDAR OF OPERATIONS *for the ensuing week.*

We have been applied to for a list of the best kinds of vegetables, which, if given in this place, might be useful to others as well as to the applicant. There are, no doubt, many other sorts equally good; but those named below we can recommend from personal knowledge. As the cultivation of an unnecessary number of sorts of any vegetable is useless and troublesome, a few names only are given; and those things of which there are no permanently distinct varieties, as the Brussels Sprout, or are universally well known, as the Borecole, Cauliflower, &c., have been purposely omitted.

Beans.—Marshal's Early Prolific—the earliest; Dwarf Fan—very dwarf, suitable for small gardens; Green Long-pod.

Broccoli.—Purple Cape; Grange's Early White; Miller's Dwarf White—very dwarf, comes into use all at one time; Knight's Protecting; Jackson's Late White—an excellent late sort; Late Purple.

Cabbages.—Atkins's Dwarf—one of the smallest, but large enough for a gentleman's table; Young's Matchless; Vanack; Braganza (*Coure Tronchuda*) or Portugal—not a true Cabbage—the midribs of the leaves are eaten like Seakale.

Carrots.—Early Scarlet Horn; Altringham—chosen for their dark colour.

Celery.—Violet—introduced by the Horticultural Society, solid and good; Seymour's Superb Red; Flat-stalked White—a local name, possibly the same as Seymour's Superb White.

Cucumbers.—Sion House—this and the succeeding are good sorts for winter forcing; Commander; Windsor Prize—an old sort, better than many of the vaunted new ones.

Kidney Beans.—Fulmer's Early—bears long pods in succession—other good sorts are well known: Small White Runner—differs from all those described at p. 236—the seeds make a good winter dish.

Lettuces—Victoria Cabbage; Asiatic Cabbage—an excellent sort; Brown-spotted Cabbage—a local name—a French Lettuce of first-rate merit; Green Paris Cos—this and the White Paris Cos are the best summer varieties; Black-seeded Brown Cos—said to be hardier than the common Brown or Bath Cos; Atkins's Imperial Cos—small but very good; Alphange Cos—a large and very sweet summer kind—requires tying; Verte d'hiver Cos—the hardiest of all the Cos Lettuces—requires tying to blanch it.

Onions.—Tripoli—grows to a large size when sown in autumn, but does not keep well; White Spanish; Globe; James's.

Peas.—Early May—a full week earlier than the Frame—grows from two to three feet high; Early Frame; Milford Marrow—a fine large Pea, but does not bear in succession; Green Imperial; Auvergne—a very prolific Pea; Knight's Dwarf Green Marrow—continues in bearing a long time—an excellent sort.

Spinach.—Flanders—much superior to the common sorts, but difficult to procure true.

Turnips.—Early Dutch—sow for the first and second crops only; Stone—the best garden Turnip, but runs if sown early; Malta—yellow.

Many of the above are well known; others are not so. Taken as a whole, however, it will be found a useful selection; and, excepting Kidney-beans, which might be increased by referring to p. 236, it is quite large enough for the supply of any establishment.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—The roots of the plants demand equal care with the tops; pay attention, therefore, to the directions previously given respecting the management of the beds. If the surface of the bark becomes dry, and the heat deficient in consequence, moisten the surface with warm water; but this must be cautiously done, lest the soil in the pots should get a greater quantity than would be desirable. If a syringe is used for this purpose, take care not to throw water into the hearts of the plants, especially of those which are intended to fruit in spring.

Vinery.—Increase the artificial temperature gradually to 60°, which might be allowed to rise a few degrees by the influence of sunshine, when air should be given. Continue to moisten the wood till the buds break, and occasionally turn over the fermenting dung in the house.

Peach-house.—Follow the directions given last week as to general management; the temperature, however, should be increased during the week to 50°, with a liberal admission of air by day.

Cucumbers.—The foliage of plants growing in pits can be kept sufficiently moist without syringing, by the usual means of placing open vessels of water on the heating apparatus; but in large houses, as Pine-stoves, where the atmosphere is likely to become drier, the leaves should be occasionally sprinkled.

Out-door Department.

At this season of the year the chief business in this department is to get the ground in good order against the coming spring, by trenching, manuring, and digging. It should now be determined, so far as it can be done, what crops are to occupy the principal quarters next season, that the ground might be treated accordingly. Any work of importance which has been omitted had better be hastened before wintry weather sets in, and especially all that relates to the preservation, during winter, of the various crops.

Orchard.—It seems to be necessary to explain that the practice recommended in our preliminary remarks at p. 775 was not meant to be confined to wall-trees alone, although these were especially mentioned, but applies equally to *quenouille* or any other form of training, when (if the expression is admissible) the principle of growth overpowers the principle of fructification in fruit-trees; and this state might be brought about at any time by accidental circumstances, such as a moist growing summer succeeding a cold frosty spring. The female flowers of Nut-trees being in an unusually forward state, pruning had better be deferred till spring, when it can be ascertained which blossoms have escaped injury.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Attend to the directions formerly given, and prevent the air of the house from becoming too dry from the heat of the flues. Do not syringe the common plants much, unless for some particular reason. Prevent the white bug or other little insects from infesting the plants; try the effect of Chamomile flowers upon the scale, as has been recommended by Sir Charles Monck.

Greenhouse and Conservatory.—Although plants in pots require but little water at this season of the year, they must not be neglected in this particular; sunny days succeeded by frosty nights, which make fires necessary, dry the soil very quickly. Give all the air possible on fine days. Use every available means to prevent the increase of insects in all plant-houses.

Pits and Frames.—Lose no opportunity that presents itself to dry the plants; pots of cuttings require much attention in this respect. Some of the most forward seedling Cinerárias and Calceolárias will perhaps require shifting now; afterwards they will need very little water. Ixias, Sparaxises, Lachenálias, &c. that are growing, must be kept in a light and airy situation.

Out-door Department.

The remarkable mildness of the season has caused the buds of some plants to burst into growth, as though it were spring. We have observed this to be more particularly the case with climbing shrubs, such as the Honeysuckle and Clématis Viticella; consequently the pruning of these and others that are equally excitable had better be deferred till all danger from frost is past. If the shoots were to be shortened now, a continuance of warm weather would cause the buds near the base, which at present are dormant, to vegetate. All ground-work should be expedited in this favourable weather.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Procure, and plant in rows, a number of wild Rose stocks, for budding with choice varieties. These are generally difficult to obtain with good roots; but if removed before winter, they are more likely to grow than when planted in spring.

Forest and Coppice Woods.—See the last few weeks.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Dec. 15, 1842, as observed at the Horticultural Garden, Chiswick.

Dec.	Barometer.		Thermometer.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
Friday 9	30.397	30.282	43	36	39.5	S.E.	
Saturday 10	30.265	30.165	39	38	38.5	S.	
Sunday 11	30.017	29.851	43	38	40.5	S.E.	.32

Average	30.119	30.037	50.7	39.7	45.2		.33

Dec. 9. Foggy throughout.

10. Densely and uniformly overcast; temperature of day and night nearly the same.

11. Foggy; slightly overcast; clear and fine; rain at night.

12. Rain: overcast and mild.

13. Exceedingly fine, with bright sun; higher temperature than has occurred in December for the last 16 years at least; a splendid halo round the moon in the evening, exhibiting strongly-coloured rings, the colours corresponding with those of the rainbow.

14. Overcast; exceedingly fine, with bright sun; clear at night.

15. Very fine throughout.

Mean temperature of the week 5½° above the average.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending Dec. 24, 1842.

The highest temperature during the above period occurred on the 24th, in 1827—thermometer 57°; and the lowest on the 24th, in 1830—thermometer 10°.

REPORT ON COVENT GARDEN MARKET,

For the Week ending Dec. 16, 1842.

[The Half-sieve contains . . .	3½ imperial gallons.
The Sieve	7 " "
The Bushel Sieve	10½ " "
The Bushel Basket	1 imperial bushel.
Punnets for Seakale are . . .	7¾ in. wide and 2 in. deep.
" Radishes	8 " 2 "
" Mushrooms	7 " 2 "
" Salad	5 " 2 "]

The supply of Fruit has been smaller than for many preceding weeks; the demand has not increased, and prices remain nearly the same; an advance may, however, shortly be expected. *Fruit:* Pines are not very numerous; Hothouse Grapes are becoming less plentiful, and have advanced to 4*s*. per lb.; excellent samples of Lisbon Grapes are offered from 9*d*. to 1*s*. per lb. Dessert Pears remain the same as quoted in our last Report, with the addition of the Passe Colmar, at 5*s*. per half-sieve: baking Pears are well supplied from 2*s*. to 2*s*. 6*d*. per ½-sieve. Amongst the Dessert Apples are the Newtown Pippin, at 2*s*. per dozen; Nonpareil, at 4*s*. per half-sieve; the Golden Harvey and Golden Pippin, from 3*s*. to 4*s*. per half-sieve, with some handsome samples of the Reinette grise, or French Reinette, grown in this country. Good Medlars are becoming scarce, and fetch as much as 9*d*. per dozen. A few Cucumbers may be obtained from 1*s*. to 1*s*. 6*d*. each. *Vegetables:* Asparagus, although deficient in size, is tolerably well supplied; the demand for it at present is not great. The quality of the Seakale offered is much superior; the prices of both do not differ from those of last week. A few bundles of Rhubarb are still offered, from 1*s*. 6*d*. to 2*s*. each. Some very fine Cardoons have also appeared, from 1*s*. 6*d*. to 2*s*. each. Mushrooms are plentiful, and may be obtained from 6*d*. to 1*s*. per pottle. Truffles are also abundant, from 2*s*. to 2*s*. 6*d*. per lb. With regard to other Vegetables, there has scarcely been any alteration for several weeks. *Flowers:* The cut flowers consist of Euphórbia jacquiniflora, Poinséttia pulchérrima, Cýclamen pérsicum, the Christmas Rose, Lilacs, Chinese Primroses, Azáleas, Narcissuses, Tulips, &c.

PRICES, Saturday, Dec. 17, 1842.—FRUITS:—

Pine Apple, per lb. 3*s* to 5*s*
Grapes, Hothouse, per lb. 4*s*
— Spanish, 9*d* to 1*s*
— Portugal, 1*s* to 1*s* 6*d*
Cucumbers, per brace, 2*s* to 3*s*
Apples, dessert, per bush., 2*s* 6*d* to 7*s*
— Kitchen, 2*s* to 5*s*
Pears, dessert, per hf. sieve, 2*s* to 6*s*
Pomegranates, per doz., 3*s*
Medlars, per doz. 9*d*
Oranges, per doz., 9*d* to 2*s*
— per 100, 5*s* to 16*s*
— bitter, per 100, 12*s*

Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Almonds, per peck, 6*s* to 7*s*
Sweet Almonds, per pound, 3*s*
Chesnuts, per peck, 3*s* to 7*s*
Walnuts, per bush., 12*s* to 16*s*
Filberts, English, per 100 lbs. 60*s* to 7 *s*
Cob Nuts, per 100lbs., 75*s* to 80*s*
Nuts, per bushel—
— Brazil, 16*s* to 20*s*
— Spanish, 20*s*
— Barcelona, 24*s*

VEGETABLES.

Savoys, per doz. 6*d* to 1*s*
Cabbage, per doz. 9*d* to 1*s*
— plants, per doz. 1*s* 6*d* to 2*s* 6*d*
— Red, for pickling, 1*s* 6*d* to 5*s*
Brussels Sprouts, per hf.-sv. 1*s* 3*d* to 2*s*
Broccoli, White, per bunch, 10*d* to 1*s* 6*d*
— Purple, 8*d* to 1*s*
Cauliflowers, per doz., 1*s* to 4*s*
Potatoes, per ton, 40*s* to 75*s*
— per cwt. 2*s* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bu., 1*s* 6*d* to 2*s* 6*d*
— Scotch, per bu., 1*s* 6*d* to 2*s*
— New Autumn, per lb., 6*d* to 9*d*
Jerusalem Artichokes, per half-sieve, 9*d* to 1*s* 6*d*
Turnips, per doz. bun., 1*s* to 2*s* 6*d*
Red Beet, per dozen, 9*d* to 1*s*
Scorzonera, per bundle, 1*s* 3*d* to 1*s* 6*d*
Salsafy, per bundle, 1*s* 3*d* to 1*s* 6*d*
Cardoons, each, 1*s* 6*d* to 2*s*
Horse Radish, per bundle, 1*s* 6*d* to 4*s* 6*d*
Radish, per doz. hands (24 to 30 each) 9*d* to 1*s*
— Turnip, p. doz. bch., 1*s* to 2*s* 6*d*
Carrots, per doz. bun., 3*s* to 5*s*

Parsneps, per dozen, 9*d* to 1*s*
Spinach, per sieve, 1*s* to 1*s* 6*d*
Leeks, per doz. bun., 1*s* 6*d* to 2*s*
Onions, per bushel, 4*s* to 6*s*
— Pickling, per hf.-sv., 3*s* to 4*s*
— Green, p. doz. bun. 3*s* to 4*s*
— Spanish, per doz. 2*s* to 4*s*
Garlic, per lb. 6*d* to 8*d*
Shallots, per lb., 1*s*
Asparagus, per 100, 8*s* to 10*s*
— Second or Middling, 3*s* to 5*s*
Sea-kale, per punnet, 1*s* 6*d* to 2*s* 6*d*
Lettuce, Cabbage, p. sc., 6*d* to 9*d*
— Cos, 9*d* to 1*s*
Endive, per score, 9*d* to 1*s* 6*d*
Celery, p. bd., (12 to 15) 6*d* to 1*s* 6*d*
Rhubarb Stalks, per bundle, 1*s* 6*d* to 2*s*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Tarragon, per doz. bun., 2*s* to 3*s*
Sage, per doz. bunches, 1*s* 6*d* to 2*s*
Mint, per doz. bunches, 2*s*
Chilies, ripe, per 100, 1*s* 6*d* to 2*s*
Mushrooms, per pottle, 6*d* to 1*s*
Truffles, per lb., 2*s* to 2*s* 6*d*

Notices to Correspondents.

Manures.—*J. T.*—If you have the opportunity of procuring a quantity of ground Logwood, after having its colouring matter boiled out of it, you may use it advantageously as a manure by mixing it with cloacine (see p. 824), or any putrefying animal substances. As they rot, it will rot; and it will at the same time soak up the fluid matter, which should not be lost. Or if you wet it well with gas-water, and throw it in a heap, it will probably be thrown into violent fermentation, and so will rot. It cannot be employed as a manure in its undecayed state.†

Guano.—*A Subscriber* will find where this manure can be procured by referring to our advertising columns. Caméllias, Fúchsias, and plants of that description should only be watered with liquid guano when they are growing freely.‡

Liquid Guano.—*Querist.*—This is prepared by mixing about 4lbs. of guano with 12 gallons of water; this should stand about 24 hours before being used, and when drawn off, 24 gallons more of water may be put to the same guano.‡

Ventilation.—*An Amateur.*—As far as we can understand your situation, there is no means of obtaining the necessary ventilation except by opening the ends of your house. If that, however, can be well done, there will be air enough in so small a house, and no inconvenience need result from it. But is it really impossible to move the sashes of the roof? If they will not slide, can they not be hinged, so as to open when pushed from the inside? If that were possible, your difficulty would be at an end†

Heating.—*G. S.*—The reason why we recommend iron pipes, in preference to brick flues, for the circulation of hot water in your Vinery, is on account of the greater command which, by the former method, you will have in maintaining any required degree of moisture in the atmosphere. You cannot do better than procure one of Rogers's Conical Boilers.‡

Coverings for Pits.—*A. Z.*—Common calico, steeped in hot bee's-wax and linseed oil, becomes impervious to wet. You might protect your frames by covering them first with hay or dry fern, and then the above material over the whole, taking care that it is properly secured against high winds.‡

Vines.—*A Gardener* writes thus respecting his Vine-border: "The border was made and the Vines were planted about 12 years ago; the Vinery being divided into two compartments for early and later forcing. When I entered upon the situation (which was only in June last), I found the Vines on the two houses showing a considerable quantity of bunches with small berries, of which I immediately took away about one-half. I also found on the border, and extending close up to the wall of the Vinery, a very strong crop of Broccoli, Borecole, and similar Vegetables; whilst, on the left-hand side of the border, and within about six yards from the Vinery, was a strong Hawthorn, Quick, and Holly hedge; at the right-hand side, a strong Laurel and Privet hedge; and at the extremity of the border, a large Weeping Ash. I immediately removed the Broccoli, &c., and took up the Ash-tree, as well as the Quick and Holly fence. The fruit in the earlier-forced house did not ripen fit for use; the fruit in the others, which I thought it best not to force at all, ripened tolerably well. I have within the last few days dug a trench of about 3 ft. in depth, at the extremity of the border, and about 18 feet from the wall of the Vinery. At that depth I find a sandy rock; and there, as well as at other points where I have made a partial examination, that the roots of the Ash, Quick, Holly, Privet, and Laurel have extended over the whole of the bed, and have totally destroyed the roots of the Vines." [In this case we should certainly recommend him to take up the Vines in the manner recommended at p. 117 of last year, and to form an entirely new border. Should he be unable to do this, he may give them the chance of another season, and endeavour to keep their roots near the surface by the application of bone-dust, or some other rich manure. If the roots of Ash, Privet, &c. decay, his Vines may possibly succeed; but the surest method will be to make a new border at once.] ‡——*A Subscriber.*—The composition which you have been in the habit of applying to your Vines after pruning, viz. ¾ lb. of soft soap, 1 lb. of sulphur, and ½ of an ounce of black pepper, to 4 gallons of water, boiled together for 20 minutes, is as good as any other, provided you make it thick enough to adhere to the wood like paint. If it does not, you might thicken it with lime, adding sufficient soot to take off the glaring white colour of the lime. The proportions are of little consequence, the object of this and similar washes being, by adhering to the wood, to prevent the eggs or larvæ of insects from coming to life. *W.*——*Simpleton.*—The rod and spur systems of pruning Vines have both their advocates, and good Grapes may be produced in either way with proper treatment. We prefer, however, the spur system.‡

Forcing Peaches.—*D. T.*—In our opinion, the best paper upon this subject is that published by Mr. Errington, in the Transactions of the Horticultural Society, of which an extract appeared at p. 7 of the *Chronicle* of last year. You cannot do better than follow his directions.‡

Hollies.—*Ilex.*—You need be under no apprehension that the suckers which have sprung from the base of your Holly-tree will be injured by the removal of the decayed stem; they will, on the contrary, be greatly benefited by it. ‡

Annuals.—*A Subscriber.*—Calliopsis Drummondi is of a bright yellow colour, with a dark centre, and attains to the height of 2 feet. Hibiscus africanus is of a delicate primrose colour, with a deep purple centre, and grows from one foot to a foot and a half high. ‡

Violets.—Δ.—Your Violets are evidently unhealthy and not able to perfect their flowers; but without knowing something of your treatment, it would be difficult to say what is the cause. It is probable that you may keep them too damp and cold, or perhaps they are old plants. We advise you to look in our back Numbers for articles on their management, and then you will probably see where you have erred. §

Pentstemons.—*M. N.*—The most showy species of Pentstemon are—

P. speciosus, bright blue
crassifólius, deep lilac
ovatus, bright blue
Murrayanus, bright scarlet
diffusus, deep blue
Scoúleri, lilac
venustus, light purple
gentianoides, brownish purp.
gent. coccíneus, scarlet
Mackayanus, purp. & white

P. latifólius, white, slightly stained with purple
argutus, purple
procerus, bright blue
glandulosus, deep blue
pulchellus, light blue
campanulatus, rosy red
atropurpúreus, brownish purple
Cobæa, purplish white. ¶

Dog-Roses.—*Simpleton.*—This is the proper time to procure standard Dog-Roses for budding upon in summer. ‡

Cinera'rias.—*J. L. S.*—Cinerárias always present the appearance you describe, when they are unhealthy or when they are attacked by insects. The green fly for example, which is very fond of them, will attack the under side of the leaves, and make them curl. The only remedy we can suggest is, to pot the plants regularly, supply them moderately with water, and smoke them whenever the green fly makes its appearance. §

Chrysanthemums.—*Brightoniensis and M. B.*—Good dark Chrysanthemums are at present rare. The best which we have yet seen are Campestroni, purple; Duc de Canegliano, dark red; Phidias, a pretty compact flower, red at first, and afterwards changing to purple; Julius Cæsar, reddish brown; Theresa, orange and red; and Maria, red. A scarlet variety has not yet been raised. The above sorts may, no doubt, be procured of any respectable nurseryman. ‡

Leschenau'ltia.—*Brightoniensis* will find it more advantageous to procure young plants of this from a Nursery than to undertake to strike cuttings of it herself, as they are very difficult to manage. They require to be cut clean across at a joint, and to have the lower leaves clipped off close to the stem. They should then be planted in pure silver-sand, in a well-drained pot, covered with a bell-glass, and treated in every respect like Heath-cuttings. ‡

Russe'lia ju'ncea.—*A Young Gardener.*—This plant requires to be potted in rich soil, with plenty of pot-room, and when growing to be freely supplied with water. No doubt the cause of your plant's ill health is occasioned by inattention to these material points. ‡

The Rock Lily.—*Wills.*—This is a well-known plant, the Lycopódium involvens or squamatum, alluded to at p. 363 of this year's *Chronicle.*†

Plants for a Conservatory.—*Phœbe.*—The following plants are well adapted for the border of a Conservatory:—Acácia vestita, A. hýbrida, A. armata, A. pubescens, Chorozema varium, Lucúlia gratíssima, Hóvea Celsi, Sóllya heterophylla, Goódia lotifólia, G. pubescens, Eutaxia myrtifolia, Pimelea híspida, P. decussata, Fuchsia splendens, Coleonema tenuifólia, Burchéllia capensis, Genista canariensis, Indian Azaleas, and Caméllias. The climbers may consist of Hardenbérgia macrophylla, Mandevilla suaveolens, Tacsónia pinnatistípula, Kennédya Marryattæ, Zichya glabrata, and Ipomœa Leárii. ‡

Orchidaceous Epiphytes.—Two gentlemen have a dispute upon these points,—"Are Epiphytal Orchidaceæ, strictly speaking, parasitical plants, or not?" Certainly not; they derive no food from the plants to which they are attached, growing *on* them, not *in* them. "Do they, or do they not, derive nourishment from the branches of trees or other substances *on* which they grow?" They feed on the dead matter that may lodge on the branches that bear them, but not on the living matter of the branch. "A. asserts they are not parasitical, as they do not derive nourishment from that on which they grow, in their natural habitats—growing equally well on a live tree or a dead tree; and instances the genus Brasavola, of which Dr. Lindley says, it always grows on rocks and stones, never on trees." A. is right. "B. asserts the reverse, and instances the Tree Ferns and Palms in the West Indies, both soft and rough, and which are the favourite supports of such plants; and adds, it is well known that they thrive better in some moulds than in others in Britain, though both are equally well drained, and that they derive considerable nourishment from the substances in which they grow." No doubt the decaying matter on Tree Ferns will enable Epiphytes to grow, but so does the dead matter on a brick wall. "A. admits they thrive better in some moulds than others, but asserts it is immaterial in what substance they grow, so long as they do not dislike that substance; that it is merely a matter for the roots to attach themselves to, and not as a matter of nourishment." A. is right.

Fuchsias.—*A Young Beginner.*—The following Fúchsias may be recommended:—F. splendens, fulgens, Lánei, róseo-alba, St. Clare, Moneypénnii, Riccartónia, Chandleri, formosa élegans, stylosa conspícua, péndula terminalis, and exímia.‡

Polyanthuses.—*Mitcham.*—For lists of first-rate Pansies we refer you to p. 793 of the *Chronicle*, of the present year. The following are first-rate varieties of the Polyanthus:—

Clegg's Lord Crewe,
Cox's Prince Regent,
Buck's George the Fourth,
Fletcher's Defiance,
Pearson's Alexander,
Collier's Princess Royal,
Lord John Russell,
Clegg's Prince of Orange,
Eckersley's Jolly Dragoon,
,, Black and Gold,
Hufton's Lord Rancliffe,

Hufton's Squire Ray,
,, Earl Grey,
Stead's Telegraph,
Crownshaw's Invincible,
Nicholson's Gold Lace,
,, King,
,, Bang Europe,
Turner's Emperor,
Wilson's Bucephalus,
Barnard's Formosa,
Maude's Beauty of England.*

Pelargoniums.—*W. J. B.*—We have examined your list, and recommend you to grow the following sorts:—

Colossus,
Vandyke,
Fosteri Multiflora,
Lord Auckland,
Smilax,

Vivid,
Niobe,
Mary of Burgundy,
Dennis' Pefection,
Bridegroom,

Simile,
Decorum,
Kate Nickleby,
Lady Bulteel,
Lady Bridport.*

Roses.—*A Subscriber*, who has lately planted a standard Rose, and, in order to give it a good dressing, has filled the hole with rotten dung, to which four decent-sized rats and a shovelful of bone-dust have been added, will find that such an abundance of manure will make his plant grow too luxuriantly and will probably cause them to canker. Roses do not require such a highly-manured soil; it will cause them to produce shoots of such rank growth, that they will not ripen properly, ahd an inferior bloom will be the consequence.‡——*A Young Beginner.*—It is not very probable that you can procure at the nurseries such Roses as Brennus, Triomphe de Lahay, Comte de Paris, and White Noisette, &c., upon their own roots. Those sorts can be propagated quite as successfully by layering as by budding.‡——You will find excellent directions for pruning Roses at pp. 691 and 708 of this year's *Chronicle* ‡——*W. J. B.*—We cannot undertake to name the Roses that will prove best suited for exhibition in pots. You must consult the great growers upon this point. No doubt, however, those with the habits of Spong's, De Meaux, and the like, will answer well.‡

Guernsey Lily.—*Simpleton.*—You must give your offsets of this plant every encouragement during their growth, by allowthem plenty of air, light, and water, in order that they may make strong, healthy foliage, which should be carefully preserved from injury. When the leaves begin to turn yellow, water should be gradually discontinued, and the bulbs may remain in the earth until they begin to show signs of growing; they may then be repotted in rich sandy soil. Under this treatment the bulbs will soon acquire sufficient strength to flower.‡

Melons.—*I. G. H.*—The Beechwood Melon, which we recommended as the best known variety, was originally grown by Sir John Sebright, and sent out by the Horticultural Society. The Fellows of the Society can obtain its seeds; but we do not know whether it is on sale to be depended on.†

Late Pears.—*Globosa.*—The Easter Beurré, Ne plus Meuris, and Beurré Rance, are good Pears for spring use. ‖

Potatoes.—*M. N.*—To plant an acre of Potatoes in rows 3 feet apart, you will require 12 cwt. 8 lbs., or about 24 bushels, allowing the sets to be 6 inches from centre to centre in the rows, and each set to weigh an ounce. This is a good size for sets; and if you take tubers that will admit of being cut into not fewer than 8 of such sized pieces, you will have a better return than you would by using small Potatoes, either whole or little divided; for although in small tubers you may allow the same weight to each set, yet the eyes, being furnished with weaker buds, produce less vigorous shoots than result from Potatoes of a larger size. The Bread-fruit Potato is both good and prolific. ‖

Vegetables.—*J. E. H.*—The following is a list of good varieties:—*Peas:* Early Charlton, D'Auvergne, Blue Prussian, Knight's Dwarf Marrow, Knight's Tall Marrow, Groom's Superb Dwarf, Milford Marrow. *Beans:* Marshall's Early Dwarf Prolific, Long Pod, Broad Windsor. *Onions:* Strasburg, Brown Portugal, James's Keeping, Madeira, and the Nocera (for pickling). *Leek:* London Flag. *Cabbages:* Early York, Battersea, Pomeranian, and Vanack. *Broccoli:* Grange's Early Cauliflower, Knight's Protecting, Portsmouth, Chappel's Cream-coloured. *Savoys:* Large Green, Yellow. *Turnips:* Early White Dutch, Maltese. *Carrots:* Early Horn, Long Orange, Altringham. *Parsnep:* Hollow-crowned. *Potatoes:* Ash-leaved Kidney, Early Manly, Chapman's, Kentish Seedling Goldfinder, Leathercoat, Champion, Red-nosed Kidney, Bread fruit. *Celery:* Violet, or Manchester Red, Flat-stemmed White, Seymour's Superb White. *Lettuces:* Malta, Hardy Hammersmith, White Paris Cos, Green Paris Cos, Brown Cos. *Spinach:* Flanders, Lettuce-leaved, Round. *Beet:* Castelnaudary, Whyte's Dark Red. *Radishes:* Scarlet, Short-topped Scarlet, Early White Turnip-rooted, Crimson Turnip-rooted. *Cucumbers:* Southgate, Allen's Victory of Suffolk, Mills's, Weedon's Black Spine, Man of Kent. ‖

Woodlice.—*A. W.*—The method adopted by Mr. Sellers for preserving his Mushrooms from woodlice is, to procure a few half-inch boards, about three inches broad, one edge having a groove to contain liquid, the other being wedge-shaped to insert into the soil. When the Mushrooms appear, the beds are surrounded with these boards, and the earth is pressed so tightly round them as to prevent the insects from getting beneath them. The grooved upper edge is then filled with tar, which effectually preserves the Mushrooms from the attacks of woodlice, which cannot pass over the pitchy barrier. The same means will also protect them from earwigs ‡

Scale on Fruit-trees.—*Globosa.*—Scrub your trees repeatedly with a brush and water in spring, when the young insects are migrating from below their scaly habitations. Tobacco-water also may then be applied occasionally. ‖

Books.—*J. S.*—There is no periodical which treats expressly of Fruits: the best work of that kind, containing coloured representations, is the "Pomological Magazine," of which there are 3 Volumes.‡——*G. S.*—"Rogers's Vegetable Cultivator" is a good book for a working gardener to procure, in order to become acquainted with the treatment of Sea-kale and Asparagus. ‡

Horticultural Society.—*Pyrus.*—To become a Fellow of the Horticultural Society, you must be proposed by some one who is already a Fellow; your certificate will be suspended for three meetings, on the last of which you are ballotted for. If elected, you have six guineas to pay for your admission fee, and four guineas on the 1st of May in each year *for the year preceding.* In return for this, you obtain the Proceedings and Transactions of the Society free; you are entitled to a portion of the seeds and plants distributed at Chiswick (which, however, are not allowed to consist of common things to be bought in the seed-shops or nurseries); you have free admissions to all the meetings, can send your friends to the meetings in Regent-street without charge, have access to the library, and also the privilege of buying annually 24 5*s.* tickets to the exhibitions for 3*s.* 6*d.* each. The object of the Fellows of the Society is not, however, to save money, but to subscribe a fund that shall be applied to the promotion of Horticulture; and certainly no such stimulus has ever been produced by any other asssociation as by this, which has given away, in medals alone, within the last few years, above 5,600*l.* You can obtain further particulars upon application to the secretary, at the office of the Society, 21, Regent-street, London.+

Exhibitions.—*A Subscriber.*—We always prefer answering inquiries as to facts rather than opinions. We have, however, no objection to saying that we think the Horticultural Society perfectly right. If nurserymen cannot grow plants, we see no reason why they should win prizes. As to medals, the quantity given away by the Horticultural Society is enormous.+——*A West Britain.*—It is very possible that persons at a distance may find it difficult to bring Pelargoniums to Chiswick in good order; but that is one of the disadvantages attending a residence in the country, and the Horticultural Society cannot take it into consideration when rules for general good are settling. Besides, it is still more difficult to bring cut flowers. You should send your plants to some friend's house a few days before they are wanted. We are glad to find that otherwise you approve of the rules, which have been framed, after *much experience*, with a view to nothing except the advantage of Horticulture.+——*E. B.* inquires whether, if under letter A, 12 Pelargoniums be exhibited *all* of *first-rate varieties*, yet *not all* absolutely *new*, they will be disqualified?" Such a collection would not be disqualified: the object in establishing this class is to bring first-rate varieties to the exhibitions, and it will probably be found necessary to introduce a few of the old and finer sorts to complete a set of 12 first class flowers. But if two collections alike in cultivation and equal in point of merit as to the quality of the flowers be exhibited, the one containing the greater number of new varieties will receive the highest prize.*

Thermometers.—*Greenhorn*, who has three of Fahrenheit's thermometers, each varying in its indication of temperature, will be able to judge of their relative value with tolerable correctness, by immersing the bulbs of all of them in ice. The one which approaches nearest to 32° is the best.‡

Stewing Pears.—Δ. inquires why Pears turn red in stewing. We do not remember to have seen anywhere a satisfactory explanation of the cause of this Dr. Kitchiner recommends Pears to be stewed in a bright block-tin saucepan, closely covered up; and observes, that cochineal is generally used to colour them, but that it is not necessary, as, if properly stewed in a tin saucepan, they will acquire a good colour. Many people seem to suppose that there is some virtue in the tin saucepan, and that its use is essental to the colour of the Pears. This is a mistake; for Pears may be made just as red in silver or porcelain as in tin. Chemists have detected in the roots of Apple, Pear, and some other trees, a peculiar substance to which they have given the name of Phloridzin; it is white, but acquires a fine red colour when moistened with ammonia and exposed to the air. We believe that Pears contain a somewhat similar substance, which becomes red when exposed to heat and air. If Pears are stewed in water which is kept from the action of the air by being covered with oil, they remain very pale; whilst if freely exposed to the air they become dark rapidly. *E.*

Seasoning Wood.—*E. H. W.*—We do not know that there is any objection to soaking Oak in lime-water. It is not probable that lime will have so decided an effect on Oak as on Larch, and it will most likely take longer to penetrate into the pores of the former than of the latter wood. There is no reason to expect that the colour of the wood will be injured. *E.*

Worm-casts.—*W. H., Horticultor, and others.*—You may destroy worms by watering the ground with lime-water, prepared by throwing a quantity of quicklime into a large vessel of water, stirring it well, and leaving it for a day until it becomes clear. The quantity of lime is immaterial, provided there is enough of it, because the water can only take up a certain quantity of lime.†

Miscellaneous.—*Dundee.*—Your plants are, 1, Erica echiiflora; 2, E. hyemalis; 3, Gnidia pinifólia; 5, Acácia lophantha. 4, is apparently some species of Phylica.‡——*J. M.*—You can procure a nut of the Tagua Palm or Vegetable Ivory at any ivory-turner's.‡——*Hoppianus.*—Your plants are, 1, Chloranthus inconspicuus; 2, Epidendrum crassifólium.†——*An Old Subscriber.*—We have been getting together information upon the point in question, but we think it better to defer saying anything upon the subject until the end of another season.†——*B. S.* has sent us a bad specimen of Bolbophyllum recurvum.†——*Nicholas Nickleby.*—Your Pelargoniums are all worth preserving, if you grow them for the purpose of exhibition. Sidonia and Lady Bulteel may be dispensed with.*——*S. S.*—Your list does not differ materially from that published; constancy and variety of colour formed a consideration in the flowers selected.*——*R. H. B.*—We are sorry to hear you say so, but are glad to inform you beforehand that the best gardeners are against you.——*A Subscriber.*—The Dahlia is a florist's flower. The Horticultural Society is unwilling to give prizes for florist's flowers except at the shows at Chiswick.——*A. E.*—When seeds germinate, their flour or farina is diminished, not increased. Peas are split by being dried and crushed between rollers; the cause of some boiling hard and others soft is unknown. Salep is prepared from the Orchis-roots, by taking them up when full-grown, parboiling them, stringing them, and drying them in the sun; it principally consists of the subtance called bassorin.†——*T. H.*—The two varieties of Oncidium ornithoryhnchum are well known. There are some others, but those you have sent are the best.†——*Pyrus.*—Such a book would not pay its expenses. If you think it would, only try the experiment.†——*J. D.* can have the Number for August 6th.——*D. V. G.*—Send to the office Nos. 37 and 38 of last year, and we will return you Nos. 6 and 12 of this. No. 30 is out of print. If you will also send the remaining 6 Nos. we will give you half-price for them.——*A Young Subscriber.*—Your Fern is Asplénium Ruta-murária.‡——*D. E. F.*—The seeds are those of the Ricinus communis, commonly called the Palma Christi or Castor Oil Plant.‡——*Potatoe.*—The name by which the sort you mention is generally known is American Native.‡——*W. J. H.*—Your Pear is the Doyenné Gris.‡——*A Young Botanist.*—The larger of your plants is Siphocámpylus bicolor, and belongs to the natural order Lobeliáceæ: the other is Leschenaúltia formosa, natural order Goodeniáceæ.‡——*A Subscriber.*—The subscription to the *Gardeners' Chronicle* is 26*s.* per annum, *if paid in advance.*——*M. P.*—It is impossible for us to judge whether or not it is desirable to plant your border next a small fence; that is a matter of taste to be determined on the spot. There is no reason why you should not plant it if you think it advisable.†——*R. A.*—Many thanks for your papers, which we shall soon use.——*W. W.*—We are quite ready, but cannot at present find room.——*A Constant Reader, Yorkshire.*—The cause of your Apples having the appearance of being frosted is not known. Instances of similar derangement of tissue have been observed in hard, white, clear-skinned Apples, such as your variety is; but only accidentally, and not extending to the whole produce of the tree, as is the case with yours. It will be advisable to graft the tree with a better variety. ‖ We intend shortly to notice Roberts' Treatise on the Vine. ¶——*R. C., Kingston.*—Your Apples are, 2, Downton; 3, White Nonpareil; 5, Cockle Pippin; 7, Grey Leadington; 8, Kirke's Lord Nelson; 9, Beauty of Kent; 11, Manks Codlin; 12, Winter Colman; 13, Norfolk Beaufin; 15, Keswick Codlin; 16, Golden Noble, 20, Dutch Mignonne. Your Pears are, 1, and probably 4, Aston Town; 2, 3, Passe Colmar; 5, Achan; 6, Uvedale's St. Germain; 7, Chaumontel. ‖——*Revd. A. C.*—Your Apples are, 1, Crimson Queening; 2, Lemon Pippin; 3, Nonesuch; 4, Bess Pool; 7, Easter Pippin or French Crab; 8, Hughes's Golden Pippin; 9, Padley's Pippin; 10, Wyken Pippin; 11, Nonpareil; 12, Downton; 13, Beauty of Kent; 15, Golden Noble; 16, Court of Wick; 17, Kentish Fill-basket; 18, Blenheim Pippin; 20, Cockle Pippin. ‖——*Roehampton.*—Your plant is Raphiolepis rubra. The larger of your Pears is Beurré Diel; the other is Passe Colmar † ‖——*H. E. B.'s* grubs feeding upon the stems of the Cabbages will change to a Noctua called the Heart and Dart Moth, or Agrotis exclamationis? whose economy will be shortly detailed in the *Royal Agricultural Journal.* *R.*——*J. S. C.*—We cannot undertake to name one seedsman in preference to another. Your best plan will be to apply to the most respectable one with whom you are acquainted.‡——*A Constant Reader's* plant is Cymbidium sinense.†——*W. Godsall.*—It is not true that Messrs. Longman cannot procure the Horticultural Society's Catalogue of Fruits. If you have any trouble about the matter, send a post office order to Dr. Lindley, 21, Regent-street.‡——*Querist* will find the dimensions of the different sizes of Flower-pots stated at p. 577 of this year's *Chronicle.*‡——*J. R., Ealing.*—Many thanks for your ingenious plan and the communication which accompanied it, but we are afraid it is too expensive to be generally useful. The woodcuts would, moreover, take up more space than, in the present crowded state of our columns, we can well allow them.‡——*G. S.* will find a select list of Peas in our Calendar of to-day.‡——*Devoniensis.*—The seed you sent is that of Araucária imbricata. The term Fructicure is most absurd.+——*Barnes.*—You will be able to strip the inner bark from your dried branches of the Lace-tree without injury, if you previously steep them in water for a few weeks.‡

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The bombardment of Barcelona, which was considered last week to require confirmation, no longer depends on the doubtful authority of the French telegraph The firing commenced on the morning of the 3d, and continued without intermission until midnight, during which time upwards of 800 projectiles were thrown into the city, with the most fatal effect. An unconditional surrender was the result; and the inhabitants are now paying the penalty of their rebellion before a Military Commission. The calamities inseparable from a bombardment have naturally led to much discussion, and great difference of opinion exists on the Regent's policy in resorting to so severe a measure. Without entering into a question which would involve so many minute details, we may simply recapitulate the facts. The insurrection commenced on the 14th November, and lasted for three weeks. Ten days after it occurred, the Captain-General threatened a bombardment; another week elapsed before the arrival of the Regent—during all which time the inhabitants refused to surrender, although they were in hourly expectation that the threat would be literally executed. The Regent, however, waited four days longer; and after all attempts to obtain a surrender had failed, he resorted to this measure as a last alternative. In the mean time the spirit of insurrection had begun to spread among the excitable population of Catalonia, and the existence of the Government depended on immediate action. It is also worthy of remark that, in the hour of peril, the leaders of the revolt deserted the inhabitants, and secured their personal safety by taking refuge on board the French ships of war. Those, therefore, who were the responsible actors in the affair are beyond the reach of the law, and this circumstance, it is believed, will induce the Regent to act with mercy towards the bulk of the inhabitants. The French papers are almost exclusively occupied with the details of the bombardment, which they unanimously condemn. Although there appears no doubt that the insurgents were encouraged by the French Consul, they charge this country with active co-operation in the destruction of Barcelona, and even carry their accusations so far as to assert that the Formidable was run ashore purposely to afford the English officers a pretext for landing ammunition for the bombardment.—From Portugal, we learn that the municipal elections are proceeding in favour of the Government, and that the negotiations for the tariff convention are said to be entirely broken off.—In Prussia, an ordinance has been issued by the King, announcing a reduction in the taxes to the amount of two millions of dollars, and the establishment of several branch railways, to be executed by the Government, or by companies under their control.—By the Levant Mail we learn that the Porte has at length manifested its intention to accede to the demands of the Ambassadors, by appointing a Christian governor to the command of the Lebanon. The provinces on the Danube are still in an unsettled state; and the concentration of large bodies of Austrian troops on the Hungarian frontier is regarded as a proof that the Austrian Government is prepared to resist the contemplated aggressions of Russia on the rights of Servia and Wallachia.

At home we have little to notice beyond the arrival of the treaty of peace between this country and China, accompanied by a letter from the Emperor, expressing his readiness to ratify it as soon as it has received the signature of Her Majesty. Parliament has been prorogued to Thursday, the 2d February, when both Houses will be summoned for the despatch of business.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal remain at Windsor Castle, and are in excellent health. During the fine weather of the past week her Majesty has taken exercise in a pony phaeton, and the Prince has hunted with his pack of beagles in the Great Park. The Archduke Frederick of Austria left Windsor on Friday, and returned to Portsmouth on Tuesday to join his frigate, still lying in that harbour.

Parliamentary Movements.—The Queen held a Privy Council on Saturday, at which Parliament was again prorogued to Thursday, the 2d February; and a proclamation was ordered to be issued, summoning the meeting of Parliament on that day for the despatch of business.—The death of Lord Hill, and the consequent accession of Sir R. Hill, Bart., to the peerage, causes a vacancy in the northern division of Salop. Lord Clive is mentioned as the new Member.

Poor-law Commission.—The Commissioners have appointed Mr. Austin and Mr. Vaughan, the barristers, Assistant-Commissioners for 30 days for the purpose of inquiring specially into the employment of women and children in agriculture.

The National Statues.—Sir R. Peel has confided the execution of the statues which Parliament voted last session to three sculptors from the great capitals of the United Kingdom. Mr. M'Dowall, A.R.A., of Margaret-street, has been selected by him to execute that of Lord Exmouth; Mr. Steele, of Edinburgh, that of Lord De Saumarez; and we observe that at a recent meeting of the Royal Dublin Society, Lord De Grey announced that, on his recommendation, the monument to Sir Sydney Smith had been confided to Mr. Kirk, of that city.

Foreign.

France.—Our intelligence from Paris contains little domestic news, but there is abundance of speculation on the probability of a change of Ministry, the Opposition journals contending that M. Guizot will be obliged to resign even before the meeting of the Chambers.—The papers are unanimous in condemning in strong terms the bombardment of Barcelona. They prophesy Espartero's downfall as the result of this proceeding, but do not wait for accurate information as to the motives which prompted the Regent to have recourse to such an extremity. The papers eagerly avail themselves of the opportunity to express their feelings against this country, and assert that the British Marine Artillery was landed from Her Majesty's ships of war off Barcelona, and employed with frightful effect in the devastation of that city. To this assertion, it is scarcely necessary to say, the advices from Barcelona give unqualified contradiction.—It would appear that the Government are not neglecting the precautions necessary to insure the personal safety of the King. The *Commerce* states, that when the King and Royal Family set out on Friday last from the Tuileries for Fontainebleau, the entire quays along which His Majesty passed were crowded with police agents and Municipal Guards. The carriage of the King was escorted by a strong detachment of Lancers and National Guards.—The trial of the administrators of the Versailles Left Bank Railroad, for the responsibility attached to the frightful catastrophe of the 8th May, has ended, after several days, in the acquittal of the accused. The Court condemned the civil parties demanding damages in the costs, amounting, it is said, to upwards of 10,000f. (400*l.*) This last part of the decision has been regarded as a great hardship for the survivors and the relatives of the unfortunate victims of the accident; but the *Gazette des Tribunaux* explains that the Judges could not decide otherwise according to the law.—The fog which had enveloped Paris for some days last week, extended, it appears, to a considerable distance in the country, and rendered travelling exceedingly dangerous. The Diligence which reached Paris on Sunday morning from Champagne was obliged to proceed at a walk for a length of time, the postilion leading his horses by the light of several lanterns, and the passengers following on foot. The people insisted that the fogs were an importation from England, and that the climate had become British.—In February last, it will be remembered, a number of persons were sentenced to different amounts of punishment by fine and imprisonment for taking part in the disturbances at Clermont. In addition to their sentences of imprisonment, they were ordered to be publicly exposed for the space of an hour upon the Place de Jaude, at Clermont. Last week they underwent this part of their sentence. The scaffold was erected opposite the mansion of M. Conchon, the former mayor of Clermont, to the devastation of which the prisoners had directed their most active exertions. The populace assembled in large numbers, but manifested very little sympathy.—Letters from Havre inform us that the operations for raising the Télémaque, so long supposed to hold enormous treasures, have been abandoned, and that the vessel has been again consigned to the bed of the Seine. The engineer alleges that the advanced state of the season rendered it necessary to postpone the works, and that "they have too many evidences of the existence of treasure on board to think of abandoning the enterprise until the last morsel of the ship and cargo shall have been delivered." On the other hand, private letters mention that the speculators must be content with 20 planks and one cask of tallow, and say that "the only redeeming point in the affair has been the ingenuity and perseverance shown by the engineer, in having succeeded in accomplishing the raising of the vessel, which had vainly been attempted by Government and by private enterprise several times during the last 40 years."

Spain.—The announcement of the bombardment of Barcelona proves to be correct; but the statement of the telegraph that the populace were crying *Vive la France*, and "Down with Espartero and the English," is, as we anticipated, a mere exaggeration. The bombardment commenced at 11 o'clock in the morning of the 3d from the fort of Monjuich, and continued without interruption until 12 at night. 817 projectiles were thrown into the city with dreadful effect. After the firing had ceased, General Van Halen summoned the city to surrender, and allowed the authorities six hours to disarm the free corps, who still held out, and threatened, in case of non-compliance, to resume the bombardment. The authorities called a meeting of the notable inhabitants, and, aided by a considerable portion of the population, succeeded in disarming the insurgents. They then opened the gates. General Van Halen and the troops made their entry into the city about 5 o'clock in the afternoon of the 4th; and General Zurbano followed with another force on the next day. The city suffered materially, but the amount of damage and the number of victims were not accurately ascertained. The houses of a square on which the Municipality stands were particularly damaged, and fires had broken out in different quarters, which were not extinguished on the 5th. The crews of the French ships of war had, by the direction of their Consul, landed their engines, and were rendering every assistance. The house of the French Consul had also sustained some injury. Before the commencement of the bombardment, the soldiers of the militia proceeded in a body towards the French ship, on board of which their officers who had deserted them had sought refuge, and claimed their surrender; but the commander ordered them immediately to depart, threatening to repel them by force if they did not obey his injunction. General Van Halen has imposed a war contribution of 400,000*l.* on the city, and has issued a proclamation, which shows that the hour for reaction has arrived, and leaves no hope of mercy to the guilty. By this decree every individual who does not give up his arms within 48 hours will be punished with death. The state of siege is maintained, and a permanent Court-Martial is established, at which condemnation is followed by immediate execution. The Barcelonese insist that the engineers and artillerymen of the English, as well as their ammunition, did all the mischief, although the crews of the ships-of-war remained on board spectators of the work of devastation. Private letters state that the town can hardly be recognised, and that some of its finest quarters are totally destroyed. Several houses have been burnt, many large magazines entirely ruined, and many of the walls and doors of other houses have been severely shattered by the bursting of the bombs. The pavement was torn up in the streets, for the purpose of forming barricades; the woollen and cotton goods taken from the warehouses of the merchants, and heaped up in piles to deaden the effect of the shells and round shot; beds, mattresses, and every description of household furniture which could be put to a similar use, were employed for the purpose of forming some shelter against those terrible missiles. Fortunately, not many lives were lost. In the midst of the firing, a party of men and women were observed in the streets singing, and the Barcelona papers remark the singular fact that at such a time so much coolness and indifference to danger should have been shown. The sounding of the tocsin or *somaten* is said to have had an extraordinary effect on the people of the neighbouring towns, and the danger of having another outbreak in his rear is said to have determined the Regent to adopt the bombardment which had been threatened by Gen. Van Halen some days before his arrival. The mode in which the town surrendered was the meeting of the inhabitants, on the night of the bombardment, when a junction was formed, principally of the curates of the parishes. These, by entreaties, prevailed on the desperadoes to lay down their arms, for which three hours were given. Communications were of course opened with General Van Halen, and the surrender took place. It is a circumstance which ought to be borne in mind, that all the chiefs of the revolt deserted their victims in the moment of danger, and took refuge under the French flag. The British Consul ordered the British vessels in the roads to hoist the national flag, and to admit on board all foreigners, no matter to what nation they might belong, who applied for admission, with the exception only of Spanish subjects. Both the Paris and the Madrid journals reprobate the decision of the Consul, as an unprecedented occurrence in the records of civilised nations. The Formidable having been got off the point of Llobregat, upon which she had struck, has left the harbour for Malta, in tow of one of the Government steamers. It appears that she lost her rudder, and suffered some other damage from the accident, being found to leak considerably on getting afloat. The new Bishop of Gibraltar and some of his friends were on board. On the signals of distress having been heard at the head-quarters of the Regent, his Highness's secretary was immediately sent to the spot to offer all the assistance possible under the circumstances.

Portugal.—We have Lisbon news to the 5th inst. The municipal election was going on in the metropolis, and the Government had been so far successful that it was probable that the great bulk of the Municipal Chamber would be composed of its adherents. Some alarm had begun to prevail at Lisbon in consequence of the anticipated conclusion of the English commercial arrangement with Spain, which would naturally put a stop to the lucrative transit-trade now enjoyed by Portugal in English cotton-goods, which yielded no inconsiderable portion of the customs' revenue of Lisbon and Oporto. It was not known whether the Portuguese Government were prepared to make such a further advance upon their former propositions on the tariff question, as to allow the convention to be concluded. Lord Howard de Walden had exchanged ratifications of an additional article to the slave-trade treaty, securing to the slaves taken from captured vessels the benefits of any alterations in our colonial regulations tending to improve their condition. The negotiations for the tariff convention are said to be entirely broken off. The patriarch elect has made his submission to Rome, but refuses to commit the privileges of the Portuguese church. The coast of Portugal had been visited by fresh storms, and two English vessels had been wrecked; one, the Chatham, bound for New South Wales with emigrants; the other, the Wexford, with a cargo of coals, bound to Malta.

Germany.—A royal ordinance has been issued by his Majesty, relating to a diminution of taxes, and the establishment of a number of branch railroads. The reduction in the taxes is estimated at two millions of Prussian dollars, of which one million nine hundred thousand dollars are to be allocated to diminish the price of salt, and so relieve the indigent classes. The proposed railroads are to be executed by the Government, or by companies, to whom the State will guarantee a certain rate of interest.—It is reported that the Prussian Government seriously contemplates to free all publications, without regard to their extent, &c., from the censorship, with the exception, however, of the journals, and that negotiations for this purpose have already been commenced with the German Diet.—We learn from the recent papers, that the negotiations between the French and Prussian Governments for a modification of the increased duties imposed by the Zolverein, at the last Stuttgardt Congress, on French goods, were actively pursued; but it was doubted whether they would be concluded in sufficient time to prevent the new tariff from coming into force.

Belgium.—The Sections of the Second Chamber are still occupied with the details of the treaty with Holland, but their proceedings at present offer no topics of general interest. The steamer Antwerpen, from London, ran aground to the west of Blankenburg last week, on her voyage to Antwerp. She had thirty passengers on board, and a large quantity of merchandize. After remaining on the sands for some hours, she got off, and proceeded without much damage.—Letters from Rio state that M.

Van Lede, the Belgian delegate, had concluded with the Brazilian Government a contract relative to a colonial establishment, and had examined several localities in the province of Santa Catherina for the purpose of choosing a position suited to the object of his Government.

Russia.—The arrival of Baron Lieven, the Russian ambassador, at Semlin, and his interview with the ex-Prince of Servia, are announced; but it is not stated whether he would recognise or repudiate the newly-elected Sovereign. Some Hungarian journals contain a vague threat of a coalition of Austria, France, and England against Russia, should the Czar persevere in attacking the rights of the Hungarian people as to the principalities of the Danube.—Two new steamers, of about 800 tons each, with engines of 260 horse power, are now in the East India Docks, on the point of departure for Constantinople. They have been constructed in London for the Russian Government, and are, it is said, destined to ply in the Black Sea and the Bosphorus.

Turkey.—By the Levant mail we learn that the Pacha of Egypt has paid into the Turkish treasury the whole of the tribute which he was bound to pay to the Sultan by the treaty of 1841. The affairs of the Danube are still the leading subjects of attention. Letters from Bucharest of the 26th ult. announce that the Assembly of the States would not be convened to elect a new Hospodar, but that the Prince would be appointed by the Cabinet of St. Petersburgh in conjunction with the Ottoman Porte. The Russian General Suwarrow had arrived at Bucharest, where his presence had created considerable sensation. Advices from Pesth of the 3d inst. state, in confirmation of what has been stated above in our Russian news, that an Austrian army of 30,000 men was to be concentrated on the frontiers of Servia, and that Austria would in all probability espouse the cause of Prince Michael, should Russia support the pretensions of Prince Alexander. Subsequent accounts, in reference to the affairs of Syria, mention a report that Sarim Effendi had given reasons to Sir S. Canning to believe that the Porte would consent to the nomination of a Christian governor for the Maronite districts, and that the choice would probably fall upon a younger son of the Emir Beschir.

China.—Major Malcolm, Secretary to the Embassy in China, arrived in town on Saturday, with the Treaty of Peace between that country and Great Britain, and a letter of assent from the Emperor, expressing his readiness to sign it immediately it shall have received the signature of her Britannic Majesty. It bears the signatures of the three High Commissioners sent by the Emperor to Nankin for that purpose. Capt. Whittingham, with despatches from Sir Hugh Gough, has also arrived in town, and has brought a number of Chinese standards, captured by the British army during the recent operations. They bring no news of any interest beyond that already communicated to our readers on the arrival of the Overland mail. In connexion with our present prospects in China, it is announced that the Society for the Propagation of the Gospel in Foreign Parts intend to establish a mission at Hong-kong, and will raise a special fund for that purpose.

United States.—The packet-ship Roscius, from New York, arrived at Liverpool on Wednesday, and the mail steamer Acadia arrived yesterday from Boston and Halifax. The papers received by this conveyance come down to the 4th inst., but their contents are unimportant. The rumoured changes in the cabinet are still discussed, but the official papers state that no modifications are likely to take place either before or after the approaching Session of Congress. The tonnage-duty charged on the British Queen, of which the Belgian Government had complained, had been refunded to the Consul of that Government. No doubt was therefore entertained that relations between the United States and Belgium would be restored to their former footing, immediately on the fact being known to the Government of Belgium.—A destructive gale had taken place on Lake Erie. The Buffalo papers describe it as most terrific. The wind blew a hurricane, and the air was so filled with snow that an object could scarcely be seen 20 yards distant. The cold was intense, and the suffering severe in consequence of the entire want of preparation for so sudden a visitation. Eleven vessels were wrecked, and a number of lives lost.

Mexico and West Indies.—Advices have been received from Havannah, *viâ* New Orleans, to the 8th ult. The mail steamer Thames had arrived at Havannah from Tampico, with advices from the capital of Mexico to the 23d October. General Brovo arrived on the 20th, and immediately entered on the duties of his office, as President *ad interim*. His Excellency had declared the State of Yucatan in a state of blockade, and the expedition against that country had sailed from Vera Cruz, consisting of 15 sail, and carrying 3,900 troops. Mr. Turnbull, who had been arrested on landing on the island, was brought to Havannah on the 3d ult. as a prisoner. His arrival caused great excitement in the city. There was even a talk of putting him to death; but through the exertions of the British Consul his sentence was changed to an order for immediate departure from the island, and a prohibition ever to return. On the 6th he was on board the Thames, for Nassau and England. A private letter says, that "Mr. Turnbull pleaded insanity, which plea was admitted, to save trouble, and he was pronounced lunatic."—The advices from Texas are to the 4th ult. General Woll had retreated from San Antonio, taking with him about 70 prisoners.—A vessel arrived at New York from San Juan, reported that the blockade by the British fleet was raised on the 20th September, and the fleet sailed the next day for Cusope.

New South Wales.—Advices have been received from Sydney to the 25th June. They give an account of the reception of Dr. Selwyn, the Bishop of New Zealand, and the Rev. W. Cotton, of Christ Church, his Lordship's chaplain, by the bishop and clergy of the Church of England within the diocese of Australia, previously to their departure for the scene of Bishop Selwyn's future labours. The ceremony is said to have been one of peculiar interest, for at the conclusion of an address made by the Bishop of Australia in the name of the old body of clergy, Bishop Selwyn knelt down and received his parting benediction, the solemnity of which moved the auditory to tears. The Bishop sailed for New Zealand on the 19th May.—The rates of wages are stated to be as follows during the summer of 1842:—Agricultural labourers, 22*l.* per annum, with rations of meat, flour, tea, and sugar; shepherds, 24*l.*; carters, 28*l.*; domestic servants, 25*l.*; mechanics, from 40*l.* to 56*l.* a-year. The above refers to country districts only. The wages of women are as follows:—Cooks, 14*l.* to 30*l.* a year; dress-makers, 9*l.* to 16*l.*; dairy-maids, 12*l.* to 30*l.*; farm-servants, 10*l.* to 15*l.*; general house-servants, 10*l.* to 18*l.*; housemaids, 12*l.* to 15*l.*; housekeepers, 8*l.* to 20*l.*; ladies'-maids, 8*l.* to 13*l.*; laundresses, 12*l.* to 26*l.*; needlewomen, 10*l.* to 14*l.*; nursery governesses, 6*l.* to 15*l.*; nursemaids, 5*l.* to 13*l.* These rates are taken from a return appended to the immigration report, said to have been prepared by the superintendent of police.

New Zealand.—We have advices from Kororareka, New Zealand, of the 26th May, which give the particulars of a public meeting, held at Auckland, about the beginning of that month, Mr. Coates, high sheriff, in the chair, for the purpose of adopting a petition to both Houses of Parliament, praying for representative institutions, to which, as they assert, "this rapidly-rising colony is justly entitled." The petitions to the Queen and to Parliament were read and unanimously adopted, setting forth—"That many of the British colonies are in the enjoyment of Legislative Assemblies, without possessing the population, wealth, revenue, or commercial importance of New Zealand, which although it has virtually been a British colony for three years only, has still been inhabited and partly occupied by a large body of British subjects for upwards of thirty years. That the expenditure of the government of this colony has during the last two years amounted to upwards of 130,000*l.*, and is likely to increase considerably. That the petitioners cannot, however, exercise the slightest control over the appropriation of the revenue of the colony, which is entirely under the control of his Excellency the Governor, three executive members of Council, and two non-official members, chosen by the Governor, and irresponsible to the people. The petitioners, therefore, humbly pray that Parliament will be pleased to adopt such measures as may seem proper for extending to the colony of New Zealand that form of representative legislation to which it is constitutionally entitled, and which it is now fully qualified to exercise." The papers also contain the Speech of the Governor to the Council at the close of the session. The most important objects to which it refers are the establishment of a system of local government, and the adoption of new laws. "I believe," says the Governor, "that the statute-book of New Zealand for the present year contains a more important code of laws than was ever passed by any colonial legislative body during a single session, and I cannot but esteem it a privilege to have had an opportunity of taking part in laying the foundation of the youngest and most distant, but by no means the least important of the numerous colonial dependencies of Great Britain. During the present session, provision has been made for the efficient administration of justice, in all its various branches, with a due regard to the existence of scattered settlements, rapidly increasing in number and extent. For this purpose, the ordinances for establishing a supreme court and county courts, and indeed all the ordinances of the session, have been based upon the principle of localising the machinery of the government of each separate settlement, and of rendering them as independent as possible of the capital. Circuit courts have been established to sit twice a year, and local courts to sit monthly, for the despatch of both civil and criminal business. By leaving to the various settlements the management of their own local affairs, the general government will be relieved of a duty it could but ill perform. The inhabitants of each them will be interested in developing its resources, and in making it as attractive as possible to the emigrant; and by this means an honourable rivalry will be created, and the prosperity of the colony at length ultimately promoted. That the opposition which this measure met with in its most popular principles, during its progress through the Council, should have been led by one who was selected as representing the colonists of the New Zealand Company's principal settlements, a body of people bringing with them in all its freshness, unimpaired, the English love of liberty, may well form a subject of astonishment and regret." The Governor concludes by referring to the bill for the settlement of the land-claims question, and regrets that he was obliged to withdraw it. He believes that "the motives of the Government were then generally misrepresented, vilified, and impugned. I believe the time is not far distant when it will be as generally considered, that the original land-claims bill would not only have promoted the successful colonisation of the country, but would, at the same time, have materially advanced the interest of the claimant."

Parliament.

HOUSE OF LORDS.

Tuesday.—This being the day to which Parliament stood prorogued, both Houses met *pro formâ*. The Lord Chancellor, the Earl of Haddington, and Lord Fitzgerald and Vesci, as lords commissioners, having taken their seats in front of the Throne, the Usher of the Black Rod was directed to summon the House of Commons, to hear the Royal Commission read for the further prorogation of Parliament. In a few minutes afterwards, the Commons, who were represented by Mr. Hindley, M.P., and the clerks and officers of the House, appeared at the bar, when, the Royal Commission having been read, the Lord Chancellor, in the usual form and words, declared the present Parliament to be further prorogued until Thursday, the 2d of February next; and added, "then and here to meet for the despatch of divers urgent and important business."

CITY.

Money Market, Friday.—Consols for the account closed 93⅞ to 4, ex div.; Bank Stock, 173; Three per Cents. reduced, 94½ to ⅝; Three-and-half per Cents. Reduced, 101 to ⅛; India Bonds, 43*s.* to 45*s.* prem.; India Stock, 260 to 262; Exchequer Bills, 50*s.* to 52*s.* prem.

Metropolis and its Vicinity.

Court of Aldermen.—On Saturday an unusually full attendance of the committee appointed by the Court to investigate the charges against Alderman Thomas Wood, with respect to the Talacre Mining Company, took place at Guildhall, for the purpose of proceeding with their inquiry. Alderman Brown acted as chairman. The first subject of discussion was a letter from Alderman T. Wood, in which he condemned the course pursued by the committee, as calling upon him to make charges against himself instead of having charges made against him. He expressed his right to assume that certain proceedings which had taken place in the Court of Queen's Bench concerning the Talacre Mining Company had been construed into charges against him by his brother Aldermen, and had induced them to reject him from the Mayoralty. He called upon them to state the nature of those charges, and as soon as any definite charge was made he would not only be prepared to meet it, but he would at once place all the books and documents as well as affidavits in the case of the Talacre Mining Company before the Court. The Chairman said this communication was a perfect insult to the Court of Aldermen, as it charged them with that which was not true. They had made no charge whatever against Alderman T. Wood, and there was no charge against him but what he had himself furnished, in placing in their hands the judgment of Lord Denman. If there had been any cause for the Aldermen rejecting Alderman T. Wood on Michaelmas-day last from filling the civic chair, it might probably have been founded on the judgment of the Lord Chief Justice of England, placed in their hands by Alderman T. Wood himself, and in which certain frauds were imputed to him. An angry discussion now ensued, in which Alderman Wood declared that the chairman had forgotten his position in the chair, and demanded that the judgment should be read. Much confusion prevailed amongst the Aldermen for some minutes, and, after considerable opposition from the chairman, the judgment of Lord Denman was read. A long and desultory conversation ensued, of little interest except to the parties concerned, and at length the Common-Serjeant suggested a resolution, that all documents with respect to any charge to which reference had been made in the Court of Aldermen should be put in and accepted by the committee, Alderman T. Wood having power reserved to him to refer to any other matters as occasion might require. After some opposition in the committee, Alderman T. Wood assented to this proposition; and, on the motion of Sir Peter Laurie, it was ultimately adopted. The meeting was then adjourned till the last week in January.

Testimonial to Sir John and Lady Pirie.—A private meeting of merchants, bankers, and others, took place at the London Tavern last week in consequence of a desire expressed at the conclusion of the late mayoralty, to consider the propriety of testifying their approval of the public and private character of the late Lord Mayor and Lady Mayoress: Mr. Cotton, the Governor of the Bank of England, presided. It was suggested, that for the purpose of accomplishing the object in the most effectual manner, it would be advisable to call a public meeting, and submit resolutions for their adoption. To this proposition the chairman and others entertained some objection, on the ground that the immediate appointment of a committee, treasurer, and secretaries, would answer every purpose, without any parade of a public meeting, at which, after all, nothing could be uttered except language in praise of those who were the theme of their approbation. It was ultimately agreed that operations should commence without having recourse to a public meeting. A committee was then appointed, with power to add to their numbers. The subscriptions at once commenced, the maximum being fixed at 5*l.* for a single subscription, with no minimum limit. On Friday, the committee again assembled, and after some other arrangements, resolved that the testimonial should be approved by the majority of the general committee, and afterwards by a majority of the subscribers at a general meeting.

Royal Academy.—On Saturday, being the seventy-fourth anniversary of the foundation of the Royal Academy, a general meeting of the academicians was held in Trafalgar-square, when the annual prizes were awarded to the following students:—To Mr. J. C. Hook, for the best copy made in the painting school; to Mr. A. Rankley, for the next best copy made in the painting school; to Mr. J. C. Hook, for the best drawing from the life; to Mr. J. Clayton, for the best drawings of the ground plan and section of the church of St. Stephen, Walbrook; to Mr. J. Harwood, for the best drawings from the antique; and to Mr. A. Gatley, for the best model from the antique. The general meeting afterwards proceeded to appoint officers for the ensuing year, when Sir Martin Archer Shee was unanimously re-elected president, and the usual routine changes took place in the council and other officers of the institution.

Death of Lord Hill.—The Shrewsbury papers for some weeks have mentioned the increasing infirmities of this distinguished general. His death, therefore, which took place on Saturday at his seat, Hardwicke Grange, near Shrewsbury, was not unexpected. Lord Hill's military career is intimately connected with some of the most brilliant passages in the history of the British army. In 1801, he was engaged in the campaign in Egypt, and was present at the surrender of Grand Cairo by the French. As brigadier-gen. he commanded the reserve of Sir John Moore's army at Corunna. At the battle of Talavera, the brigade under his command repulsed the French at the point of the bayonet, for which he was rewarded with the thanks of Parliament. He was present at the battles of Busaco, Vimiera, Vittoria, Nivelle, Toulouse and Waterloo, and in 1814 was raised to the peerage as a reward for his public services. In 1825 he was made general, and in 1828 was appointed commander of the forces, which office he continued to hold until August last, when he resigned in consequence of declining health, and was succeeded by the Duke of Wellington. His lordship was the son of Sir John Hill, Bart., of Hawkestone, in the county of Salop, and nephew of the late Rev. Rowland Hill. He was in his 71st year, and took little part in politics. He was unmarried, and is succeeded in his title by his nephew and heir, Sir Rowland Hill, Bart., M.P.

Smithfield Club.—The forty-second anniversary of this society was held on Monday evening, at the Freemasons' Tavern, Earl Spencer in the chair. The attendance, although not so numerous as on some former occasions, included a large number of noblemen and gentlemen well known as experimental agriculturists. Among those present were the Duke of Richmond, Lord Ducie, Lord Monteagle, Mr. Pusey, &c. In reference to the late Cattle Show, Lord Spencer said that the number of animals was greater than usual, although some were certainly of an inferior description. He had no hesitation in saying, that he remembered shows in Smithfield in which the chief prizes would have been carried off by third-rate animals in the present exhibition. The size of the animal was not the only thing to be looked to—the supply of the markets with the cheapest and best meat was the main object. It was a mistake for persons to inquire "what is the use of bringing such extremely fat animals to market?" They were a test of what could be done with that particular class of oxen with ordinary feeding. The meeting was afterwards addressed by other noblemen, but the topics alluded to were not of general interest.

Parish of St. Bride.—On Monday a Vestry was held in this parish, the Rev. Mr. Dale in the chair, when the churchwarden read her Majesty's Order in Council, assigning an ecclesiastical district to Trinity Church. The chairman stated that the pew rents of the church produced 822*l.* 6*s.* 9*d.*; that the endowment fund realised 1,500*l.*; and that the probable income of the clergyman would be about 250*l.* to 300*l.* a-year. Before the close of the meeting, the chairman stated that the money paid by the communicants at Trinity Church in 1841 equalled that paid by them for the same charitable purposes in 1824 in St. Bride's.

Westminster School.—Christmas has been ushered in as usual, by one of the comedies of Terence, acted by the Queen's scholars of St. Peter's College. A melancholy occasion having last year prevented the recurrence of the "Westminster play," the dormitory was on Monday evening thronged with a very numerous audience. The play produced this year is the *Adelphi*, which has been brought out with strict attention to classical costume, and sustained with great spirit by the scholars. The prologue and epilogue were not spoken till Thursday, and the copies will not be distributed till Monday, when the last performance will take place.

London Diocesan Board of Education.—The report of the committee of this Board, which has just been published, states, that during the last year a systematic inspection of the schools, in connexion with the Board, and with the National Society, has taken place. These schools amount in the whole to 230, the greater part of them being situated in London. The report also states that of the churches recently erected there are few to which schools are not attached, and in which reading, writing, and the rules of arithmetic are not generally taught. In some instances the musical systems of Mr. Hullah and Mr. Turner are now adopted, and the knowledge of arithmetic conveyed on the Pestalozzian system. The writing of boys and girls in most of the schools is described as inefficient; but their moral and religious improvement, though mechanical in its manner of being taught, is stated to be satisfactory.

Charter-house.—The anniversary, instituted in honour of Thomas Sutton, the founder of the Charter-house in 1611, was celebrated on Monday. A large number of Carthusians were present. The Bishop of London preached the annual sermon in the chapel of the establishment; after which an oration in Latin was delivered by Mr. W. P. Hale, son of Archdeacon Hale, the master. It dwelt on the recent decease of the Rev. Dr. Fisher, who had been 38 years master of the school, and on that of the Earl of Westmoreland, one of the late governors. The speaker concluded, amid much applause, with some well-expressed compliments to the Bishop of London. After inspecting the chapel and the hospital, which contains upwards of 80 infirm and aged men, the governors and members dined together in the large hall. During the day a dinner was given to the boys, and to all the pensioners connected with the charity.

Metropolitan Churches.—There are now 12 new churches building, or about to be commenced, in various parts of the Metropolis: one in the Kent-road, in the parish of St. George, Southwark; one in Paddington; another on the site of Old Broadway Chapel, Westminster; another in Wilton-square, Knightsbridge; three in Bethnal-green; and a church in St. Pancras. Sites have been chosen for a new church in the Waterloo-road; another in St. Botolph Without, Aldgate; and a third in St. George's in the East. The new parish church of St. Giles's, Camberwell, building on the site of the old edifice, which was destroyed by fire, is proceeding rapidly.

Metropolitan Improvements.—The following extract from the Report of the Commissioners of Woods and Forests will show how much has been accomplished in the negotiations for the new lines of streets, to which we have frequently adverted:—"Up to the 5th of January last we have completed purchases in three of the lines of the projected improvements, to the amount, in the aggregate, of 120,804*l.*, and have contracted for purchase in all those lines of improvement to the further aggregate amount of 122,742*l.*—viz., 1. In the line from Oxford-street to Holborn, we have completed purchases to the amount of 115,743*l.*, and have contracted for purchases to the further amount of 5,310*l.* 2. In the line from Bow-street to Charlotte-street, Bloomsbury, we have not completed any purchase, but have contracted for purchases to the amount of 11,385*l.* 3. In the line from the London Docks to Spitalfields Church, we have completed purchases to the amount of 3,261*l.*, and have contracted for purchases to the further amount of 29,360*l.* 4. In the line from Coventry-street to Long-acre, we have completed purchases to the amount of 1,800*l.*, and have contracted for purchases to the further amount of 76,687*l.* In the foregoing statement of purchases made and contracted for, we have included those cases only in which the purchase-moneys have been fixed. We have entered into contracts for many other purchases in each of the lines of projected improvements, at prices which remain to be ascertained by arbitration. 5. We have not yet purchased or contracted for the purchase of any part of the ground and houses required for the formation of the new street from East Smithfield to Rosemary-lane; but we have caused notices to be given to the freeholders on this line, pursuant to the Act of Parliament, that their premises will be required, and that we are ready to treat with them for the purchase thereof."

Victoria Park.—We find by the Report of the Commissioners above quoted, that the Act passed in the last session of Parliament, for enabling the Board to complete the contract for the sale of the lease of York House, and to purchase certain lands for forming the Victoria Park between the Hackney and Whitechapel roads, did not contain all the requisite powers for effecting the latter object, and was, therefore, in a great degree inoperative. They state, however, that notices having been given of an intended application to Parliament, in the present session, and a Bill for giving extended and necessary powers having been introduced early in the session, and passed into a law, they are now proceeding to deal with the parties whose properties will be required, and to take the other necessary measures for executing the improvements.

New Houses of Parliament.—We lately noticed the progress of the works already contracted for. It is now announced that the fifth contract has been entered into, and that Messrs. Grissell and Peto are again the successful competitors. This contract is by far the most extensive that has yet taken place, embracing the Victoria Tower, the Royal Gallery, the Houses of Lords and Commons, with other important portions of the work.

The Colosseum.—We see by the advertising columns of the daily papers, that this well-known building, the "great lion" of the Regent's Park, is to be brought to the hammer by Mr. Geo. Robins. It has already been appropriated to so many different purposes, that it will be curious to see what will be its next rank among the sights of the Metropolis.

Anti-Corn-law Meeting.—On Wednesday night, a district meeting of the Metropolitan Association was held at Hoxton; Mr. Warburton presided, in the absence of Col. Thompson. Mr. Villiers, M.P., spoke on the Corn-law question, and proposed a resolution in support of the League Fund. This was seconded by Mr. Coates, the distiller, of Whitechapel; after which a disturbance arose, in consequence of some Chartists having attempted to address the meeting. The tumult at length became so great that the police were called in, and, after considerable delay, two or three Chartists obtained a hearing, and proposed an amendment, to the effect that nothing but the destruction of class legislation, and the adoption of the principles of the Charter, could do any good for the country. This amendment was supported by about fifty hands, and the original motion was declared to be carried.

Model Prison.—On Saturday evening the interior of this new prison for the reception of criminal offenders was lighted up for the first time, the whole of the arrangements for the reception of convicts being at length completed. It was anticipated that a certain number of convicts would have been removed to the prison on Thursday, and every arrangement was ordered by the Commissioners to be made for their reception; but as it was found necessary to reconsider the dietary on Monday, and to make some alterations in the rules, which were on Tuesday transmitted to the Home Secretary for his approval, no prisoners will be received this week. The prison, however, will certainly be open before Christmas. The Bishop of London has appointed to-morrow for the consecration of the Chapel.

Public Meetings.—On Thursday, the 8th inst. a meeting of the gas consumers and householders of Marylebone was held, for the purpose of taking steps to destroy the gas monopoly in the borough, by the formation of a company, to comprise the consumers of gas themselves, upon the same principles as the Commercial Company, recently established by the tradesmen and consumers of the eastern portion of the Metropolis. It was stated that this company had proved that they can obtain a reduction of 30 per cent. in the cost of this necessary article of trade, and at the same time give a profit to the shareholder. At the eastern end of London the price was 7*s.* per 1,000 feet, while the old companies charge 9*s.* A provisional committee was formed to carry out the object.—On Saturday night a meeting of the journeymen bakers was held, to adopt measures to secure to them fair wages, and protect them from the excessive labour to which they are subjected. A deputation from Dublin was in attendance. Several statements were laid before the meeting in regard to the condition of the journeymen bakers. It was stated that they worked for twenty hours a day in places worse than the condemned cells of Newgate, while their wages did not exceed 12*s.* or 20*s.* a-week. The condition of the masters was also said to be very serious, and it was ultimately resolved to appoint a committee to effect a union between the masters and men, for the purpose of redressing their grievances.—On Monday, a meeting of the master-tailors who had combined in 1834 for the purpose of resisting the strike of their workmen was held, to consider the best means of disposing of the balance of the fund raised to defray expenses. The leading firms in the Metropolis were present. It was resolved that they could not appropriate the surplus of the fund they had many years ago raised for the purpose of opposing the men, better than by expending it in their support; and the balance in hand of 77*l.* was accordingly given to the building fund of the institution for the relief of aged and infirm members of the trade.

Tea Trade.—The Chinese news by the recent Overland mails has produced, as was expected, a decline in the price of teas, many qualities having receded from 2*d.* to 4*d.* per lb. The best black teas, however, appear to have maintained their price; and it is considered that the continuance of the present rates depends entirely on the quantity that may be brought into the market for the next few months. The imports of tea into London this year up to the 1st instant were 29,421,368lb.; last year they were 16,358,818lb. to the same time. The deliveries this year are 32,479,911 lb.; during the first eleven months of last year they were 30,635,963lb., showing an increase of about 13,000,000lb. in the arrivals, and of 2,000,000 lb. in the consumption. —The Glasgow East India Association have transmitted a memorial to the Treasury, praying for a material reduction in the duty on tea, and the establishment of fair reciprocity with China. They say that the direct trade of this country to China had seldom exceeded 1,200,000*l.* per annum, and the annual trade from China has seldom exceeded 4,000,000*l.*, both sums exclusive of what passes through the medium of America and Australia; the difference between the two being made good chiefly by the opium and cotton exported from British India, the former to the annual value of 3,000,000*l.*, and the latter of upwards of 1,000,000*l.*, whilst the balance of trade against China has been paid in bullion. They state that the miscellaneous articles admit of little increase; that tea, the great staple of China, is already imported to as great an extent as the consumption, limited by high price, will allow, and that a reduction of duty on black teas, by one half, would not only facilitate the formation of a fair tariff with China, and increase the amount of our exports, but would greatly add to the comfort of the poorer classes, and materially increase the consumption of sugar.

The Weather.—A change took place in the weather on Monday night. The atmosphere, after being cold and damp, suddenly changed to the genial mildness of spring, and for some days more resembled the fine weather of May or June than the middle of December, the sky being unobscured by clouds, and the sun having shone out with warmth and brilliancy.

Fires.—A fire occurred on Wednesday night in Little Prescott-street, Goodman's Fields, which was unhappily attended with loss of life. It was discovered about 10 o'clock, but it had already made such progress that the police were unable to force a passage up the staircase, in consequence of the smoke and heat. As all chances of escape were thus cut off, two sisters threw themselves from the window of the second floor, a height of more than 35 feet; one was killed on the spot, and the other was so seriously injured that it was necessary to carry her to the London Hospital. As soon as the flames were somewhat subdued, the fire brigade searched the premises by means of scaling ladders, in order to ascertain if any persons had perished. The bodies of three children were found on the second floor, and those of an elderly female and three children in other parts of the premises. It was impossible to identify the bodies, as they were burnt to a cinder. An inquest was held yesterday, when a verdict of accidental death was returned. The circumstances that transpired add little to the main facts stated above; but the evidence appears to show that the police did not render effectual assistance, and that the children were saved by the exertions of a neighbour, who states that he could not induce the officers to follow him.

Police.—An attempt at murder and suicide was committed on Monday at the Auction-Mart Tavern, the pot-boy having shot the barmaid, and afterwards cut his throat. The man was taken to St. Thomas's Hospital; and both parties are likely to recover. The details have appeared at some length in the daily papers, but they have little interest for the public.

Hackney.—An adjourned meeting of owners of property in this parish was held on Wednesday, the 7th inst., to determine on the instructions to be given to the valuer in apportioning the tithe commutation rent-charge of 931*l.* 10*s.*, lately fixed by the commissioners; Mr. J. R.

D. Tyssen in the chair. A long and angry discussion arose on the amount of the rent-charge, and a motion was made for the appointment of a committee, in order to procure from the tithe commissioners all the evidence on the subject laid before them, and report the same to another meeting of owners. After considerable discussion, some principles of a general character were agreed upon for the guidance of the valuer. To the resolution embodying them, an addition was proposed to the effect that, in passing it, the meeting expressed no approval of the amount at which the rent-charge had been fixed. The show of hands was in favour of the addition, when proxies were produced. The result of the division then gave equal numbers, and the motion was at length negatived by the chairman's casting vote. It is understood that an application will be made to the commissioners to reconsider their award.

Woolwich.—A casting of about four cwt. of brass took place on Thursday, under the superintendence of Mr. Clarke, being the quantity of metal required for each leaf of the Corinthian order to be appended to Lord Nelson's monument in Trafalgar-square. The leaf now cast completes the requisite number, and the artist is about to commence casting the volutes, which will still occupy him a considerable time.—The Sultana, Arab ship-of-war, belonging to the Imaum of Muscat, sailed from the River on Saturday week. During her stay, the captain appeared several times before the Lord Mayor for the purpose of getting married to an English woman; and several representations were made which induced the City authorities to advise the female not to risk the consequences. The Ambassador of the Imaum also interfered, and gave orders that neither the captain nor any of the crew should marry in England. During her stay in this dockyard, the vessel underwent a thorough refit, by order of the Admiralty.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Dec. 3, was 882—Males 446, Females 436. Weekly average 1838-9-40-1: Males 487, Females 445. The distribution of this mortality over the different districts was as follows:—West Districts, 129; North, 193; Central, 160; East, 193; South, 207.

Provincial News.

Agricultural Districts.—The following incendiary fires have been reported since our last: In Nottinghamshire a large stack has been burnt down on the farm of Mr. Savage, the property of Lord Rancliffe, at Bunny; the stack, which was 40 yards long, was fired in the centre, and was consequently destroyed with great rapidity. Another stack was fired on the following night, on the farm of Mr. Wheatley, at Whatton in the Vale, but the flames were prevented from spreading to the other contents of the yard. In Wiltshire, a cattle-skilling and rick of hay on the farm of Mr. Chillingworth, of Queen Lanes, near Highworth, have been destroyed, together with the cows which were tied up in the stalls. In Oxfordshire, an attempt was made, on Sunday evening, to set fire to the farm of Mr. Jarvis, on the property of Sir Harry Verney, at Steeple Claydon, but the flames were discovered in time to prevent their spreading. The next night, the barn, stable, and hovel, on the farm of Mr. Robins, at the same place, were burnt down, and the dwelling-house fired in two places; large rewards have been offered for the apprehension of the offenders.

Buckingham.—The annual dinner of the Buckinghamshire Conservative Association took plate at Brill on Thursday. The meeting, though a large number of the leading farmers were present, was not attended by any member connected with the county. The principal feature of the meeting was the speech of the Duke of Buckingham in reference to the recent changes in the Corn Laws and Tariff. "The opinions," said his Grace, "which for many years as member for your county, and the opinions which, as an individual Peer, I have since expressed, are so well known to you and to the country, that to repeat them on the present occasion would tire you, and take up more time than they are worth. But, at the same time, I must be permitted to express my unaltered opinion with regard to those measures which have recently been passed affecting the agricultural interest. Whatever changes may have overtaken some, those changes of opinion have not altered mine. I gave my votes and I gave utterance to my opinions formerly, as I do now, and with a perfect conviction on my own mind that these opinions are founded in honesty and truth. I thought it my duty many years ago to record those opinions, because then, as now, I took an active part in doing whatever I humbly can to further the objects and promote the interests of the British agriculturist. Those opinions remain firm and unchanged—those opinions remain unaltered;—and I look back with regret, and with deep regret, to the passing of the new corn-bill and the tariff, which I regard as hostile and dangerous to the interests of the British farmer." He proceeded to say that he thought it due to them that he should freely and unreservedly repeat over and over again his opinions, in order that whatever mistakes might be made in these times with regard to the opinions of some gentlemen in the country, there might be no mistake made with respect to his own. His opinions, as he said before, remained unaltered, and were decidedly hostile to those changes to which he had referred. There was one other topic which he wished, before he sat down, to touch, but touch lightly upon. It was with regard to the position and interests of the agricultural labourers of this county, in which he knew all who heard him took a deep interest. He considered, as they all knew, that it was much better for them as farmers to employ their labourers, so that they might gain an honest livelihood, even though the finding of such employment might press heavily at the time, than to withhold such employment, and thereby drive them to seek refuge in the poor-house. For let it not be forgotten that, although in the workhouse, they must still be supported by the farmer, and that, too, without deriving any advantage from their services; while they, at the same time, were deprived of the satisfaction of knowing that they earned the bread they ate. He entreated them to unite to the utmost of their power to preserve them from difficulty and distress; and, above all, as they valued the old English character, he besought them to protect the labourer from the refuge of the workhouse. Previously to this dinner, a meeting had been held in this parish, at the desire of the Duke of Buckingham, for the purpose of allotting the unemployed labourers among the ratepayers. His Grace stated, that if the rest of the ratepayers would take the men according to their assessment to the rates, he would choose eight labourers for his share for the winter, which is more than his proportion. The parishioners entered into an arrangement to take one labourer for each 70*l.* assessment to the poor-rates; those paying less than a 70*l.* assessment to take a labourer so many days a week in proportion.

Carnarvon.—The union of the two sees of St. Asaph and Bangor, which will take place unless that portion of the Act 6 and 7 Wm. IV., relating to the subject, is repealed, meets with great opposition in all parts of North Wales. A numerous meeting was held last week in this town, when petitions to Parliament were agreed to, in which, after pointing out the increased necessity for episcopal superintendence, the petitioners say—"The bishoprics of St. Asaph and Bangor have been, from very ancient times, endowed with funds solemnly dedicated to the maintenance of the Church in North Wales; and they cannot feel it consistent with the interests of religion or with the demands of justice, or even with the report of the Ecclesiastical Commissioners, to unite these sees, in order to divert a portion of these funds to the endowment of a bishopric in a district unconnected with Wales, and one of the wealthiest in the empire."

Deal.—In the accounts of her Majesty's visit to Walmer, it was stated that Prince Albert had made an excursion in the Fearless to the Safety Beacon on the Goodwin Sands, stated to be the invention of Capt. Bullock, R.N., commander of that vessel. Mr. Bush, the Engineer of the Caisson recently constructed at this place for the purposes of a lighthouse for the Goodwin Sands, subsequently addressed a letter to the *Times* newspaper, accusing Capt. Bullock of pirating his invention. This statement has now been met by a letter from Sir John Barrow, Secretary to the Admiralty, informing Capt. Bullock that he has laid the circumstance, at his request, before the Lords Commissioners, and is commanded by their Lordships to inform him that they are quite satisfied of the justice of Capt. Bullock's claim to the invention of the Safety Beacon, and of the merits of the structure.—The papers have this week given an account of a singular accident which happened to the Duke of Wellington shortly before her Majesty's visit. His Grace was eating a partridge at dinner, when one of the small bones of the wing stuck in his throat. The Duke, with his usual coolness, signified to his attendants that his medical advisers at Deal should be instantly sent for, and in a short time Dr. M'Arthur and Mr. W. Hulke, surgeon, arrived at the Castle. Every attempt to extract the bone by means of the forceps was unsuccessful, and as immediate relief was essential to prevent fatal consequences, the probang was used to force the bone into the stomach. The Duke is said to have suffered no inconvenience from the accident, although his throat was much lacerated by the operation.

Falmouth.—We before alluded to the unusual re-appearance of pilchards off the Cornish coast at this late season of the year. We find, by the *Falmouth Packet*, that 35 hogsheads of pilchards were taken at Fowey last week by a single sean, and that large quantities have been seen near the shore. All the seans belonging to Fowey are in pay, and should the weather continue fine there is reason to hope that a good season will yet be realised. Salmon are also plentiful. On Tuesday 100 fish were taken by the seans in this harbour, and sold at 3*d.* per lb.—A fatal accident occurred last week at the Carnbrea mines, in consequence of an accidental explosion of a cask of gunpowder in the large shed in which the men keep their clothes and tools. The explosion set fire to the shed, which contained upwards of 10 cwt. of gunpowder distributed in the different lockers of the workmen. One man was killed on the spot, and several others were severely injured. The flames spread rapidly, occasioning a constant succession of explosions, which were seen for many miles round. Several of the men, in endeavouring to escape, were seriously mutilated.

Glastonbury.—The Agricultural Society of this town held their meeting last week, the High Sheriff of Somerset in the chair. The principal topics of interest were the discussion of the recent changes in the Corn-law, and the alleged conversion of many gentlemen well known as supporters of agriculture. Mr. Miles, M.P., in reference to the statements of the daily papers that he had withdrawn his opposition to the Ministerial measures, complained of the misrepresentation of the *Times*. In the speech which had given rise to these comments, he merely gave his opinion as an agriculturist, and said that they must not look to high prices. From what he had seen and learnt, had he advised the farmers to look up for, or to expect high prices, he should have done what was contrary to his own convictions, and held out to them false anticipations. He was speaking upon a purely agricultural subject; and there were present gentlemen who were large corn-growers, and they knew that it was the practice, if higher prices were expected, to keep back corn and not bring it to market: and there were also present friends of his who were breeders and graziers. He advised them not to keep back their corn or stock with the view of obtaining high prices, but to take advantage of present prices, and be satisfied with wheat from 50s. to 60s. a quarter, and not refuse 6*d.* a pound for fat beef. His opinion on the tariff and corn-laws had been given in the House of Commons, and to these he adhered: his views were unaltered; and so long as the manufacturing and commercial interests are protected, so long should agriculture be protected, at least, if he stood alone, protection to agriculture should have his determined support. Mr. Dickinson, M.P., also explained some passages of his former speech, which had been misrepresented in the *Morning Post*. Upon the whole, he said, he did not think that restriction and artificial systems of Government were right: but, at the same time, if artificial systems existed, he thought it might not be well that relaxations should be made all at once rashly or hastily. His impression was, that the observations of himself and his colleague at Yeovil referred to the present state of things, and to their probable operation, without intimating that they were now prepared themselves to support further extensive changes; but he did say at Yeovil that the general course of things was against restriction, and he did not think those representing the agricultural interest could stop it. And he stated there that the agriculturists should rather endeavour to lend themselves to the state of things than to oppose them fruitlessly. He also advised them to unite together, and to adopt improvements for the increase of produce, in order to meet the altered circumstances of the times, as the best and safest course to be pursued.

Guernsey.—The Guernsey papers announce that Government has decided on the removal of the packet station of the Channel Islands from Weymouth to Southampton. The inconvenient distance of Weymouth from London had been long felt, and for some time past all the correspondence from these islands to England had been sent by the Southampton steamers, by which means letters have reached London and the North of England a day earlier than when sent by Weymouth. The Post-office expenses will be reduced, it is said, more than 20,000*l.* per annum by the change, and the Southampton steamers will be materially benefited by being made mail-packets.

Liverpool.—Our readers will remember that the inquest on the seaman killed by the collision between the two steamers on the Mersey, noticed in our last, was adjourned to Monday, in order to allow the coroner to communicate with Sir James Graham on the subject of his jurisdiction, as there was some doubt whether the collision took place nearer to the Cheshire than the Lancashire shore. In answer to this inquiry, Sir J. Graham has communicated the opinion of the law officers of the Crown, that the coroner of Liverpool has no jurisdiction to hold the inquest in question, and that the coroner of Cheshire is the proper officer to hold an inquest, assuming the place where the accident happened to be within that county. The body of the seaman, which is still unburied, has accordingly been sent into Cheshire to have the inquest completed. The inquest took place on Tuesday, before the coroner of that county, when the jury returned a verdict of Accidentally killed.—We learn by the *Liverpool Albion*, that although it is usual during the latter part of the year for numbers of persons to return in the steerages of ships from New York, this year the number has been much greater than usual. The majority are people who emigrated early in the year, and who, disappointed on their arrival in the United States at not getting employment, have returned, many of them in a state of utter destitution. The Liberty, which arrived in the early part of last week, brought 120 in the steerage; and the Hottinguer, which arrived on Friday, brought 200. From the scarcity of employment in the cities on the seaboard, it is expected that hundreds of disappointed emigrants will yet return.—The contract steamer with the early Dublin mail lost her way in the fog of Saturday, and got on shore on the Welsh coast, near Rhyl. The passengers and mails were brought to Liverpool in another steamer, which arrived in the afternoon.—Miss Jane Farrer, the lady who had been indicted for purloining articles from a shop in this town, as mentioned in our Paper of the 26th ult., was tried on Wednesday, and acquitted.

Manchester.—A meeting of the Anti-corn-law League took place in this town on Friday, to receive a report of the progress of the fund. The report contained a long list of places in various parts of the manufacturing districts in Scotland, in the western and southern counties of England, and in Guernsey, from which applications for subscription cards had been received. In Birmingham a committee had been formed to assist in raising the fund, including nine aldermen (five of whom were magistrates), and twenty-nine members of the town council. From Stockport sheets had been returned containing 308 names, making 2,371 names registered there; and 4*l.* 0*s.* 4½*d.* had been received from that town for registration fees, making altogether 32*l.* 9*s.*, the greater part of which sum had been contributed in pennies. With regard to their correspondence, the report stated that, since that day last week, the council had paid for postage stamps and envelopes 22*l.* 10*s.* The chairman said it was now about six weeks since the council of the League first introduced to the public the plan which now occupied so large a share of public attention. During that period a greater number of meetings had been held in connexion with this movement, probably, than had ever been held in the same space of time on any former occasion in connexion with any public question. Meetings were being held from day to day, at which members of the council were generally present announcing and explaining their plans, and directing the attention of the public to the future.

Nottingham.—On Tuesday, a meeting was held in this town, for the purpose of holding a conference with a deputation of the Anti-corn-law League. Resolutions were passed, attributing the prevailing distress in the midland counties to the corn and provision laws, and pledging the meeting to support the League. In the evening there was a tea-party, at which Mr. Paget presided: it was attended by about 600 persons, and was addressed by Mr. Cobden and other gentlemen. The sum subscribed at both meetings amounted to 1.330*l*.

Plymouth.—Her Majesty's steamer Locust, Lieut. Lunn, arrived on Friday morning from the Mediterranean, bringing as passengers Major Malcolm, in charge of the Chinese treaty for her Majesty's signature, and Capt. Richards, with despatches for the Admiralty. Orders had been previously received from Government to expedite her *pratique*, and the officers immediately released her from quarantine. A carriage was in waiting to convey them to town, where they arrived on Saturday.

Portsmouth.—The Cambridge, 78, Capt. Barnard, arrived at Spithead on Saturday evening, from the Mediterranean, having on board upwards of 80 cases of ancient marbles from the ruins of Xanthus, stated in the papers to weigh 180 tons, which are to be forwarded to the British Museum.—The Archduke Frederick of Austria arrived here on Tuesday, from Windsor; his imperial highness will shortly return to the Continent, in his frigate the Bellona, now lying in the harbour ready for sea.

Rochdale.—On Wednesday the 7th inst. a meeting in favour of the Anti-corn-law League took place in the theatre of this town, which was crowded in every part. Mr. Fenton, late M. P. for the borough, presided. Mr. Buckingham opened the proceedings by delivering a lecture on the principles of free trade; after which the meeting was addressed by Mr. Cobden, Dr. Bowring, and Mr. Bright. A subscription in favour of the League was commenced, and before the meeting broke up the sums announced amounted to 1320*l*. 6*s*. 6*d*. If to this be added the 375*l*. contributed by five manufacturers of this town at the meeting at Manchester on the 22d ult., the amount already subscribed by Rochdale will be nearly 1700*l*.

Steyning.—Another important agricultural meeting took place in this town on Monday. After the show of stock, about 120 noblemen and gentlemen dined together. The Duke of Norfolk presided, supported by the Earl of Arundel and Surrey; Lord Edward Howard; Mr. C. Goring, M.P. for Shoreham; Mr. J. A. Smith, M.P. for Chichester; Mr. H. D. Goring; Major Sandham; &c. The Duke of Norfolk alluded to the excellence of the show, and said that while such stock could be exhibited after all the disadvantages of a burning summer, farmers need not be alarmed at any cattle that could be brought into the country, particularly at the present moment, when the number of foreign beasts in the London market, compared with the whole supply, was but as a drop of water in the sea. Foreign cattle had to be bred and fed before they could be sent to England, and therefore the farmer might well laugh at the efforts of the foreigner at competition, at least for many years to come. Mr. C. Goring, in returning thanks, as one of the Members for the Rape of Bramber, said, that professing himself as he did a friend to agriculture, he feared that he might at first sight be accused of inconsistency in supporting those measures which had lately passed. They had certainly, in some measure, and in some people's opinion altogether, led to the present price of stock; but he wished to remind them that for the benefit of the producer it was necessary that the health of the consumer should be strong. Considering the present state of trade, the high price of stock, a gradual increase of that price with an increasing population, it was highly necessary that some measures should pass to relieve the country; and although in this, as in all other great changes, individual interests must suffer a temporary loss, he hoped that in this case the measures of the Government had passed without material injury to the farmer, who would find, in the gradual improvement which was even now taking place, and in the steadiness and regularity of the market, a compensation for the loss which he sustained. The next speaker, the vice-chairman, Mr. H. Goring, said:—"As a landlord he felt it right to address them, and from the position which he held, he could tell them all, as farmers, that they must no longer depend upon legislative protection. Let them all, as landlords and farmers, stand shoulder to shoulder, and manfully meet the crisis before them. He would tell them that, no matter when, come it would, and come it must, corn would be admitted free, and on legislative protection they could not depend. If their landlords met them, if they themselves stood firm in their own position, if they would cultivate their land and exert themselves, he could assure them, from what he knew himself, there was no land upon the Continent, no farmer upon the Continent, no capital upon the Continent, that ever could compete with them." Mr. J. Abel Smith, referring to the tone of the speakers at this and other recent meetings, observed, that "Mr. Goring, and others that expressed the same opinion, were acting the kinder and truest part towards the farmers of England, when they encouraged them rather to rely on themselves than on any legislative protection. He was sure that Mr. Goring spoke the words of truth and wisdom when he told them that, as in every other profession in life, whether it be the manufacturing or whether it be the agricultural, capital, intelligence, and industry carried the day. It was to these three great elements of success that this country owed its pre-eminence, and it was to these three elements that the English farmer would owe his success, if success was hereafter to attend his exertions. Monopoly was an unsound principle. When they relied upon their own intelligence, skill, and industry, they relied upon something unchanging and certain; but when they relied upon legislative protection, they relied upon what they had found to be dependent on party politics and party feeling—utterly unsound, utterly unworthy to be trusted to as a basis of a country's prosperity and happiness. He believed that in the agriculture of this country lay one of the great elements of its wealth and power. Long might they claim as great a pre-eminence of the skill and energy of their farmers as they had in the enterprise and success of their merchants."

Wakefield.—The Yorkshire papers announce with regret the failure of the extensive firm of Messrs. Fernandes & Sons, of this town. The firm was extensively known as millers, coal-owners, manufacturers, and corn-merchants. It is said that a law-suit, instituted against Mr. Fernandes and others, by Mr. Hemingway, of Oulton, and which was last week decided against them, and the recent depreciation in the price of grain, have been the causes of the failure. At the corn-market at Wakefield on Saturday, the stoppage was the subject of general conversation, and great alarm prevailed among the agriculturists. It is said that the liabilities of the firm are not less than 90,000*l*.

Worksop.—On Friday a large meeting of the principal inhabitants and farmers of this neighbourhood was held, for the purpose of considering the best means for employing the able-bodied men who are out of work, during the ensuing winter. It was announced to the meeting that the Duke of Portland had offered to subscribe the sum of 100*l*. for that purpose, on condition that a preference be given to labourers of a sober and industrious character. The Duke of Newcastle and Mr. Savile Foljambe have also signified their intention of subscribing liberal sums for the purpose. A committee was appointed to carry the objects of the meeting into effect, to receive applications from labourers for work, and to ascertain the number of able-bodied men in want of employment.—The local papers also mention that in the course of last week an application was made by a tenant to the Duke of Portland, to ascertain if he would sanction a reduction in the wages of farm labourers, from 12*s*. to 10*s*. per week. His Grace's reply was, "that if his tenants could not afford to pay their labourers at the rate of 2*s*. per day, they were quite at liberty to give up their farms, and he would occupy the land himself."

Railways.—The following are the receipts of the principal Railways for the past week:—Great Western, 10,278*l*.; Liverpool and Manchester, 3,850*l*.; Sheffield and Manchester, 198*l*.; Great North of England, 1,153*l*.; Greenwich, 711*l*.; Glasgow, Paisley, Kilmarnock, and Ayrshire, 822*l*.; Blackwall, 506*l*.; Hull and Selby, 954*l*.; South-Western, 4,546*l*.; Edinburgh and Glasgow, 1,573*l*.; Birmingham, 12,503*l*.; Midland Counties, 2,102*l*.; Eastern Counties, 810*l*.; Croydon, 198*l*.; Birmingham and Derby, 1,170*l*.; Birmingham and Gloucester, 1,505*l*.; Northern and Eastern, 1,001*l*.; North Midland, 5,391*l*.; Brighton, 2,644.—On Saturday the eleven-o'clock train from Nine-Elms, on the South-Western Railway, was obliged to return to the station from Wandsworth, in consequence of an accident unattended by any untoward consequences. As the train was proceeding at a rapid rate, one of the axles of the engine suddenly broke. The engine being, as those on this line are, a six-wheel engine, did not turn over, but was able to propel the train to Nine-Elms, where another was substituted.—An inquest has been held at Northchurch on the body of Mrs. Bye, who was killed by the late accident on the London and Birmingham Railway. After a long inquiry the jury returned a verdict of Accidental Death, with a deodand of 5*s*. on the engine. They accompanied their verdict by a strong recommendation to the directors, that they would for the future place a luggage van, or an empty carriage, to work between the engine and the passenger carriage, being convinced, in the present instance, that if such a plan had been adopted, no death would have ensued. Mr. Creed, the secretary, assured the jury that it was the intention of the company to adopt their suggestion, if it were only for the purpose of satisfying the public mind. In the course of the inquest, several incidental circumstances connected with the management of railways were discussed: their first inquiry was directed to the question, whether the arrangements of the company for examining and testing the security of their engines were such as to give a sufficient guarantee to the public that care and caution are exercised to preserve the safety of passengers. Their opinion on this point is probably expressed by the merely nominal deodand imposed; and some stress was laid on the fact that this is the first occasion on which any passenger has lost his life on the railway since the period of its opening. The next question was that connected with four-wheeled and six-wheeled engines. The engine to which the accident occurred was a four-wheeled one, and some of the witnesses stated that a six-wheeled engine would not have been safer, as the fore-wheels are the guiding wheels, and the breaking of the fore-axle necessarily deprives the engineer of all government over the engine. This did not, however, appear to be clear from the evidence of others. In a previous instance, detailed by the witnesses, it appeared that though an axle-tree was completely severed within the "journal," the engine was carried in safety to Wolverton, a distance of many miles. In the present instance the axle was severed so close to the wheel that the wheel flew off. It would seem, therefore, that it was rather the loss of the wheel, caused by the axle breaking, than the mere rupture of the axle-tree, which was the immediate cause of the accident. The last and most material point of inquiry was in regard to the means of detecting an internal defect in the axle or in other parts of the machinery. Evidence was given by Mr. Parker and Mr. Bury on this head. They differed somewhat in opinion on one point, the former considering the defect in the axle to have lately happened, and the latter believing it to have been an original defect in the workmanship, increased by wear and tear. Mr. Parker describes the mode of testing the axles pursued by the company at their periodical examinations, as sure to detect any external flaw, or any defect which had extended from the interior to the surface of the axle-tree; but contended that it was impossible to detect any internal defect. In reference to the parties injured by the accident, we learn by the daily papers that the deceased was, before marriage, Mary Gray, who succeeded her sister and became the second nurse of Lord Byron, "gaining," says Mr. Moore, "an influence over his mind against which he very rarely rebelled." The engine-driver, Charles Callom, received a high character from the different witnesses. He was rewarded by the company some time since by a medal for his good conduct, and he drove the engine that conveyed Marshal Soult to Liverpool in so short a space of time. The Marshal was much pleased with his skill and intelligence, and made him a present of 10*l*.—The Yorkshire papers mention as a proof of the effect of wind upon railways, that one of the cattle waggons at the Northallerton station of the Great North of England Railway was shifted a few days ago, by some mischievous person, from the side rails to the main way, and the wind blowing violently from the north, it was forced forward in a southerly direction at the rate of 12 or 14 miles an hour, and was not stopped until it reached the Alne station, a distance of 20 miles from its starting point.—We understand a new railway is in contemplation from Pimlico to Datchet, so as to enable her Majesty to reach Windsor without the inconvenience of going in the first instance to Paddington. The line is to be through the Fulham-fields and the back of Hammersmith as nearly straight as may be practicable.

IRELAND.

Dublin.—The Court of Delegates have delivered judgment in the long-litigated case of the appeal of the Rev. Dr. Wilson against the election of the Rev. Robert Daly, as Dean of St. Patrick's. As we have already mentioned, the point at issue was the validity of the votes of the Archbishop of Dublin and the Rev. Dr. Todd, which had been tendered for Dr. Wilson, and rejected. The Judge of the Prerogative Court, Dr. Radcliffe, decided against both votes, and hence the appeal to the delegates, who were unanimous in favour of the vote of the Archbishop, but differed, four to one, in regard to the vote of Dr. Todd. Mr. Justice Crampton on Saturday, before pronouncing judgment, mentioned that he had received an anonymous letter on the subject of the case—designed to influence his judgment—and said that the writer was guilty of a contempt of the court as well as a gross breach of decorum. He then proceeded to say that, after hearing the case for eleven days, they had now arrived at the last stage of this protracted proceeding. The advocates of the Rev. Mr. Wilson had not contended that their client should be elected, or substituted for Mr. Daly, but that it was a void election, and that a new election should be ordered by the court. It was admitted on all hands that *primâ facie* the election of Mr. Daly was valid, and the opposer of the election was bound to show cause why it should be annulled, and the burden of proof rested on the opposer. His Lordship then referred at length to the points in controversy in the case, and having again intimated that he agreed in opinion with Baron Richards and Masters Henn and Townsend, he concluded by announcing the formal decision of the court, confirming the judgment of the court below and the election of Mr. Daly. The only judge in favour of Dr. Todd's vote, the admission of which would have sent the parties to a new election, was Mr. Justice Perrin. Mr. Daly has since been installed in the deanery, but it is rumoured that he will soon vacate it, by promotion to the vacant see of Cashel. — The Lord Lieutenant took the chair last week, for the first time, as President of the Royal Dublin Society, on the occasion of awarding premiums to the successful pupils in the drawing and modelling schools at the annual competition. Among the visitors on this occasion were, the Archbishop, the Lord Chancellor, the Lord Mayor, Lord Elliot, the Commandant of the Garrison, several judges, and members of both Houses of Parliament. His Excellency distributed the prizes, and said that he did not pretend to lay claim to any distinction in the fine arts, or to lay claim to an extensive cultivation of them; but he had always admired and cultivated them to some extent. It so happened that the principal branch which came under their notice that evening was one to which he was most particularly attached. It was one in which he had got premiums himself in London from the Society of Arts, many years ago. He had received two medals, one silver, the other gold, for drawings. When he now looked at them, he thought they were very little worthy of the credit he then got for them. Little at that time did he think that he should have the pleasure of distributing premiums himself afterwards on a similar occasion. He should repeat that duty and inclination most cordially went together when he presided there that evening. Although he did not pretend to be perfectly skilled in the arts, he was an amateur, he acknowledged. He endeavoured to study them, because he felt that a knowledge of drawing was mixed up with every pursuit one could follow in life. He had been engaged for some years in England in building; he might say, therefore, that he had taken an interest in the science, and indeed he would recommend any young man going forward in life to learn the arts, and all parents to cultivate in their children the arts of drawing and designing, because, independent of their own advantages, there was not one position in life in which a man could be placed that a knowledge of those arts might not be of service. His Excellency referred to the resolution of Parliament to erect three monuments to Lords Exmouth, De Saumarez, and Sir Sidney Smith; he stated that they were to be executed by artists residing in the three principal cities, London, Dublin, and Edinburgh; and he was happy to announce that one of the gentlemen selected for the purpose was Mr. Kirk, of Dublin, who had been a pupil of these schools.

Mayo.—The Earl of Lucan and Mr. St. Clare O'Malley have both been removed by Government from the commission of the peace for this county, in consequence of a violent personal altercation which took place between them at the petty sessions of Castlebar five or six weeks since.

Tipperary.—The magistrates of the South Riding of this county have addressed a memorial to the Lord Lieutenant in reference to the late murder of Mr. Scully. The principal topic adverted to is the defective state of the law for the registration of fire-arms. The magistrates declare their belief, that the law at present in force is totally inefficient for the protection of life and property, and they express their hope that Government will adopt such measures as will have the effect of withdrawing fire-arms from persons not duly qualified, and render the penalties for their illegal possession more stringent.

SCOTLAND.

Edinburgh.—The late Convocation of Non-intrusion Ministers have forwarded a memorial for the consideration of Sir Robert Peel and the other members of Government. The document is of considerable length, and is signed by Dr. Chalmers as Chairman. The memorialists state, that their determination to quit the church if they do not obtain the concessions they demand, is not the result of disappointment or irritation, or any want of a due regard to the important benefits which the present establishment of the Church confers upon the people of Scotland. On the contrary, they declare that they entertain so strong a sense of the value of the establishment, and of the many evils likely to result from its overthrow, that there is no compromise to which they would not consent—no sacrifice of feeling, or even of consistency, to which they would not submit, if by any means they might avert a calamity, the idea of which they have all along been reluctant to entertain. It is plain, they say, that if no legislative relief be conceded, and if the Church proceed, according to her own views of duty, against those who transgress her rules, she has no alternative but to deal forth the censures of ecclesiastical power in a manner that must provoke retaliation, and must necessarily lead to inextricable confusion and disorder. The memorialists confess that they shrink from such an exhibition as would thus be presented before the people of Scotland; and that this is one practical consideration, among others, which has weighed much in determining them to bring this whole question to a final issue, and to retire from their position, as connected with the establishment, rather than prolong an unseemly contest with the civil courts, which deny, and with their own brethren, who set at nought, their jurisdiction—a contest which could not fail to be attended with disastrous consequences, affecting both the majesty of law and the higher interests of religion. The memorialists submit the whole subject to the Government, and conclude by declaring that they "deeply feel the solemnity of the question now submitted to the decision of Parliament and of the nation; it being, in the opinion of the memorialists, nothing less than the question whether the Church unalterably established in Scotland is to be preserved inviolate, according to the faith of treaties, or whether this great kingdom is to commit, as the memorialists would regard it, the heinous national offence of not only breaking the national faith, but of disowning the authority of Christ in his own house, and refusing to recognise his Church as a free spiritual society, instituted by him, and governed by his laws alone."—Sir Robert Peel has addressed a letter to the Lord Provost, announcing that the Government are co-operating with him in adopting measures without delay, which, while they contribute to the embellishment of Edinburgh and its environs, may also provide some additional means of occupation for the unemployed in this city during the winter.

Greenock.—A memorial has been forwarded to Sir R. Peel by the unemployed in this town in reference to the state of the Scotch Poor-Law, and other matters of local interest. In acknowledging this memorial, Sir R. Peel writes to Mr. Wallace, M.P., by whom it was transmitted, "That the state of the law in Scotland, in respect to the relief of the destitute, has attracted the serious attention of her Majesty's Government, and that measures are now in progress for instituting a full and comprehensive inquiry into that important subject, with a view to the amendment of the existing law."

Paisley.—The number of the unemployed in this town is now upwards of 10,000, and is still on the increase. The scanty pittance allowed them has latterly been reduced one-half, owing to the weekly remittances from London having become less: and the committee are unwilling to guarantee a further allowance. The local papers state that all the towns and villages in this district of Scotland are likewise suffering severely.

THEATRICALS.

DRURY-LANE.—On Saturday night Mr. Westland Marston's tragedy of "The Patrician's Daughter" was produced with decided success. The great interest of this play was the bold experiment of laying the scene of a poetical tragedy in our own times. The passions, characters, interests, and costumes of the play were completely those of the every-day life in which we move, and the success of the attempt completely settled the question whether any tragedy would be received that did not appeal to the audience by associations and costumes belonging to a period far removed from the present time. The plot of "The Patrician's Daughter" is simple, and is intended to show pride of birth and pride of talent in contra-position. *Lord Lynterne* (Mr. Phelps), his daughter *Mabel* (Miss H. Faucitt), and his sister *Lady Lydia* (Mrs. Warner), are the proud on account of birth: *Mordaunt* (Mr. Macready), a poet of humble origin, and the political foe of *Lord Lynterne* in the House of Commons, is the proud on account of genius. An attachment is growing between him and *Lady Mabel*, who is a great admirer of his poetry, but is unconscious of her love. The aunt (*Lydia*), by a system of falsehood, sows seeds of mischief in the hearts both of her niece and *Mordaunt*; and when the latter asks the hand of the former from her father, he is repulsed not only by the Earl, but by *Mabel* also. He is overwhelmed with scorn and disappointment, and determines to be revenged. Five years elapse, and *Mordaunt* becomes an acceptable match for *Mabel* by raising himself to a high degree of political importance. The Earl now consents to the formal proposition for an alliance. Every preparation is made for the wedding; the guests arrive; and *Mordaunt* revenges himself by rejecting the hand of *Mabel* in the presence of all the company. The consequence is, that *Mabel* falls into a decline; her father, to save her life, so far foregoes his pride as to call on *Mordaunt* and seek a reconciliation; and *Lady Lydia*, conscience-stricken by her niece's sufferings and, being herself on the verge of the grave, confesses the double deception she had practised. *Mabel*, conceiving her father's appeal to *Mordaunt* a degradation, hurries after him, becomes reconciled to her lover, and falls a corpse at his feet. *Mordaunt* and the Earl become friends over the dead body of *Mabel*. The action throughout was effective, and, with the exception of a little heaviness at the commencement, the interest of the audience was well kept up. At the close of the play, the principal performers and the author were called for and received with louder acclamations of applause than have been heard in the theatre for some time past. The play was announced for repetition four times a week.

Law.

JUDICIAL COMMITTEE OF THE PRIVY COUNCIL.—*Read* v. *Sanders.*—Lord Campbell gave judgment in this case, of which we gave the pleadings in our Paper of the 3d. He said this is an appeal from an order, or decree, made by the Dean of Arches, in a cause promoted under the act of the 3d and 4th of her present Majesty, in virtue of letters of request, under the hand and seal of the Bishop of Exeter, by Ralph Sanders, against the Rev. Henry Erskine Head, rector of Feniton, in the county of Devon and Diocese of Exeter, to answer certain articles exhibited against him, having, within the said diocese, written and published in a newspaper, called the *Western Times*, a letter, dated Aug. 21, 1841, entitled "A View of the Duplicity of the present System of Episcopal Ministration, occasioned by the Bishop of Exeter's Circular on Confirmation," affirming and maintaining that "The Catechism," "The Order of Baptism," and "The Order of Confirmation," in the Book of Common Prayer, contain erroneous and strange doctrine, and wherein are also openly affirmed and maintained other positions in derogation and depraving of the said Book of Common Prayer, contrary to the statutes, and to the constitutions and canons ecclesiastical of the realm, and against the peace and unity of the church. The defendant being cited in the Arches Court, appeared under protest, and insisted that the letters of request were not in pursuance of the Church Discipline Act, and, therefore, the Dean of Arches had no jurisdiction to entertain the suit. The judge, however, overruled the protest, and assigned the defendant to appear absolutely. The first objection is, that the letters of request are, *ex facie*, defective and void, on the ground that they do not show under whose application the suit commenced. Their Lordships are of opinion that they are sufficient: the statute does not require that there should be any given form, and they clearly disclose that the cause was instituted at the voluntary motion of Ralph Sanders. The bishop having authority to issue letters of request, if he thinks fit, there can be no necessity for stating, according to the old form, at whose request they are granted. For reasons hereafter to be given, we think they need not make any reference to the notice which had been before served by the Bishop. The second objection, and one of a graver character, is that the Bishop had no authority to issue them, as he had made an election to proceed by a commission of inquiry in his own diocese. The third section of the Act provides, "That in every case of any clerk in holy orders of the United Church of England and Ireland who may be charged with any offence against the laws ecclesiastical, or concerning whom there may exist scandal or evil report, as having offended against the said laws, it shall be lawful for the Bishop of the diocese within which the offence is alleged or reported to have been committed, on the application of any party complaining thereof, or, if he shall think, of his own mere motion, to issue a commission under his hand and seal to five persons, of whom one shall be his vicar-general, or an archdeacon, or rural dean within the diocese, for the purpose of making inquiry as to the grounds of such charge or report; provided always that notice of the intention to issue such a commission under the hand of the Bishop, containing an intimation of the nature of the offence, together with the names, addition, and residence of the party on whose application or motion such commission shall be about to issue, shall be sent by the Bishop to the party accused, 14 days at least before such commission shall issue." On the 11th of October, 1841, the defendant was, in due manner, served with a notice under the hand and seal of the Bishop of Exeter, dated on the same day, which, after reciting the letter referred to in the letters of request, and that there was a scandal and evil report against the said Rev. Henry Erskine Head, that he was the author and publisher of the said letter, proceeded in these words:—"And whereas we, Henry, by divine permission Bishop of Exeter, rightly and duly proceeding under the authority, and in conformity with the provisions of a certain Act of Parliament, to wit, the 3d and 4th Victoria, chap. 86, intituled, 'An Act for better enforcing Church Discipline,' of our own mere motion think fit, and intend to issue a commission, under our hand and seal, to five persons, of whom one shall be our vicar-general, or an archdeacon, or rural dean, within our diocese, for the purpose of making inquiry as to the grounds of such report, in order to the institution, if need be, of such further proceedings, in pursuance of the said last-mentioned Act of Parliament, as the case may require. We do, therefore, by these presents under our hand, give notice of such our intention to you, the said Rev. Henry Erskine Head, and we do hereby intimate to you, that such our commission as aforesaid, for the purpose aforesaid, will issue accordingly at or after the expiration of 14 days from the day of your being served with these presents. Given under our hand this 11th day of Oct., A.D. 1841.—HENRY EXETER." On the 9th of November following, without anything being done to countermand this notice, letters of request were issued, by which the defendant, without any commission of inquiry, was to be prosecuted in the Arches Court. It is contended that this was contrary to the 13th section of the statute, which enacts, "That it shall be lawful for the Bishop of any diocese within which any such clerk shall hold any preferment, or if he hold no preferment, then for the Bishop of the diocese within which the offence is alleged to have been committed, if he shall think fit, either in the first instance or after the commissioners shall have reported that there is sufficient *primâ facie* ground for instituting proceedings, and before the filing of the articles, but not afterwards, to send the case by letters of request to the Court of Appeal of the province, to be there heard and determined according to the law and practice of such court." It is contended that, by reason of the notice, letters of request were not sent in the first instance within the meaning of the statute; and if that were so, they would certainly fail, as their validity rests entirely on the statute. But, after much doubt and hesitation, their Lordships have arrived at the conclusion that the notice may be entirely disregarded, and that within the meaning of the statute the letters of request were sent "in the first instance." That notice only intimates an intention to institute a proceeding, and that cannot be considered the commencement of a suit. When the letters of request issued, there was no inquiry pending, and the letters of request may issue "in the first instance," or after the report of the commissioners that there is a *primâ facie* case. Although the notice was served, there were no means of compelling the Bishop to issue a commission; and it seems to have been admitted that if, on further consideration, his Lordship thought it more expedient to send the case at once to the Arches Court, he might have done so by superseding the notice. It has been argued that this construction of the Act would subject clergymen to vexatious proceedings, both before their diocesan and in other courts; but we cannot suppose that a change of intention as to the mode of proceeding ever takes place except for the interests of justice, and the good of the church. And it is difficult to conceive how a party can be prejudiced by the mere serving of a notice of an intention to issue a commission. If such commission had issued, and the party were cited to appear under it, then their Lordships would have thought that the letters of request should not issue. The decree, therefore, will be affirmed, but without costs. There was a further prayer that the case should be retained before the Privy Council; their Lordships, however, are of opinion, that it ought to be remitted to the Arches Court. This is a court of appeal of final resort, and their Lordships think that the parties ought to have the benefit of the decision of a court below, as from the judgment of this court there is no appeal.

CENTRAL CRIMINAL COURT.—*[illegible]*, aged thirty-three, was indicted for a misdemeanour, in obtaining money under false pretences. The circumstances were rather lengthy in detail. The prisoner had duped a young Scotchman, by promising that he could get him a situation at Port Philip. The prisoner told him that Lord Stanley had given him the appointment of emigration agent at Port Philip, and not merely promised he should have the appointment. Lord Stanley deposed that as Secretary of State for the Colonial Department, he never gave the prisoner any appointment as an emigration agent at Port Philip, or elsewhere. An application was made to him on the prisoner's behalf, and he gave him a letter of introduction to the Governor of Port Philip, in which he stated that the prisoner had been recommended to him by Sir G. Clerk. It was a lithographed form of introduction, which could be obtained by any person about to emigrate, on being properly introduced at the Colonial Office. A number of highly-respectable witnesses were then called, and they gave the prisoner a very high character for integrity and honourable conduct for a great number of years. The Recorder summed up, and the jury, after a short deliberation, returned a verdict of Guilty, but at the same time recommended the prisoner strongly to the mercy of the court.

Peter Hughes was indicted for obtaining money from various persons, on the pretence that he was duly authorised to collect the same by the Rev. E. Cavanagh, of Wexford, towards the expenses of a Catholic chapel, then erecting near that city. The Rev. Mr. Cavanagh declared that the prisoner never received any authority from him to do and receive for the purpose specified. The prisoner had collected 100*l* The jury having found him Guilty, he was sentenced to seven years' transportation.

Captain Henry Belstead, described in the calendar as a soldier, was charged with feloniously forging on the 4th of October, at Richmond, a certain acquittance and receipt for the sum of 20*l*., with intent to defraud Sir Charles Price, and others, trustees of the Richmond Savings Bank. There were several other counts, charging him with forging and embezzling various sums belonging to other parties. The prisoner pleaded Not Guilty, but afterwards retracted, and pleaded Guilty. The circumstances of this case were noticed under our metropolitan news on the 26th ult. Our readers will recollect that Captain Belstead was secretary of the Richmond Savings Bank, and in his official capacity had committed the offences with which he was charged. The prosecutors recommended him to mercy, and several officers attended to speak to the previous excellence of his character.—The Recorder, addressing the prisoner, said, "It is most painful for the Court to be called upon to pass any sentence upon a person in your situation—much more so, that sentence which is imposed by statute for the offence to which you have pleaded guilty; but I must inform you, that although the offence subjects you to transportation, or a certain period of imprisonment, and that for not less than two years, the only discretion left with the Court is, with respect to hard labour. It will be my duty, therefore, to pass upon you a sentence of two years' imprisonment; but, although the hands of the Court are, to a certain extent, tied, still an application may be forwarded on your behalf to the Secretary of State, and I hope that the circumstance of your having fought many years in your country's cause, and down to the period of these transactions maintained an excellent character, will have their full weight. It is the attribute of the Sovereign alone to grant mercy under such circumstances, and I have no hesitation in saying, that in any application which may be made on your behalf, the Court will willingly acquiesce. It remains only for me to pass upon you the sentence of the Court, which is, that you be imprisoned in the House of Correction for two years, but without hard labour."

John Bowman Reynolds, and four other seamen, were charged with killing Philip Keel, on the high seas, within the jurisdiction of the Admiralty of England. This case arose out of the circumstances which occurred on board the [illegible], East Indiaman, noticed under our Liverpool news last week. Mr. Baron Alderson considered that there was no evidence to go to the jury in this case. The conduct of the prisoners was such as should cause them deep regret for the remainder of their lives; but as regarded the charge now preferred against them, the evidence failed altogether. The jury, under his lordship's direction, then acquitted the prisoners. The judge then said that it was most important that the indictments should be properly prepared, and only such allegations made, and charges brought, as could be fully sustained and borne out by the evidence. It was very wrong that persons should be indicted for acts of which there was no evidence whatsoever, as the mate in this case, against whom there was no proof of his having ordered the man to be boused out, as was alleged in the indictment. At the same time it was a great evil that persons should altogether escape punishment on a mere point of form, in consequence of wrong charges being made against them.

Henry Stanhope [illegible], alias *Staunton*, described in the calendar as a labourer, was indicted for stealing two watches, value 35*l*., the property of John Menzies, in his dwelling-house. The circumstances of this case disclosed a long career of crime, for which the prisoner had been once sentenced to transportation, but was pardoned, on the ground that he had given important information to Government during the riots in Ireland. The Judge said he should now inflict the severest penalty allowed by law, and sentenced him to transportation for life.

TATTERSALL'S, THURSDAY.—The following were all the bets laid:

750 to 25 agst. [illegible].
1000 — 25 — [illegible]
1000 — 40 and 500 to 10 agst. Sirikol.
1000 — 15 three times, 1000 to 20 twice, and 2500 to 50, agst. [illegible] Valentine.
800 — 20 agst. Amorino.
1000 — 25 agst. the [illegible] colt.
1000 — 25 — the [illegible] colt.
1000 — 30 twice agst. the [illegible] colt.
1000 — [illegible] and Long Pipe.
2000 — 20 — Cheviot.

The same odds were afterwards offered against all the horses mentioned, except Amorino and Sirikol.

MARK LANE, Friday, Dec. 16.—The fresh supply of English Wheat since Monday has been to a moderate extent; prices were fully equal to our quotations of that day. The sale of Foreign has been quite in retail, but at the same rates, the holders not being disposed to give way. No demand for exportation. The arrival of Barley has been large, and some quantity left unsold of distilling and grinding qualities. In Peas and Beans there is no alteration. There is very little doing in the Oat Trade, and the same prices are demanded.

SCOTCH SEQUESTRATION.—R. Rentoul, Newport, potato-merchant.

BIRTHS—On the 10th inst., in Chesham-place, Lady John Russell, of a son—On the 9th inst., in Hertford-street, May-fair, Lady Clay, of a son—On the 6th inst., at Dalmahoy, the Countess of Morton, of a daughter—On the 9th inst., at Voelas, Denbighshire, the lady of Charles Wynne, jun., Esq., of a son—On the 11th inst., at Lauderdale-house, Highgate, the lady of Richard Bethell, Esq., Q.C., of a son.

MARRIED—At All Souls' Church, Sir Charles des Vœux, Bart., to Lady Cecelia Paulet, daughter to the Marquess of Winchester—On the 15th inst., at Trinity Church, Upper Chelsea, the Hon. Spencer Dudley Montagu, to Anna Louisa, widow of the late Joseph Jekyll, of Wargrave Hill, Berks.

DEATHS—On the 14th, in the Queen's Prison, suddenly, Mrs Maria Cooke, aged 61, formerly a fruiterer in Central Row, Covent-garden Market—On the 10th inst., at his seat, Hardwick Grange, Shropshire, General the Right Hon. Viscount Hill, G.C.B., G.C.H., in his 71st year—On the 10th inst., at Three-Mile Cross, near Reading, George Mitford Esq., aged 82, father of Miss Mitford, the well-known author of "Our Village."

A NEW WORK ON GARDENING.

THE FIRST NUMBER of THE GARDENER and PRACTICAL FLORIST for the new year will be ready January 7th, illustrated with Wood Engravings, and containing 24 columns of valuable practical information on Gardening and Flowers. Published every Saturday, Price *3d.*

London: R. Groombridge, 5, Paternoster-row, and sold by all Booksellers and Newsmen.

Loudon's "Arboretum et Fruticetum Britannicum," Abridged for Gardeners, Planters, and Nurserymen.

AN ENCYCLOPÆDIA OF TREES AND SHRUBS; being the "Arboretum et Fruticetum Britannicum" abridged; containing the Hardy Trees and Shrubs of Great Britain, Native and Foreign, scientifically and popularly described: with their Propagation, Culture, and Uses in the Arts; and with engraved Figures of nearly all the Species. Adapted for the use of Nurserymen, Gardeners, and Foresters. By J. C. Loudon, F.L.S., &c. 1 Thick vol. 8vo (1842), pp. 1234, with upwards of 2,000 Engravings on Wood, 2*l.* 10*s.* cloth.

"We very frankly and warmly advise all Gardeners, Nurserymen, and the Proprietors of Gardens or Land, to procure this valuable Abridgment of Mr. Loudon's. We are sure they will find themselves abundantly repaid for its cost."—*Paxton's Magazine of Botany.*

*** The original Work, THE ARBORETUM ET FRUTICETUM BRITANNICUM, in Eight Volumes, Four of Letterpress (8vo, 1838), illustrated by above 2,500 Engravings, and Four of octavo and quarto Plates, may still be had, 10*l.* cloth.

London: Longman, Brown, Green, and Longmans.

Published this day, fcap. 8vo. 5*s.* 6*d.* cloth,

A COMPREHENSIVE VIEW of the CULTURE of the Vine, under Glass, from the Embryo Bud to the permanent Bearing of the Plant. By James Roberts.

Dr. Lindley's opinion on specimens of five varieties of Grapes from young Vines two years planted, exhibited at the Royal Hort. Society's Rooms, Regent-street, London, Sept. 7th, 1841:

"For size and weight of bunches we should think they have never been surpassed." [The large silver medal was awarded them.]

"As a plain and practical treatise on the subject, it is the best we have ever met with."—*Wakefield Journal.*

London: Longman, Brown, Green, and Longman.

On Saturday, the 7th of January, 1843, will be published, the First Number of a new Weekly Periodical, price 4*d.*, or stamped 5*d.*, to be entitled the

ILLUSTRATED POLYTECHNIC REVIEW.—This journal will be devoted to Science, the Fine Arts, and Literature. Each number will contain an Essay or Essays on some branch of Science or the Fine Arts, together with other highly-interesting matter. The Review will be printed on a fine paper, with a new type, and will comprise 48 closely-printed columns 4to. The whole to be illustrated with numerous fine Engravings, by the first artists.

Letters, Essays, Works for Review, &c., to be addressed to the Editor, 143, Strand, London, where Advertisements will be received.

A NARRATIVE of a VISIT to the AUSTRALIAN COLONIES, by James Backhouse.—This work contains a narrative of a visit, of six years, to the Australian Colonies, with descriptive Notices of the Countries visited, their Natural History, Aborigines, Emigrant and Prisoner Population; also Observations on the Penal Discipline, and on Emigration, &c. It is printed in one volume, of 700 pages, demy 8vo, and illustrated by three newly-engraved Maps, fifteen Etchings on Steel, and several Woodcuts, and is expected to be ready for Publication in the first month, 1843. The price to Subscribers, 14*s.*, to be paid on delivery; to Non-subscribers, 16*s.* A few copies with plates on India paper, 20*s.* Subscribers' names received by James Backhouse or J. L. Linney, York.

PUNCH; or, the LONDON CHARIVARI, is published every Saturday. Price 3*d.*

*** *The THIRD Vol. will be published on the 26th inst.*

PUNCH'S ALMANACK will be published on the 31st instant. And

PUNCH'S POCKET-BOOK is now on sale, price 3*s.* 6*d.*, roan tuck.

Office, 13, Wellington-street; and sold by all Booksellers.

In small 8vo, price 2*s.* cloth, gilt edges,

EVERY LADY HER OWN FLOWER GARDENER. By Louisa Johnson. Third Edition, containing a Chapter on [illegible] Gardening by Mr. M'Intosh, and Instructio[illegible] of domestic Greenhouses.

[illegible] ith the above, price 2*s.* cloth boards,

[illegible] ANDSCAPE GARDENING and LAYING OUT GROUNDS. By James Ma[illegible] A. L. S., Author of "Popular Botany," &c.

Also, in small 8vo., price 2*s.* cloth, gilt edges,

ON THE CULTURE OF THE VINE IN POTS, and ON THE COILING SYSTEM. By J. Mearns, F. H. S., Curator of the Botanic Garden, Leeds.

London: W. S. Orr and Co., Paternoster-row.

To begin precisely on the 1st of January.

No. 1.,

THE GARDENERS' EDITION of the Botanic Garden, at Sixpence a Month. ("The money's nothing.") The work will contain coloured Copper-plate Engravings. It will contain Sixteen Wood Engravings. It will contain plain descriptions of the best Flowering Plants, the best method of management, and everything else that's useful. What more can be desired?

If you don't order the Gardeners' Edition at Sixpence, you disregard cheap moral gratification.

THE FIELD, the GARDEN, and the WOODLAND. By Miss Pratt. With numerous Woodcuts. Second edition. Price 4*s.*

"'The Field, the Garden, and the Woodland,' bears in its title-page its own recommendation for those who hold that

'He is happiest who has power
To gather wisdom from a flower.'

. . . The book appears to be executed in the right spirit, and to contain a store of genuine anecdote and information."—*Athenæum.*

"With regard to 'The Field, the Garden, and the Woodland,' the circumstance of a second edition being called for proves that its merits have been appreciated; and as it received the favourable award of most of the public prints on its first appearance, there is but little occasion for any additional confirmation from us."—*Britannia*, Aug. 1840.

FLOWERS and THEIR ASSOCIATIONS. By Miss Pratt. With coloured plates. Price 6*s.*

"There are few works which to the uninitiated appear so generally dry and repulsive as those of a botanical character. They contain long lists of hard words and crabbed definitions, which, but for the evidence of our senses, would lead to the conclusion that a plant or flower is the least attractive object in nature. A botanist is sometimes nothing more than a clever anatomist, absorbed in the mysteries of dissection, lost to all feeling of the beautiful, insensible to sweet sounds and exquisite forms, and alive only to the question of orders and classes. To such a person the work would have few recommendations, but to us, who care but little whether a flower have five stamens or ten, and be classed as Pentandria or Decandria, and yet would yield to none in a love of flowers, this is exactly the book that we would take with us in a walk through green lanes and meadows, to read when sitting under the shade of a hedge or overspreading tree, with the very objects treated of in the work lying at our feet. The book is about wild flowers; about their traditions—their symbolical characters—the customs connected with them—their times and manner of blowing—of opening and shutting—their fragrance, forms, and colours. In short, without omitting to notice their botanical names and medicinal properties, it contains all the poetry of the subject, instead of the mere skeleton it would have been rendered in the hands of some writers. The work is illustrated with coloured plates, is got up in the style of books intended for presents; and we have seen few that we would more readily put into the hands of young persons, to make them lovers of nature, than this of flowers and their associations."—*Westminster Review.*

London: Charles Knight and Co., 22, Ludgate-street.

TO NURSERYMEN, FLORISTS, and Others.—To be LET on very advantageous terms, in a very superior situation, a few miles on the south of London, eight Acres of Land, held on lease for 22 years, with a good Dwelling-house, Seed-shop, Forcing and Green-houses, Pits, and Frames, Nursery Stock (not large), Plants, &c., &c. For particulars apply to Mr. John King, Auctioneer, Hackney-road.

TO MARKET-GARDENERS and Others.—To be LET about four Acres of good Land, as Market-Garden, on very advantageous terms, the Stock (which is small), to be taken by valuation. Good Dwelling-house, Stables, Sheds, and every convenience that is needful for carrying on the business. Apply for particulars to Mr. J. King, Auctioneer, Hackney-road.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at Worton Cottage, Isleworth, upon application to the gardener—*Sundays excepted.*

WHITE HART HOTEL AND HORTICULTURAL GROUNDS, BROMLEY, KENT.

W. PAWLEY begs most respectfully to call the attention of the Nobility and Gentry wishing to purchase specimens of Stove and Greenhouse Plants for exhibition to his Collection, which is equal and not to be surpassed by any Nurseryman's in the neighbourhood of London. Catalogues of the Stock will be sent Gratis on application. W. P. also begs to state that the above Hotel has an advantage over many, as the apartments open into the grounds, with additional conservatories attached, rendering it in every respect desirable for Families and parties wishing for a retreat at a convenient distance from the Metropolis, where they may insure every accommodation and comfort upon moderate terms. Bromley is particularly healthy, and beautifully situated in an excellent neighbourhood ten miles from town.

CAUTION TO FAMILIES.—The high reputation and consequent great demand of the undermentioned Articles have excited the avarice of some Shopkeepers, who, to get a trifle more profit, attempt to impose on the Public *highly-pernicious* Compounds as the real MACASSAR OIL for the hair, and KALYDOR for the complexion; they copy the labels and bills of the original Articles, substituting either an *assumed* name, or the word GENUINE in the place of ROWLAND'S.

*** To frustrate such imposition, it is necessary, on purchasing either Article, to see that the word "Rowland's" is on the wrapper as follows:—ROWLAND'S MACASSAR OIL, price 3*s.* 6*d.*; 7*s*; or Family Bottles (containing four small), 10*s.* 6*d.*; and double that size, 21*s.* per bottle. ROWLAND'S KALYDOR for the Skin and Complexion—Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle. "A. Rowland and Son, 20, Hatton Garden, London," is written in red on the wrappers of the MACASSAR OIL and KALYDOR, and engraved on the Government Stamp affixed on the Kalydor. Be sure to ask for Rowland's Articles. Sold by them and by respectable Chemists and Perfumers.

KEENE'S PATENT CEMENT.

THIS CEMENT is harder than any other known, and is especially fitted for the Walls of Hothouses, Conservatories, &c., as it neither cracks nor vegetates, and is perfectly impenetrable by insects.

The entire range of Hothouses erecting by the Government at Frogmore are about being stuccoed with it, and the price ranges nearly equally with the Cements in ordinary use for floors, and it forms a paving harder and cheaper than Portland Stone.

Patentees and Manufacturers, J. B. White and Sons, Millbank, Westminster.

PATRONISED by all the principal Architects and Builders in this Country and Abroad.——SEYSSEL ASPHALTE.—In consequence of the daily attempts made to imitate this valuable mineral production, and of the name of "Asphalte" being given to most of the spurious and "cheap" materials, the Directors of this Company particularly recommend Architects, Builders, and others, (for the purpose of securing the use of the genuine article,) to insert in their specifications "The Seyssel Asphalte, Claridge's Patent," and not merely "Asphalte" or "Bitumen," as, in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. For the information of those residing at a distance from London, and of those who, having employed the spurious composition, may, from its failure, have become prejudiced against the use of Asphalte, the following are mentioned as some of the distinguishing qualities of the genuine material. The Asphalte of Seyssel is of a light colour, closely resembling Yorkshire stone, has a smooth surface (without being slippery), and joints almost imperceptible; it is also free from smell, is not acted upon by change of temperature, and is at all times dry and warm, and remarkably pleasant to walk upon, and, from its elasticity, never cracks. The fictitious material, on the contrary, has a dark and dirty-looking appearance, presents a rough and coarse surface, and, from its brittleness, is liable to crack, particularly in frosty weather. In consequence of the above qualities, the genuine material (being perfectly impervious to wet) has been used with great advantage for roofing; it can be laid down to any extent, presenting one uniform surface, and is far superior to lead, as it is not liable to expansion or contraction in consequence of any change in the temperature. For covering of arches, (to prevent the percolation of wet,) it is invaluable, the Greenwich Railway Company alone having covered upwards of 400,000 superficial feet; it has also been used on the Great Western, Birmingham, Midland Counties, South Western, Brighton, Blackwall, and other Railways; at the joint Stations, London-bridge, and at the South Metropolitan, Highgate, and Nunhead Cemeteries. As proof of the great durability of the genuine Asphalte, it need only be mentioned that the first work executed in this Country with this material, (amounting to 3,952 feet,) was at Whitehall, opposite the Horse Guards, in the month of April, 1838, and which, although only half an inch in thickness, has remained up to this time (a period of four years and eight months) in the most perfect condition. Books of Testimonials with scale of prices may be obtained on application to J. Farrell, Secretary.

Seyssel Asphalte Company's Depot, Stangate, London.

Note—Neither the pavement in Parliament Street, London, nor the works at the Model Prison, at the Abney-park Cemetery (which from its failure has since been removed), or at the Hotel at the Slough station of the Great Western Railway, were executed by this Company.

TARPAULINS for GREENHOUSES, CAPES, &c.—On SALE, New Tarpaulin of Thick or Thin Canvass, as required, and Waterproof, 2*s.* per square yard, made up to any size, and particularly recommended for Frames and Greenhouses in the *Gardeners' Chronicle.*—A large quantity of Policemen's Second-hand Tarpaulin Capes, lined with Cloth, for Labourers and Farm Servants, at 2*s.* and 2*s.* 6*d.* each.—All kinds of Garden, Fishing, and Sheep-folding Nets.—Robert Richardson, Net and Tent Maker, 21, Tonbridge-place, New-road, near Euston-square, London.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. Abbott, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.—City Office, 98, Gracechurch-st.

LUFF & CO.'S PIANOFORTES.—Purchasers are reminded that L. & Co. are the only Makers where exchange is allowed regardless of time, and where a Professor is in constant attendance to select for Purchasers. Boudoir, Piccolo, Cottage, Cabinet, and Semi-Grand Pianofortes in elegant variety, at prices that defy competition. Pianofortes for hire, very cheap. No charge for package. Instruments taken in exchange.—Luff & Co., 103, Great Russell-street, Bloomsbury.

MECHI'S DESKS, DRESSING-CASES, WORK-BOXES, No. 4, Leadenhall Street, London, are Elegant, Useful, and reasonable in price, (with a large stock to choose from,) at Mechi's Manufactory and Emporium of Elegancies. Tea Caddies, Bagatelle-Tables, Papier-Maché Articles, and everything for the toilet and work-table. Elegant Tea-Trays Twenty Guineas the set; Bagatelle Tables, Work-Boxes, Envelope and Writing Cases; and a splendid variety of Papier-Maché Articles.

DOMESTIC COMFORTS. — The IMPROVED ENEMA FOUNTAINS, originally invented by JOHN READ, are well worthy the attention of every person subject to indigestion, costiveness, and other complaints of the stomach and bowels. They are patronised by the Nobility, and acknowledged by the highest Medical authorities as being superior to all others, and are so improved that Females and Invalids may now use them without the assistance or presence of a second person. The above may be fitted to bidets, and are most powerful "douche ascendants," will discharge water in a constant stream a distance of thirty-feet. These little instruments are likewise fitted with reservoirs, to contain the liquid, and may be conveyed in the pocket to any place ready for use. Fitted with tubes, (for exportation) that are durable as the instrument itself, and are not liable to be out of repair, even in the hottest climate.

Manufactured and sold by the Patentee, 35, Regent-circus, Piccadilly; sold also by his appointed agents in town and country.

Observe the words "Read's Patent," without which none are genuine. The above will be sent to any part of the kingdom on receipt of a post-office order. Price of the Fountain, 2*l.* 2*s.*; ditto, with Reservoir, 2*l.* 5*s.*

CHRISTMAS PRESENTS AND NEW YEAR'S GIFTS.—The season having arrived wherein by exchange of presents we confirm the stability of friendship, all classes of the community who would successfully cultivate regard by acceptable offerings will avail themselves of ROWLAND'S MACASSAR OIL, and ROWLAND'S KALYDOR—each of infallible attributes. In creating and sustaining luxuriant silken Tresses, the Macassar Oil is highly appreciated by Rank and Fashion, and patronised by all the Sovereigns of Europe; and Rowland's Kalydor is a preparation of unparalleled efficacy in purifying the skin, protecting it from the baneful effects of inclement weather, and characterising the complexion with transcendant brilliancy! No Presents can be more recommendatory, or more now in general use.

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 17, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—MEETING AT DERBY, JULY, 1843.

PRIZES FOR IMPLEMENTS.

For the Plough best adapted to heavy land, 20*l.*; for the Plough best adapted to light land, 20*l.*; for the Drill which shall possess the best method of distributing compost, or other manures in a moist or dry state, quantity being especially considered, 30*l.*—N.B. Other qualities being equal, the preference will be given to the Drill which may be best adapted to cover the manure with soil before the seed is deposited. For the best Scarifier, 15*l.*; for the best Chaff-cutter, 10*l.*; for the Draining Tile for agricultural purposes, which shall have been *boná fide* sold at the cheapest rate during the past year, regard being had to the local circumstances affecting the cost of production, and which, in the opinion of the Judges, shall be sufficiently durable, 10*l.*; for the best set of Harrows, 10*l.*; for the best Agricultural Carriage, with or without springs, for the general purposes of road and field, 20*l.*; for the best and cheapest Stack-covering, to supersede Thatching, 20*l.*; for the best Drill-Presser, 10*l.*; for the best Churn, 5*l.* The Society wishes to call the attention of Machine-makers to Improved Steam Apparatus for Roots,—to small or Portable Corn Mills,—to Broad Shares for paring Stubbles,—to a Rake for collecting Couch,—to Agricultural Harness and Gearing generally: for which Prizes or Medals will be awarded by the Judges. The Judges will especially consider the selling-price of the Implements exhibited, which must be stated in the certificate; and they are instructed to withhold Prizes where there shall not appear to be sufficient merit. Printed Forms of Certificates of Entry by Exhibitors may be obtained of the Secretary, at No. 12, Hanover-square, London, and must be returned to him, filled up, by the 1st of June, 1843; the Council having decided, that in no case whatever shall any Certificate be received after that date. All Implements must be in the Show-yard before Nine o'clock on the evening of Friday, the 7th of July; and all Implements so admitted will be liable to be proved by actual trial on the recommendation of the Judges. The Judges will make a selection of such Ploughs and other Implements as appear to them to possess peculiar merit, and reserve their final decision, where necessary, until they shall have tested them in a subsequent trial, to be hereafter arranged, and to take place at a suitable season of the year.

By Order of the Council,
London, Dec. 10, 1842. JAMES HUDSON, Secretary.

ROYAL BOTANIC SOCIETY OF LONDON.

GARDENS, INNER CIRCLE, REGENT'S PARK.—The Exhibitions for the year 1843 will take place in these Gardens on the following days, viz.:—

Wednesday, May 24;
Wednesday, June 28; and
Wednesday, July 26.—From 2 till 7 o'clock.

By order of the Council,
JAMES DE CARLE SOWERBY, SECRETARY.

MANCHESTER CUCUMBER SHOW, OPEN TO ALL ENGLAND,

will be held at Mr. JAMES HEWITT'S, Eagle Inn, Stretford New Road, Manchester, on Friday, March 24th, 1843. Subscriptions of 5*s.* each must be paid to Mr. HEWITT, the Landlord, before the 1st of February; after that time no one will be allowed to enter. The Ipswich Society's standard will be the Society's guidance of the judges (the rib excepted). All the Fruit must be staged by 3 o'clock, or they will not be allowed to be exhibited. Dinner on the table at 5 o'clock.

MESSRS. DICKSON, NURSERYMEN AND FLORISTS,

Acre Lane, Brixton, beg to inform Amateurs and Florists that their Catalogue of Carnations, Picotees, Auriculas, &c., is now ready, and may be had on application to them, or Messrs. WARNER and WARNER, Seedsmen, &c., Cornhill, London.

TO GENTLEMEN PLANTING FOR IMMEDIATE EFFECT.

J. OGDEN begs to recommend his fine Stock of *extra Large* PORTUGAL LAUREL, PHILLYREA, SIBERIAN ARBOR VITÆ, RHODODENDRONS, &c., &c., as being particularly handsome well-grown Plants, in fit state to remove with perfect safety; and the Nursery being advantageously situated for Canal or Railway Conveyance, so that they may be conveniently removed to any part of the country, he respectfully solicits orders for the same, which may be had on moderate terms, as well as a general Assortment of Nursery Stock.—Coventry, December 15, 1842.

BRAGG'S ANTAGONIST, the successful WHITE DAHLIA.

—W. BRAGG begs to inform Dahlia-growers in general, that he intends sending out (through the Trade, who will receive the usual allowance) his SEEDLING DAHLIA ANTAGONIST, in May next; Plants, 10*s* 6*d.* each. The quality of this flower is too well known to need description, as, in addition to its having produced the best White, by being awarded Mr. Wildman's prize of 5*l.* 5*s.*, it was placed first at the Salt-hill Grand Seedling Show, September 16, where 25 varieties of 1842 were placed for competition; 6 blooms were also shown at the Floricultural Society of London, September 27, making the third time of its being shown, where 6 blooms were required for each exhibition; likewise exhibited at the Isle of Thanet and Teddington Shows, which will attest its constancy, it being well known that only four of the six plants bloomed, which composed the whole stock. As only a limited number of plants can be made, W. B. pledges himself to execute the orders in strict priority, and will publish a list early in January of the Trade who will be able to supply plants in spring.

A few Ground Roots of BRAGG'S Great Western Dahlia, at 3*l.* 3*s.*, to be disposed of.—North Star Tavern, Slough. Nov. 16, 1842.

CHARLES FARNES, No. 128, ST. JOHN-STREET, LONDON,

respectfully informs the Public that his Collection of New KITCHEN-GARDEN SEEDS are now ready to send out. Owing to the fine harvest, the quality is excellent, and will be found to give general satisfaction. C. F. being connected with the principal Market-Gardeners round London and in the Provinces, is enabled to select the best and most choice varieties from their original sources.

Farnes' Superior First Early Peas—this has been the first Pea brought into Covent Garden Market for some years past—height, 1½ to 2 ft.
Flack's Dwarf Blue Victory Pea, 2 ft.
Knight's Blue Dwarf Wrinkled do., 3 ft.
American Dwarf White do., 3 ft.
Improved Green Marrow do., 4 ft.
Auvergne, new variety, do., 4 to 5 ft.
Young's Large Milford Marrow do., 5 to 6 ft.
New Giant Wrinkled do., 6 to 7 ft.
Marshall's Early Prolific Beans
True Dwarf Green Fan do.
Extra Large Green Windsor do.
New-England Long-podded do.
Transparent Early Frame Radish
French Early Olive-shaped do.
Scarlet Turnip do.
White Dutch do. do.
White Spanish Onion
Brown Deptford do.
Dutch Silver Pickling do.
New White Globe do.
James Keeping do.
Imptd. Early Dutch Horn Carrot
Large Altringham do.
,, White Belgian do.
Ady's fine Large Cos Lettuce
True Paris White do.
,, ,, Green do.
Black Seed Bath Cos Lettuce
Siberian Green do.
Large Malta Cabbage do.
True White Silesian do.
Walcheren White Broccoli—the best and earliest variety in cultivation.
Myatt's Fine Early White Cape do.
Chappell's Large do. do. do.
,, Splendid Cream do.
Walton's Yellowish-White do.
Knight's Self-protecting do.
Earliest London-saved Cauliflower
Imported Brussels Sprouts
Seymour's Superb Solid White Celery
True Giant Manchester Red do
Superior Early Dwarf Cabbage
Early Dwarf York do.
,, ,, Crompton do.
Large Early Hope do.
True Drumhead Savoy
Imported Early Dutch Turnip
Early Round Nonesuch do.
True Dark Blood-Red Beet
Large Silver-stemmed do.
Imported French Sugar do.
,, ,, Summer Endive
,, ,, Yellow-leaved do.
Dwarf London Green Curled do.
Morgan's Early Nonesuch Potatoes
True Early Ash-leaved Potatoes.

With every variety of Vegetable and Flower Seeds in cultivation; a general Catalogue of which, with prices, will be forwarded on application.

DAHLIA FLEUR DE GAND (VAN HOUTTE'S).

Delicate-veined, clear lilac, noble form; has got the first prize for the best Belgian or Foreign Bloom exhibited.

Ground-roots, 5*l.* Pot-roots, 3*l.* Plants in May, 10*s.* 6*d.*

DAHLIA SOUVENIR DE GAND (VAN HOUTTE'S). Maroon and crimson, fine form, colours new and exceedingly pretty; one of the best and most constant Dahlias in existence.

Ground-roots, 5*l.* Pot-roots, 3*l.* Plants in May, 10*s.* 6*d.*

Both guaranteed by the Grower, LOUIS VAN HOUTTE, of Ghent, Florist to the King of Belgium.

PHLOX (VAN HOUTTE'S). Stem 3½ ft. high; panicles 2 ft., erect; corymbs of flowers compact, large; corollas quite plain, pure white, with a large amaranth stripe in the middle of each Petal. (Was sent for inspection by the grower to Dr. Lindley.)

Plants in May . . . . 10*s.* 6*d.*

No Discount allowed unless 6 Plants are taken.

Orders at the Nursery, Ghent; or at the London agent's, Mr. JOHN NORMAN, Shipbroker, Water-lane, Tower-street, London. All letters for Belgium (through the Post-office) must be prepaid. The General Catalogue for the autumn 1842 is to be had. New Camellias, Rhododendrons (large stock of R. barbatum, from 1*l.* to 5*l.*); the new Achimenes grandiflora, Paulovnias, new Hepaticas (striped and others), Japan Lilies, large stock of L. lancifolium, Herbaceous Pæonies, large stock of all the new Roses, &c. Dutch Seeds, Haarlem Bulbs, &c., &c.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

FUCHSIA ST. CLARE.

—The above magnificent FUCHSIA was raised by Mr. Meehan, gardener to Colonel Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOUELL obtained the entire Stock. In May last it was submitted to Dr. Lindley for his opinion, which will be found in the *Gardeners' Chronicle* of the 14th of that month, as follows:—

"Your Seedling Fuchsia is by far the finest hybrid we have seen, the flowers being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

Messrs. YOUELL, in bringing this beautiful production into public notice, do so without the slightest diffidence, being fully assured of its giving the most entire satisfaction. It is of vigorous habit, fine foliage, and as a proof of its being a profuse bloomer, they have a plant in flower at the present time (September 15th), on one branch of which there are upwards of 200 blooms, forming a splendid object for the greenhouse, conservatory, or flower-garden. YOUELL and Co. purpose sending it out in the second week of April next, at 10*s.* 6*d.* per plant, free of postage to any part of the United Kingdom; and all orders they may be favoured with will be executed in rotation. Orders for the Continent will receive every care in packing, so as to ensure their safety. The usual discount to the Trade, when not less than six plants are ordered.

Messrs. YOUELL have also much pleasure in announcing that they are in possession of the entire Stock of two beautiful new Verbenas, raised by Mr. Edmonds, gardener to John Lacon, Esq., of Ormesby Hall, which were kindly presented them by that gentleman.

The one named LACONII is a fine blue, delightfully fragrant, of vigorous but compact habit, and the heads of flowers measuring upwards of three and a half inches in diameter.

The other, named PRINCESS ROYAL, is of the purest snowy white; the flowers remarkably large, and extremely fragrant; nothing can exceed the purity of the white in this beautiful variety, and it possesses that acquisition not to be found in any of its class—of retaining its clear white during fading. It would be as well to remark, that the petals of the flowers of the above meet so closely, as to form a perfect ball. They will be ready for sending out by post (free), to any part of the United Kingdom, in the second week of April, at 5*s.* 6*d.* per plant.—Great Yarmouth Nursery, Dec. 22, 1842.

P.S. Their Catalogue of Fuchsias may be had on application, and will be found to contain every variety worthy of cultivation.

Agents for STEPHENSON and Co.'s Improved Conical Boilers, and may be seen at this Nursery.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEES, AND LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM-RISE, NEAR LONDON, removed from Walworth, BY APPOINTMENT FLORIST TO HER MAJESTY, respectfully informs the Nobility, Gentry, and Public, that he has a fine Selection of the above Flowers, which he can offer at the following very moderate prices:—

RANUNCULUSES, 100 roots in 100 superfine sorts £4 4 0
Superfine mixtures from 5*s.* to 21*s.* per 100.
ANEMONES, 100 roots in 100 superfine sorts . . 3 0 0
Superfine mixtures from 7*s.* 6*d.* to 21*s.* per 100.
AURICULAS, 25 superfine sorts, 1 plant of each . 3 13 6
CARNATIONS, 25 superfine sorts, 1 pair of each . 3 10 0
PICOTEES, 25 superfine sorts, 1 pair of each . . 2 10 0
YELLOW PICOTEES, 12 superfine sorts, 1 pair of each 2 2 0
LILIUM LANCIFOLIUM ALBUM, from 5*s.* to 42*s.* each.
,, ,, PUNCTATUM, from 10*s.* 6*d.* to 42*s.* each.
,, SPECIOSUM, small bulbs, from 63*s.* each.

*** The Trade supplied.

CYCLAMEN EUROPÆUM.

—Four or Five Hundred strong Plants of the above in large 60 pots to be parted with, to the Trade or Public, in exchange or otherwise, in *any number.*—Apply to G. IMMS, Bowater Nursery, Woolwich.

THE FASTOLFF RASPBERRY.

—For many years past there has been cultivated in the neighbourhood of Yarmouth, adjacent to the ancient Castle of Sir John Fastolff, a red Raspberry of a most extraordinary size and rich flavour. The Nobility who visit the sea-coast here have invariably expressed their astonishment at the exceeding fineness of the fruit of this variety, and until lately YOUELL and Co. have not been enabled to obtain a sufficient stock of it to bring it into public notice; but having now obtained a supply (although limited) of fine Canes, beg to offer them on the following terms, and they can be sent with safety to any part of the United Kingdom, on the receipt of a Post-office order.

Packages containing 50 Canes, 25*s.*—Packages containing 25 Canes, 14*s.*—Package included.

The few to whom YOUELL and Co. have sent it, have expressed their high admiration of its superiority over other varieties; and a letter just received from a Gentleman in Derbyshire, to whom this variety was sent, states that it invariably takes prizes at the Hort. Shows in his neighbourhood. In conclusion, YOUELL and Co. beg to state that they have not, or do they intend to recommend any article but that which they can do with confidence; and in this instance they feel fully assured of its giving the most entire satisfaction.—Great Yarmouth Nursery, Norfolk, Dec. 22d, 1842.

SHIRLEY VINEYARD, NEAR SOUTHAMPTON,—NURSERY DEPARTMENT.

CLEMENT HOARE respectfully announces that he has now on sale an extensive collection of Grape Vine Plants of superior growth, and of the most approved sorts in general cultivation, varying in price from 2*s.* 6*d.* to 7*s.* 6*d.* each.

Lately Published,

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS. By CLEMENT HOARE. 2d edition. 8vo, 7*s.* 6*d.* boards. LONGMAN & Co., London. Sold by all Booksellers, and at the Vineyard at Shirley.

POTATO SEED FOR AMATEURS AND GARDENERS—GRATIS.

—A Gentleman who has saved Seed from a few of the very best varieties, and who feels great interest in the preservation and improvement of the breeds, will be happy to forward a pinch of seed to any one who will forward a stamped envelope (properly addressed to himself) to Mr. EDWARDS, care of Mr. HARE, No. 7, President-street West, Goswell-road.

ECONOMIC LIFE ASSURANCE SOCIETY,

No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being sea-faring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES,

upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

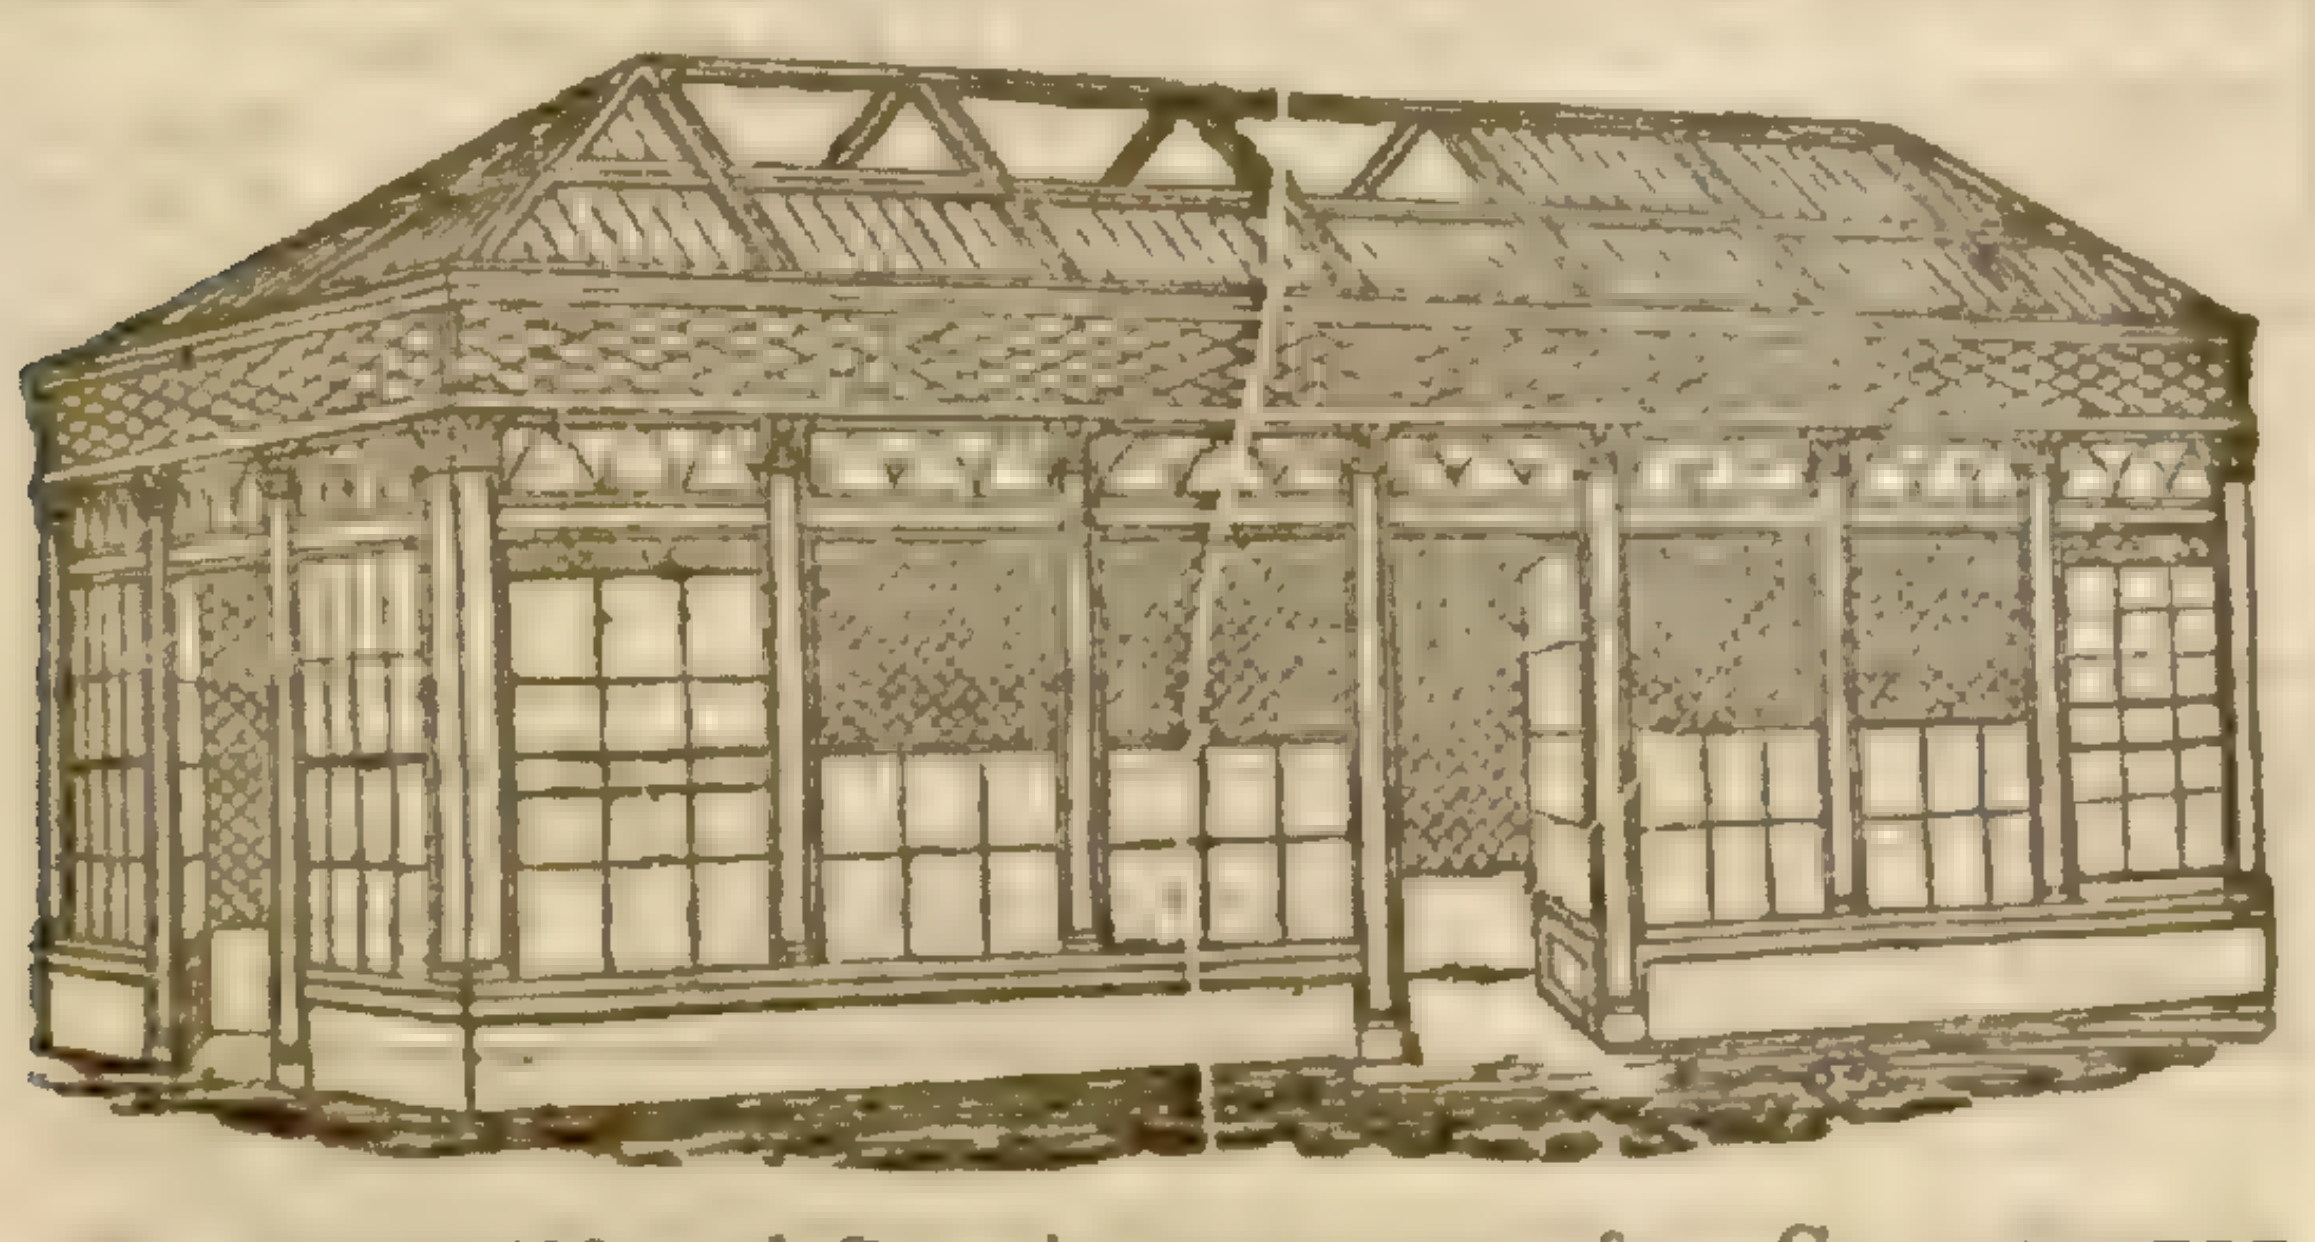
D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price *5l. 5s.* and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WAYTE's New Patent Land-presses and Drills.

HORTICULTURAL BUILDING and HEATING by HOT WATER



J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER PLACE, KING'S-ROAD, CHELSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

PENN'S SYSTEM PERFECTED—FOR OBTAINING A FREE CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL & OTHER BUILDINGS.

W. HILL having had every opportunity of making himself acquainted with the best method of constructing Horticultural Buildings of every kind—to command the above truly-desirable result—and having with much satisfaction witnessed the gradual improvement in the adaptation of this principle to almost every variety of Building, begs to announce to the Nobility and Public generally, that he erects CONSERVATORIES, HOTHOUSES, PITS, &c., &c., upon the above system, which has (*at an immense cost to the inventor*), been brought to *great perfection*, and heats the same by HOTWATER APPARATUS, with improved Tube or Conical Boilers. W. HILL also adapts DR. ARNOTT'S NEW BALANCED REGULATOR to the Boiler Apparatus, by which an immense saving of fuel is effected, the greatest regularity of Temperature preserved, and much time and trouble saved. PENN'S SYSTEM only requires publicity to be appreciated. The Public are therefore invited to inspect its efficient working at the Inventor's Residence, Lewisham. The great end gained by adopting this system, *is a perfect and rapid Circulation*, producing consequently an equable temperature throughout the building (of whatever construction), and renders access to it at all times safe and agreeable, ladies of the most delicate constitution being enabled to remain for hours in a temperature greatly exceeding summer-heat, with as much comfort as could possibly be derived from an out-door temperature equally high. W. HILL would refer any, who may desire to apply the above system to Forcing-Houses in particular, to Mr. JOHN WILLMOT, of Isleworth, who after 40 years' experience has adopted this system throughout his extensive Establishment. Designs, and any further information, upon application to W. HILL, Builder and Surveyor, Lewisham.

ECONOMIC HEATING APPARATUS.

W. HILL having repeatedly observed in the Columns of the *Gardeners' Chronicle*, inquiries for a cheap mode of heating small Greenhouses and Conservatories, begs to inform any who may hitherto have denied themselves a pleasing Recreation on account of the expense and trouble attendant upon either Water Apparatus, or the common Smoke Flue, that he engages to warm Buildings of the above description, upon an entirely new principle, with DR. ARNOTT'S NEWLY-INVENTED BRICK STOVE, at a cost of about one-fifth that of the most common mode by hot water. The following are some of its advantages, viz:—It occupies very little room, is altogether within the House, no Smoke or Dust, requires attention once in 24 hours, may be made very ornamental, costs in working from *2d.* to *6d.* per day according to size. May be seen in operation, by applying to W. HILL, Builder and Surveyor, Lewisham. W. HILL also adapts the above to Churches, Chapels, Public Offices, large or small Libraries, Picture Galleries, Nursery and other private Apartments, for which it is especially and admirably suited.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BROWN'S IMPROVED GARDEN POT.

ROBERT BROWN having made an important and successful improvement in the construction of Garden Pots, submits them to the Floricultural Profession, and to all who are interested in the propagation and cultivation of Plants. It is well known that many valuable plants are annually lost, or much injured, by having the delicate fibres of their roots dried up, from the pots in common use becoming heated by the sun's rays, or from exposure to drying currents of air, &c., for which evils a remedy has long been sought. The Improved Garden Pot now offered to the Public is intended to counteract this irregularity of temperature, by being made hollow-sided, with an aperture on the rim, that the space between the outer and inner surface may be filled with water when required, and the aperture being made air-tight by means of a peg, a uniform degree of coolness or humidity may be preserved, and the plants, although exposed to the mid-day sun, will have their roots secured from injury. The Improved Garden Pot does not differ in appearance from those in common use, but the advantages of its construction, for the growth of plants, or for the propagation of cuttings, are too obvious to need further comment.—R. B. has submitted his invention to several eminent cultivators, from whom he has received the greatest encouragement.

Specimens may be seen at the Horticultural Society's Rooms, 21, Regent-street, or at Mr. BROWN'S Pottery, Surbiton-hill, near Kingston, Surrey, and at his private residence, Ewell.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

GUANO ON SALE BY THE IMPORTERS,
ANTHONY GIBBS AND SONS, LONDON;
GIBBS, BRIGHT, AND Co., LIVERPOOL AND BRISTOL.

THE GENUINE GUANO ON SALE AT LIVERPOOL.—Any quantity of this celebrated and valuable natural Manure can be obtained from the Queen's Bonded Stores, either in Liverpool or in London. Apply to Messrs. WM. JOS. MYERS & Co., Importers, Liverpool; Messrs. COTESWORTH, POWELL, & PRYOR, Great St. Helen's, London; or Messrs. EDWARDS, DAWSON, & Co., Brokers, Liverpool.

This day is published, price *3d.*,

PUNCH'S ALMANACK FOR 1843, Brimful of Fun and Jokes, and containing upwards of One Hundred humorous Cuts. Also,

PUNCH'S LETTERS TO HIS SON. Revised and corrected from the original MSS. in the Bloomsbury Library, by DOUGLAS JERROLD. With 24 Illustrations by KENNEY MEADOWS. Price *5s.*

PUNCH'S PANTOMIME; or, HARLEQUIN KING JOHN, AND MAGNA CHARTA; as now performing at the Theatre Royal, Covent Garden. Price *1s.*

PUNCH; or, the LONDON CHARIVARI. Volume the THIRD. Price 8s. Published every Saturday, price *3d.*, and in Monthly Parts.

PUNCH'S POCKET-BOOK is now on sale, price *3s. 6d.*, roan tuck.

OFFICE, 13, Wellington-street; and sold by all Booksellers.

A NEW WORK ON GARDENING.

THE FIRST NUMBER of THE GARDENER and PRACTICAL FLORIST for the new year will be ready January 7th, illustrated with Wood Engravings, and containing 24 columns of valuable practical information on Gardening and Flowers. Published every Saturday, Price *3d.*

London: R. GROOMBRIDGE, 5, Paternoster-row, and sold by all Booksellers and Newsmen.

TRACTS ON BEES, BY THE REV. W. C. COTTON.

Now ready, price *6d.* each, or *5s.* per dozen,

TWO SHORT AND SIMPLE LETTERS TO COTTAGERS ON BEES. Letter I. On BEE-MANAGEMENT. Letter II. On the NATURAL THEOLOGY of BEES. By the Rev. W. C. COTTON, M.A., Student of Christ Church, Oxford; and Chaplain to the Lord Bishop of New Zealand.

RIVINGTONS, St. Paul's Church-yard, and Waterloo-place.

Also, by the same Author, just published,

MY BEE-BOOK. (*With 70 Engravings on Wood.*) Small 8vo. *12s.*

A NARRATIVE of a VISIT to the AUSTRALIAN COLONIES, by JAMES BACKHOUSE.—This work contains a narrative of a visit, of six years, to the Australian Colonies, with descriptive Notices of the Countries visited, their Natural History, Aborigines, Emigrant and Prisoner Population; also Observations on the Penal Discipline, and on Emigration, &c. It is printed in one volume, of 700 pages, demy 8vo, and illustrated by three newly-engraved Maps, fifteen Etchings on Steel, and several Woodcuts, and is expected to be ready for Publication in the first-month, 1843. The price to Subscribers, *14s.*, to be paid on delivery; to Non-subscribers, *16s.* A few copies with plates on India-paper, *20s.* Subscribers' names received by JAMES BACKHOUSE or J. L. LINNEY, York.

THE NUMBER FOR JANUARY NEXT WILL COMMENCE THE VOLUME OF

MAUND'S BOTANIC GARDEN, which, besides the former additions, will contain a portion of Professor Henslow's BOTANICAL DICTIONARY; and this will be continued in every succeeding Number till completed. The Dictionary will contain an explanation of upwards of 5,000 words, and nearly 200 illustrative woodcuts. The plates of Hardy Garden Flowers continue to be engraved and coloured in their usual beautiful style; and the FLORAL REGISTER, with 16 woodcuts of plants, and the AUCTARIUM, are given as usual.

Price 1s. 6d. Large, 1s. Small, per Month.

The January Number will afford a favourable opportunity for those who are fond of the open Garden to commence taking this now cheapest of all Botanical works.

London: SIMPKIN, MARSHALL, & Co.

Fourth edition improved, cloth neat, *2s. 6d.*

SMITH on the GROWTH of CUCUMBERS and MELONS, with ASPARAGUS, MUSHROOMS, RHUBARB, &c.

"His mode is excellent; we recommend the Work to all Cucumber and Melon growers."—*Loudon's Gard. Mag.*

London: SIMPKIN, MARSHALL, and Co., and all Booksellers.

In One Volume, 8vo, with numerous Wood Engravings, *20s.*

THE SUBURBAN GARDENER AND VILLA COMPANION; Comprising the Choice of a Suburban or Villa Residence, or of a Situation on which to form one; the Arrangement and Furnishing of the House; and the Laying-out, Planting, and general Management of the Gardens and Grounds; the whole adapted for Grounds from One Perch to Fifty Acres and upwards in extent; and intended for the Instruction of those who know little of Gardening and Rural Affairs.

"The most complete work on villa gardening that has ever appeared in our language."—*Quarterly Journal of Agriculture.*

"Not only those who are looking out for a house, but such as are settled in one already, be it small or large, will find much and available information. All who delight in a garden should possess this book."—*Spectator.*

"The whole work contains so much sound good sense, combined with the results of long experience, that it will be invaluable to every one who wishes to enjoy all the comforts of which a suburban residence is susceptible, with a due regard to economy; and it should be carefully perused by every person who resides in a house having a garden. We regard it, on the whole, as the most original, and as calculated to be the most extensively useful, of all Mr. Loudon's works, and we have no doubt it will effect as great a change in the appearance of the gardens and grounds of our suburban and other small villas, as Mr. Loudon's 'Encyclopædia of Cottage Architecture' has, in various parts of the country, effected in the appearance of the labourers' cottages."—*Times.*

London: LONGMAN, BROWN, GREEN, AND LONGMANS.

To begin precisely on the 1st of January.

No. I.,

THE GARDENERS' EDITION of the BOTANIC GARDEN, at Sixpence a Month. ("The money's nothing.") The work will contain coloured Copper-plate Engravings. It will contain Sixteen Wood Engravings. It will contain plain descriptions of the best FLOWERING PLANTS, the best method of management, and everything else that's useful. What more can be desired?

If you don't order the GARDENERS' EDITION at SIXPENCE, you disregard cheap moral gratification.

WANTS a SITUATION as SHOPMAN and CLERK in a Nursery and Seed Establishment, a Young Man, who has been engaged several years as above in one of the first London Nursery and Seed Houses, and is competent to take the journeys if required. Every satisfaction can be given as to character and ability. Address A. B., Messrs. J. A. HENDERSON and Co.'s, Nurserymen, Pineapple-place, Edgware-road, London.

WANTED BY HAYTHOW AND CO., a person as PROPAGATOR. Application to be made by letter only. Clapton Nursery, London, Dec. 21, 1842.

WANTED a Middle-aged Man as FOREMAN in a Nursery, who, although required to understand his business in all its branches, would be principally occupied in the propagation and cultivation of a small but select collection of Stove and Greenhouse Plants. None need apply whose character will not bear the strictest scrutiny for honesty and sobriety. For particulars, address B. D., Post-office, Tunbridge Wells, Kent.

Now published, price *10s.*,

A SECOND Edition of MILL'S TREATISE ON THE CULTURE OF CUCUMBERS, MELONS, SEA-KALE, and ASPARAGUS, with a descriptive Plate of his Pit, and also daily Notes of Practice from December to February inclusive.

Published by WM. SMITH, 113, Fleet-street, and sold by all Booksellers.

GREAT LEAGUE-FUND.—The ADDRESS of the NATIONAL ANTI-CORN-LAW LEAGUE to the Inhabitants of the Metropolis, of the date of the 13th instant, calls upon the Citizens of London and the Metropolis generally to organize and assemble in Public Meetings, to subscribe and otherwise aid the League in their public-spirited exertions to promote FREE TRADE, and to accomplish the Abolition of the Corn and Provision Laws.

To give effect to these objects, a distinct Association and separate Provisional Committees have been formed for the Metropolis—one Committee for the City, and another for the other districts of London.

These Committees will sit daily at 68, Cheapside:

John Travers, Esq., Provisional Chairman and Treasurer.

G. H. Heppel, Esq., Secretary and Sub-Treasurer.

At the British Hotel, Cockspur-street, Charing-cross:

The Hon. Charles P. Villiers, M.P., Provisional Chairman and Treasurer.

J. C. Symons, Esq., Secretary and Sub-Treasurer.

In the course of the week the Committees for the Metropolis, in aid of the above object, will be formed and advertised. A list of banking-houses will also be advertised, where subscriptions may be paid. The Provisional Chairmen, Treasurers, and Secretaries in the meanwhile will receive contributions.

PATRONISED by all the principal Architects and Builders in this Country and Abroad.——SEYSSEL ASPHALTE.—In consequence of the daily attempts made to imitate this valuable mineral production, and of the name of "Asphalte" being given to most of the spurious and "cheap" materials, the Directors of this Company particularly recommend Architects, Builders, and others, (for the purpose of securing the use of the genuine article,) to insert in their specifications "The Seyssel Asphalte, Claridge's Patent," and not merely "Asphalte" or "Bitumen," as, in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. For the information of those residing at a distance from London, and of those who, having employed the spurious composition, may, from its failure, have become prejudiced against the use of Asphalte, the following are mentioned as some of the distinguishing qualities of the genuine material. The Asphalte of Seyssel is of a light colour, closely resembling Yorkshire stone, has a smooth surface (without being slippery), and joints almost imperceptible; it is also free from smell, is not acted upon by change of temperature, and is at all times dry and warm, and remarkably pleasant to walk upon, and, from its elasticity, nevercracks. The fictitious material, on the contrary, has a dark and dirty-looking appearance, presents a rough and coarse surface, and, from its brittleness, is liable to crack, particularly in frosty weather. In consequence of the above qualities, the genuine material (being perfectly impervious to wet) has been used with great advantage for roofing; it can be laid down to any extent, presenting one uniform surface, and is far superior to lead, as it is not liable to expansion or contraction in consequence of any change in the temperature. For covering of arches, (to prevent the percolation of wet,) it is invaluable, the Greenwich Railway Company alone having covered upwards of 400,000 superficial feet; it has also been used on the Great Western, Birmingham, Midland Counties, South Western, Brighton, Blackwall, and other Railways; at the joint Stations, London-bridge, and at the South Metropolitan, Highgate, and Nunhead Cemeteries. As proof of the great durability of the genuine Asphalte, it need only be mentioned that the first work executed in this Country with this material, (amounting to 3,952 feet,) was at Whitehall, opposite the Horse Guards, in the month of April, 1838, and which, although only half an inch in thickness, has remained up to this time (a period of four years and eight months) in the most perfect condition. Books of Testimonials with scale of prices may be obtained on application to J. FARRELL, Secretary.

Seyssel Asphalte Company's Depot, Stangate, London.

Note—Neither the pavement in Parliament Street, London, nor the works at the Model Prison, at the Abney-park Cemetery (which from its failure has since been removed), or at the Hotel at the Slough station of the Great Western Railway, were executed by this Company.

TARPAULINGS, POLICE-CAPES.—8,000 Yards of Tarpaulings on Sale, at *2s.* per square yard; made up to any sizes, same price. It is perfectly waterproof, and is suitable for Roofs, Stack and Waggon Covers, Greenhouses, Frames, &c. &c. Above 1,000 second-hand London Policemen's Tarpauling Capes, lined with cloth, redressed and waterproof, *1s. 9d.*, *2s.*, and *2s. 6d.* each, suitable for Gardeners, Shepherds, Carters, Labourers, and Farm-servants. Garden-Nets, Rabbit-Nets, Sheep-Nets, and Fishing-Nets of all kinds.—ROBERT RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New-road, near Euston-square, London. Samples sent.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.—City Office, 98, Gracechurch-st.

CAUTION.—Several Perfumers of apparent Respectability, for the sake of gaining a trifle more profit, basely attempt to impose their *pernicious compounds* upon the public as the *real* "MACASSAR OIL" for the Hair, and "KALYDOR" for the Complexion. They copy the bills and labels of the original articles, substituting either a *fictitious name*, or the word "GENUINE" in the place of "ROWLAND'S." *To frustrate such imposition*, it is necessary, on purchasing either article, to see that the word ROWLAND'S is on the *wrapper*, as follows, without which *none are genuine*. ROWLAND'S MACASSAR OIL, for the growth, and for Beautifying the Human Hair. Price *3s. 6d.*, *7s.*, or Family Bottles (containing four small) *10s. 6d.*; and double that size, *21s.* per bottle. ROWLAND'S KALYDOR, for the Skin and Complexion. Price *4s. 6d* and *8s. 6d.* per bottle. A. ROWLAND AND SON, 20, HATTON GARDEN, LONDON, is written in red on the wrappers of the MACASSAR OIL and KALYDOR, and engraven on the Government Stamp affixed on the Kalydor. Be sure to ask for "ROWLAND'S" Articles, Sold by them and by respectable Chemists and Perfumers.

HORTICULTURAL SOCIETY OF LONDON.
This Day is published, Price 3*s.* 6*d.* to Fellows of the Society, and 5*s.* to Others,

A CATALOGUE OF THE FRUITS Cultivated in the Garden of the HORTICULTURAL SOCIETY OF LONDON. Third Edition. Sold at the House of the Society, 21, Regent-street; and also by Longman and Co., Paternoster-Row; J. Hatchard, Piccadilly; Ridgway, Piccadilly; Rivingtons, Waterloo-place; and by the principal Booksellers in all parts of the Empire.—N.B. A few Copies of the 2nd Edition may be had at the reduced Price of 1*s.* 6*d.* each.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 24, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Dec. 27	Zoological	8½ P.M.
Monday, Jan. 2	Entomological	8 P.M.
Wednesday, Jan. 4	Geological	8½ P.M.
Friday, Jan. 6	Botanical	8 P.M.

ALTHOUGH, as we stated last week, the thorough drainage of land is one of the most certain and immediate methods of improving its productiveness, yet it is not the only means to be employed. Manuring is just as necessary; and fortunately this too is to be effected mainly by manual labour, applied to the collection and application of materials now utterly and enormously wasted.

In the matter of manures we are as barbarous as the savages of Asiatic Russia; and, one would think, as ignorant. Bountiful Providence takes care that in proportion as population is dense, the means of feeding that population should be multiplied. But man, unable to comprehend these admirable arrangements, wastes the materials intended to sustain him. We read in Mr. Murchison's Account of the Black Earth of Russia (Journ. R. Agr. Soc., 3, 128), that the peasants of Central Russia are so prejudiced against the use of manure, that "enormous piles of this substance, the accumulation of ages, are seen behind most villages and towns, forming hillocks of considerable magnitude, the export of which might really form a very beneficial trade to those countries more advanced in agriculture, and whose poorer soils are worthless without repeated dressings of manure." People hold up their hands with astonishment at the ignorance of these serfs. What a pity it is that they do not look at home! They then would find it quite unnecessary to import improvidence from Central Russia—plenty of that may be had in England.

Upon this subject we would refer the reader to the *Report of the Poor-law Commissioners on the Sanitary Condition of the Labouring Population*;[*] a most important document, founded upon actual evidence produced to the Commissioners in 1842. They prove to a demonstration that there exists in this country an enormous mass of the richest fertilising materials, not only wasted, but assisting in the production of an amount of pestilence of which few persons have an idea. In one year this has caused 56,461 deaths, for England and Wales alone, which is "as if the whole county of Westmoreland or Huntingdonshire, or any other equivalent district, were entirely depopulated annually, and were only occupied again by the growth of a new and feeble population, living under the fears of a similar visitation!" The annual amount of persons who perish from preventible causes, mainly brought on by the deleterious effects of those very substances wanted to fertilise our fields, is stated to be "double the amount of what was suffered by the Allied Armies in the battle of Waterloo." It is the vast accumulation of putrid matter in ditches, courts, alleys, and houses,[†] and in their immediate vicinity, which pollutes the air and produces contagious fever. It is this very same matter which, when restored to the soil, renders it capable of bearing new crops of produce.

Wherever we look, in turning over the pages of this Report, a repetition of the same sickening details meets the eye. In the villages we have in all directions accounts of fearful mortality brought on by accumulations of all manner of filth—ditches filled with putrefying matter, stagnant pools, and choked-up drains. Cloacine and rotting animal and vegetable matters are continually found heaped up, and unemployed, or suffered to run to waste. In Bilston we have choked-up drains, green pools, intolerable stench. At Stafford, in the low parts of the town, there is no provision made for refuse dirt, which is thrown down in front of the houses and allowed to putrefy; and these nice places, filled with the vilest offal, form "the back entrances into the houses of the principal streets" (Report, p. 16). In one part of Macclesfield, all kinds of offal, dead animal and vegetable matter, are heaped together—a foul and putrid mass, disgusting to the sight, and offensive to the smell. In the poorer parts of Liverpool and Manchester, Wigan, Durham, Barnard Castle, Carlisle—a beautiful city, girdled with filth—Gateshead, the manufacturing towns generally, and of course in London, the horrid condition produced by the accumulation of decaying matter is perfectly indescribable, and we must refer our readers to the Report itself for details (especially page 30). We can hardly credit the evidence of our senses when we see that all this vileness is to be met with in England, which claims so much credit for cleanliness and propriety. One instance, however, is so remarkable as to hold a bad preeminence over all others. At p. 13 the Commissioners report, that of all the towns visited, A. is the worst beyond all comparison. From the gas-works extends a double line of open, deep, black, stagnant ditches. From these ditches an intolerable stench is perpetually rising, and produces fever of a severe character. Cases of typhus fever are frequent; and at the time of the Reporters' visit, 7 or 8 persons were attacked in two streets. Other drains still more intolerable than the last are specified. The openings to the sewers of this town are exceedingly offensive in hot weather; the ditches are sometimes emptied; and their contents, when placed upon the land, injure the meadows, *by the extraordinary strength of the manure*. Now the town where these abominations are permitted to endure—where typhus fever rages, and the purest atmosphere is thus polluted by the ignorance and laziness of man, is—WINDSOR, the seat of Royalty!

Here, then, is an incalculable source of mischief, on the one hand, and of wealth on the other, which only requires labour to convert it from a misery to a blessing. There is no conceivable reason why labour should not be thus applied. For the collection, removal, and application of these substances there are people enough to be found; it is only necessary that some one should direct them what to do. Parish officers should cause the poor to be employed in gathering together such matters for sale to farmers and gardeners; and, in order to destroy the nuisance of collecting them, they should use some of the disinfecting agents, which might easily be had at a cheap rate. If the collection and purification cost more than the material could be sold for, the loss should fall on the parish, and be paid for out of the poor-rates; it would be a cheap price to give for the removal of what contaminates the air we breathe. If the law in its present state will not sanction such a proceeding, the law should immediately be altered; and, in the mean while, individuals should everywhere subscribe their funds to the working out so good an end. Suppose the wealthier inhabitants of every parish were to furnish the money thus to employ the poor, and were to divide the loss, if loss there were, among them; would not that be a very good sort of charity? We have Societies for all sorts of purposes—why not for the Suppression of Pestilence as well as the Suppression of Mendicity? It would be a good work, and surely God's blessing would be upon it.

But we shall be told that there would be no market for the materials thus gathered together; and that, if there were a market, no one would subscribe the money required for their collection. Why, how is this—that in a country like England, where skill and capital so much abound, there is this unwillingness to apply either to the most productive of all sources of wealth and happiness, the employment of the poor and the improvement of the soil! What unseen power can it be that guides the capital of the country into foreign mines, foreign loans, mad usury, wild schemes of locomotion by land and sea, and all the jack-o'-lanterns of speculation? Certainly not apathy, nor want of skill, nor hardness of heart, nor ignorant supineness. What is it then?

We cannot answer that question; but we see that at a county meeting in Hertfordshire some time since, some observations were made on the subject which are worth recording. One of the speakers stated, that if long and liberal leases were substituted for the tenant-at-will system, or if the landlord were required to give compensation for improvements on dismissing a tenant, we should hear of no want of employment in our rural districts. These sentiments are said to have been loudly cheered at the time, and the subject has since been the subject of much conversation at the market tables of the county. We hope it will continue to be so; but, in the mean while, the labourer *must* be employed: and we urge upon those concerned the importance of employing him this very winter in the manner we have suggested. A man cannot wait for tardy lawgivers when his food is in question. Give bread, blankets, or coals to the poor who are aged and infirm; but give work to the poor who are able-bodied, and pay them properly for it—not a shilling a-day, as some are now doing, and claiming credit for their self-seeking charity, but a reasonable remuneration for a fair day's work. To take advantage of a poor man's necessity by giving him sixpence for what is worth a shilling is cheating, disguised like charity.

We cannot conclude these observations better than by another extract from the Commissioners' Report: "The condition of large rural districts in the immediate vicinity of the towns, and of the poorer districts of the towns themselves, presents a singular contrast in the nature of the agencies by which the health of the inhabitants is impaired. Within the towns we find the houses and streets filthy, the air fœtid: disease, typhus, and other epidemics rife amongst the population, bringing, in the train, destitution and the need of pecuniary as well as medical relief: all mainly arising from the presence of the richest materials of production, the complete absence of which would in a great measure restore health, avert the recurrence of disease, and, if properly applied, would promote abundance, cheapen food, and increase the demand for beneficial labour. Outside the afflicted districts, and at a short distance from them, as in the adjacent rural districts, we find the aspect of the country poor and thinly clad with vegetation, except rushes and plants favoured by a superabundance of moisture: the crops meagre, the labouring agricultural population few, and afflicted with rheumatism and other maladies, arising from damp and an excess of water, which, if removed, would relieve them from a cause of disease, the land from an impediment to production, and, if conveyed for the use of the town population, would give that population the element of which they stand in peculiar need, as a means to relieve them from that which is their own cause of depression, and return it for use on the land as a means of the highest fertility. The fact of the existence of these evils, and that they are removable, is not more certain than that their removal would be attended by reductions of existing burdens, and might be rendered productive of general advantage, if due means, guided by science, and applied by properly qualified officers, be resorted to."

WE last year brought prominently into notice the statements made by Mr. Webb Hall respecting certain extraordinary effects ascribed by that gentleman to what is called Daniell's Manure; and we added that our private information confirmed those statements.

Some experiments made this year on Grass, and with kitchen-garden crops, in the garden of the Horticultural Society, have proved by no means favourable to this manure; and we perceive by the Proceedings of the Bath and West of England Agricultural Society that Capt. Scobell, and other gentlemen, have reported that the instances of its action, which have been examined by them, do not justify the high character that has been given of it. On clay land in grass it had produced no visible effect; and on meadow land in another place there was no perceptible difference between the parts unmanured and those which had been dressed with Daniell's manure. These gentlemen also state that at Kingsweston, on some land of Mr. Miles, this substance had been used with Wheat with no sort of advantage; and, as the general result of their inquiries, they report "their unanimous opinion that Daniell's manure had failed to produce those beneficial results they expected to have witnessed; but whether any peculiarity of the season, the nature of the soil, or other causes of which they had no knowledge, had counteracted its fertilising quality, they could not tell. They recommended that a trial should be made in the ensuing year upon soils and in situations different. It remained, too, to be proved, now that the land on which the committee reported was more fully impregnated with the manure, whether it would not produce more favourable results next year."

On the other hand, Mr. Blake, of Warminster, a practical and well-known agriculturist, stated that "a friend of his had tried 100 bushels of the patent manure on a field of Turnips, upon a part of which also he had tried bone-dust, and the result was, that he gave the greatest preference to the patent manure. He had himself tried it on Wheat, a part of which was manured with other manure; finding some part of the Wheat looking very unhealthy, he had used some of the patent manure, and the result had been most beneficial; as, although that part of the Wheat had been sown five weeks after the other, it was ripe within three or four days of the other. Mr. Bennett, also, than whom no man was more accurate and careful in his mode of agriculture, had tried 150 bushels of it on Swedes, a portion of which same field was manured with bone-dust, guano, and other manures; and he expressed himself highly satisfied with the effects of the bone-dust and the patent manure, and that he firmly believed them to be far superior to all other manures. He, however, added, that although he had known it to be most successful in many instances, there were also instances of failure. Captain Scobell also stated many instances of the results of the manure, some of which were successful, and others not. Mr. Webb Hall also continued to bear testimony to its effects, having tried 500 bushels of it in various ways, and sometimes under the most unfavourable circumstances. He had ever found it successful, and thought the instances of failure were to be attributed to its not having been sufficiently diffused over the land, as it was of too caustic a nature to be applied in a concentrated state. Last year had been a season of drought, which accounted for its failure on grass lands, as it was of that volatile character, that unless washed in by rain, its volatile parts were swept away. It was a manure which was intended

---

[*] An 8vo volume of 457 pages.

[†] This was found in London, in the parish of St. Giles, in a large public thoroughfare, to take place in the cellars, to the depth of three feet, in houses letting at from 30*l.* to 40*l.* a year each (p 45.)

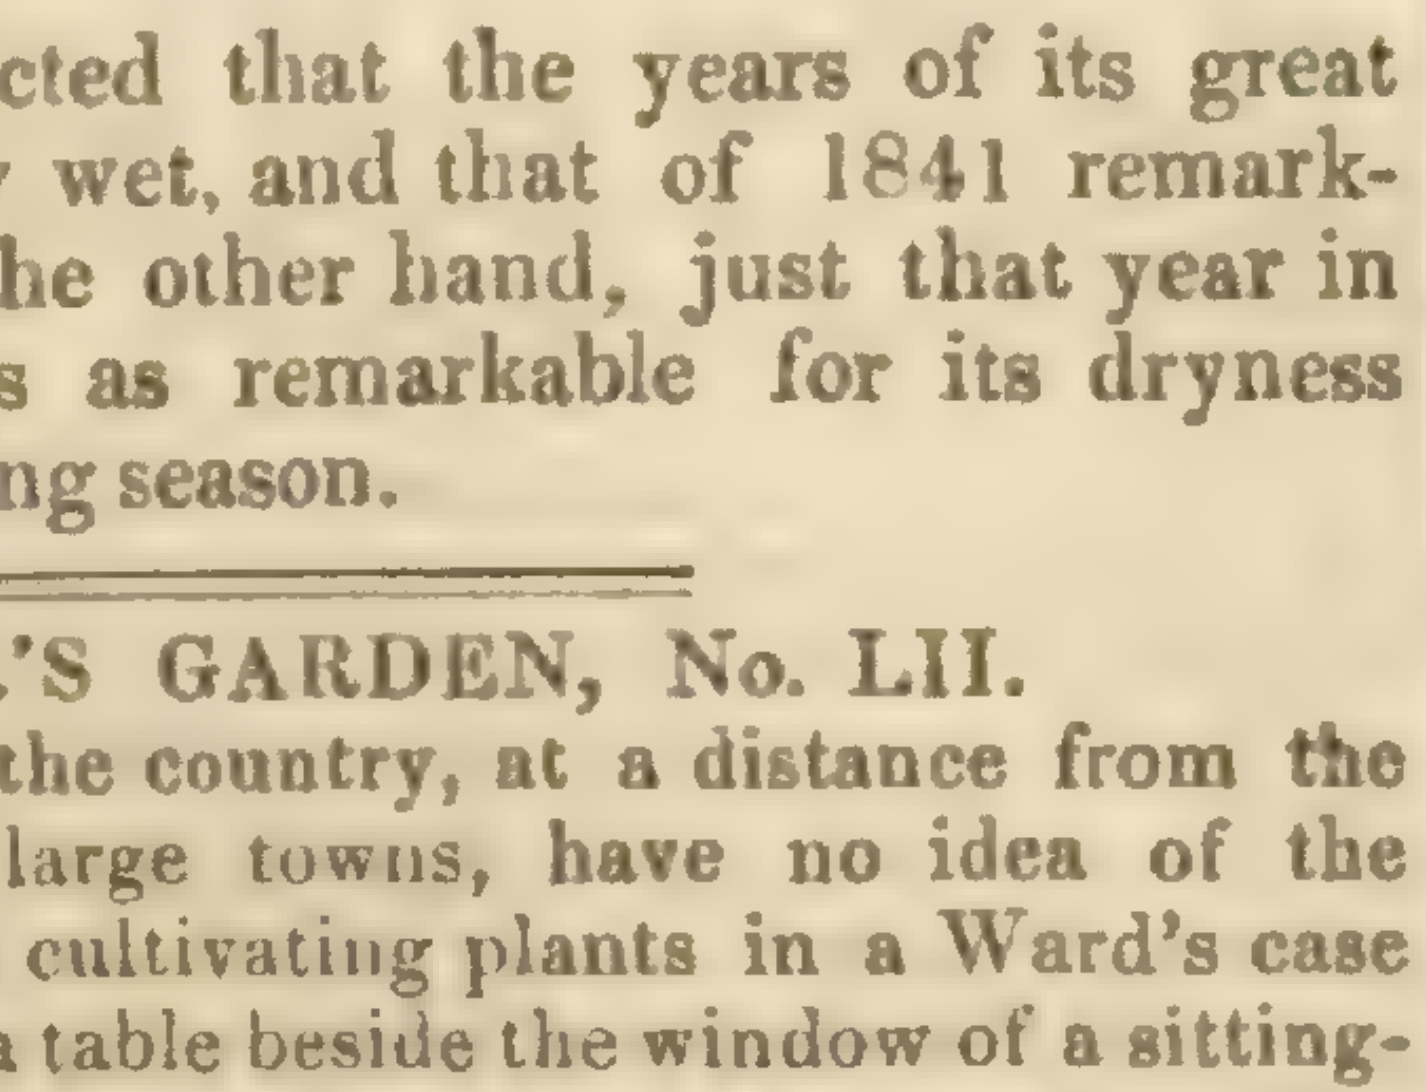
"to be diffused, and not applied to the land by "means of the drill."

This last statement probably explains in part the cause of the conflicting evidence above produced. It is, however, a question with us whether it will ever succeed so well on heavy land as on light, for which, from its viscid quality, it seems best suited. If applied to heavy land, it should probably be applied before winter, so as to become thoroughly blended with the soil before the dry weather of spring can set in.

It is to be recollected that the years of its great success were all very wet, and that of 1841 remarkably so; while, on the other hand, just that year in which it failed was as remarkable for its dryness during all the growing season.

AMATEUR'S GARDEN, No. LII.

Those who live in the country, at a distance from the smoke and dust of large towns, have no idea of the pleasure derived from cultivating plants in a Ward's case which is placed upon a table beside the window of a sitting-room. In such situations, unless plants are protected by some contrivance of the kind, their leaves get covered with dust, or they are completely burned and destroyed by the excessive heat which is reflected by the pavement and walls of the houses. There have been several sketches of these little greenhouses published in the columns of this Paper, but none, in my opinion, so handsome as that which is now presented to the reader. The case from which it has been taken is in the possession of C. B. Warner, Esq., who has it in his town house, in the heart of the city of London. It is placed on a very ornamental box, which is filled with soil, in which Ferns and several other plants grow in great luxuriance. Some little plants of different kinds are also suspended from the top, and have a very pretty appearance. Another important matter connected with its formation is, that a person can always, by means of a door in the side, get his hand readily in to do what is necessary to the plants; or the case itself can be easily lifted off, should that at any time be thought necessary. This is a most important arrangement in the construction of all articles of this kind; if it is not attended to, the plants are sure to be sooner or later neglected. The expense of such a case as this, the frame-work being made of brass, would be about 8*l.*; but then it forms a piece of very ornamental furniture; it could, of course, be made cheaper of some other substance, such as zinc, but it would not look so well in a room which is nicely furnished. In order to give an idea of its real size, I may mention that it is three feet long, and that all the parts are drawn according to actual measurement.



I mentioned before, that although articles of this kind should fit well, it is not necessary for them to be air-tight, as is generally supposed. The action which goes on, and with which they are connected, is principally mechanical—that is, the water of the soil and leaves, which is turned into vapour by the influence of heat by day, becomes condensed upon the inside of the frame, and is returned again as soon as the air becomes cool in the evening. Thus the plants can be kept in high health with but little care, and their leaves retain that bright green colour which refreshes the eye so much in the midst of a crowded city, where window-plants generally look so stunted and unhappy.

Besides Ferns, several other plants may be introduced—such, for example, as Lycopódium stoloníferum, a pretty branching Moss, which would soon cover the under part of the frame; and I have even known the Pitcher-plant, in a young state, and Venus' Fly-trap, which are plants of great interest, succeed well in such places. Then there might be suspended from the top, in the highest situations, small plants of the pretty Mammillárias. The amateur would thus possess a frame containing objects which would afford the highest gratification to himself and his family.—*R. F.*

ENTOMOLOGY.—No. XXXVIII.

The Parasol Gall-fly (Cynips umbraculus.)—The remarkable economy of this family of the Hymenoptera, and the little that is known, even by Entomologists, of the species, in connexion with the singular excrescences which they have the power of creating, will be a strong inducement to take up the subject from time to time, with a hope of making the gardener better acquainted with these little animals. I wish to refer the reader to some general remarks that were made when I entered upon the history of the Cynips aptera,* a species which forms its galls upon the roots of trees under the surface of the earth, and I have now an opportunity of detailing the economy of one which forms its nidus upon the sprigs of an Oak, presenting such an extraordinary conversion of the fruit into galls, that it is well deserving the attention of every one who takes an interest in the wonderful works of the insect race.

I am informed by Dr. Lindley that the Oak affected is the Quercia Castagnara of the Italians, and the specimens were sent from Naples by the Hon. R. Keppel Craven; it seems to be a variety of Quercus sessiliflora. The twigs with the galls were gathered in the Valley of Sevenno, in the Principato Citra, between Salerno and Avellino, about four miles from the former city and the sea, but at some elevation above it. Having never seen anything which presented the slightest resemblance to these grotesque forms, I thought they must be the productions of a nondescript species; but it is said there is nothing new under the sun, and so it proved in this instance, for I find the fly described in the "Encyclopédie Méthodique," under the name of Diplolepis umbraculus, and it is the "Diplolèpe de la Galle en parasol" of the French, who have discovered it in the South of France.

The galls are formed towards the extremity of the twigs of the Oak, and one I observed was attached to the stalk, about a quarter of an inch below the perfectly-formed cup, from which an Acorn had fallen; I presume, therefore, that these galls are monstrous forms of the fruit-buds, into which the eggs, or rather a single egg, of the Cynips is inserted as soon as the fruit is set; the galls are attached by a very short stem, which is expanded into a large sort of ruff, having a few ridges and points upon the surface, and the margin is deeply indented or toothed, forming longish pointed irregular rays; this ruff is reflexed or bent back, so as to envelop the Oak-stalk, and tightly embrace it at the lower extremity; it is 3 or 4in. in circumference, and from the centre arises a stem or pedestal surmounted by a table or parasol; this is smaller than the ruff, but similarly toothed; the stem is nearly half an inch thick, and on the top, exactly in the centre of the table, is a little elevation or tubercle. The whole of the gall is of a reddish-brown colour, and coated with a gummy substance, so thin and adhesive, that several insects were as completely fastened down by it, as if they had been varnished over; amongst them I observed some small Diptera (Molobri, I believe), a Miris, also an Altica, and a female Cynips umbraculus. In dividing one of the galls, I found a cavity beneath the aperture (*a*), which contained an oval case or shell as large as a pea: one end had a round hole in it, the interior was filled with the dust of the gall, and a female Cynips was lying dead just by the opening, as is frequently the case in the galls of other species. I may remark, that the internal substance of the galls is spongy and light, and the thickest part of the ruff and table is not more than the twelfth of an inch.

On examining the specimens of the Cynips umbraculus, both of which were females, only one appeared to inhabit each gall: they seemed to me to be very like the C. Quercus-radicis of Fabricius, but larger; they were of a chesnut colour, clothed with short ash-coloured hairs; on the thorax are three broadish black stripes, with a narrower one on each side; the scutellum is black at the base; the abdomen is variegated with the same colour, and the oviduct was exserted; the thighs are striped with black; the four wings are transparent; the anterior are ample, with the usual nervures of the Cynips, including the triangular areolet; the antennæ and legs were broken, but the former are black at the base; length, 2½ lines.

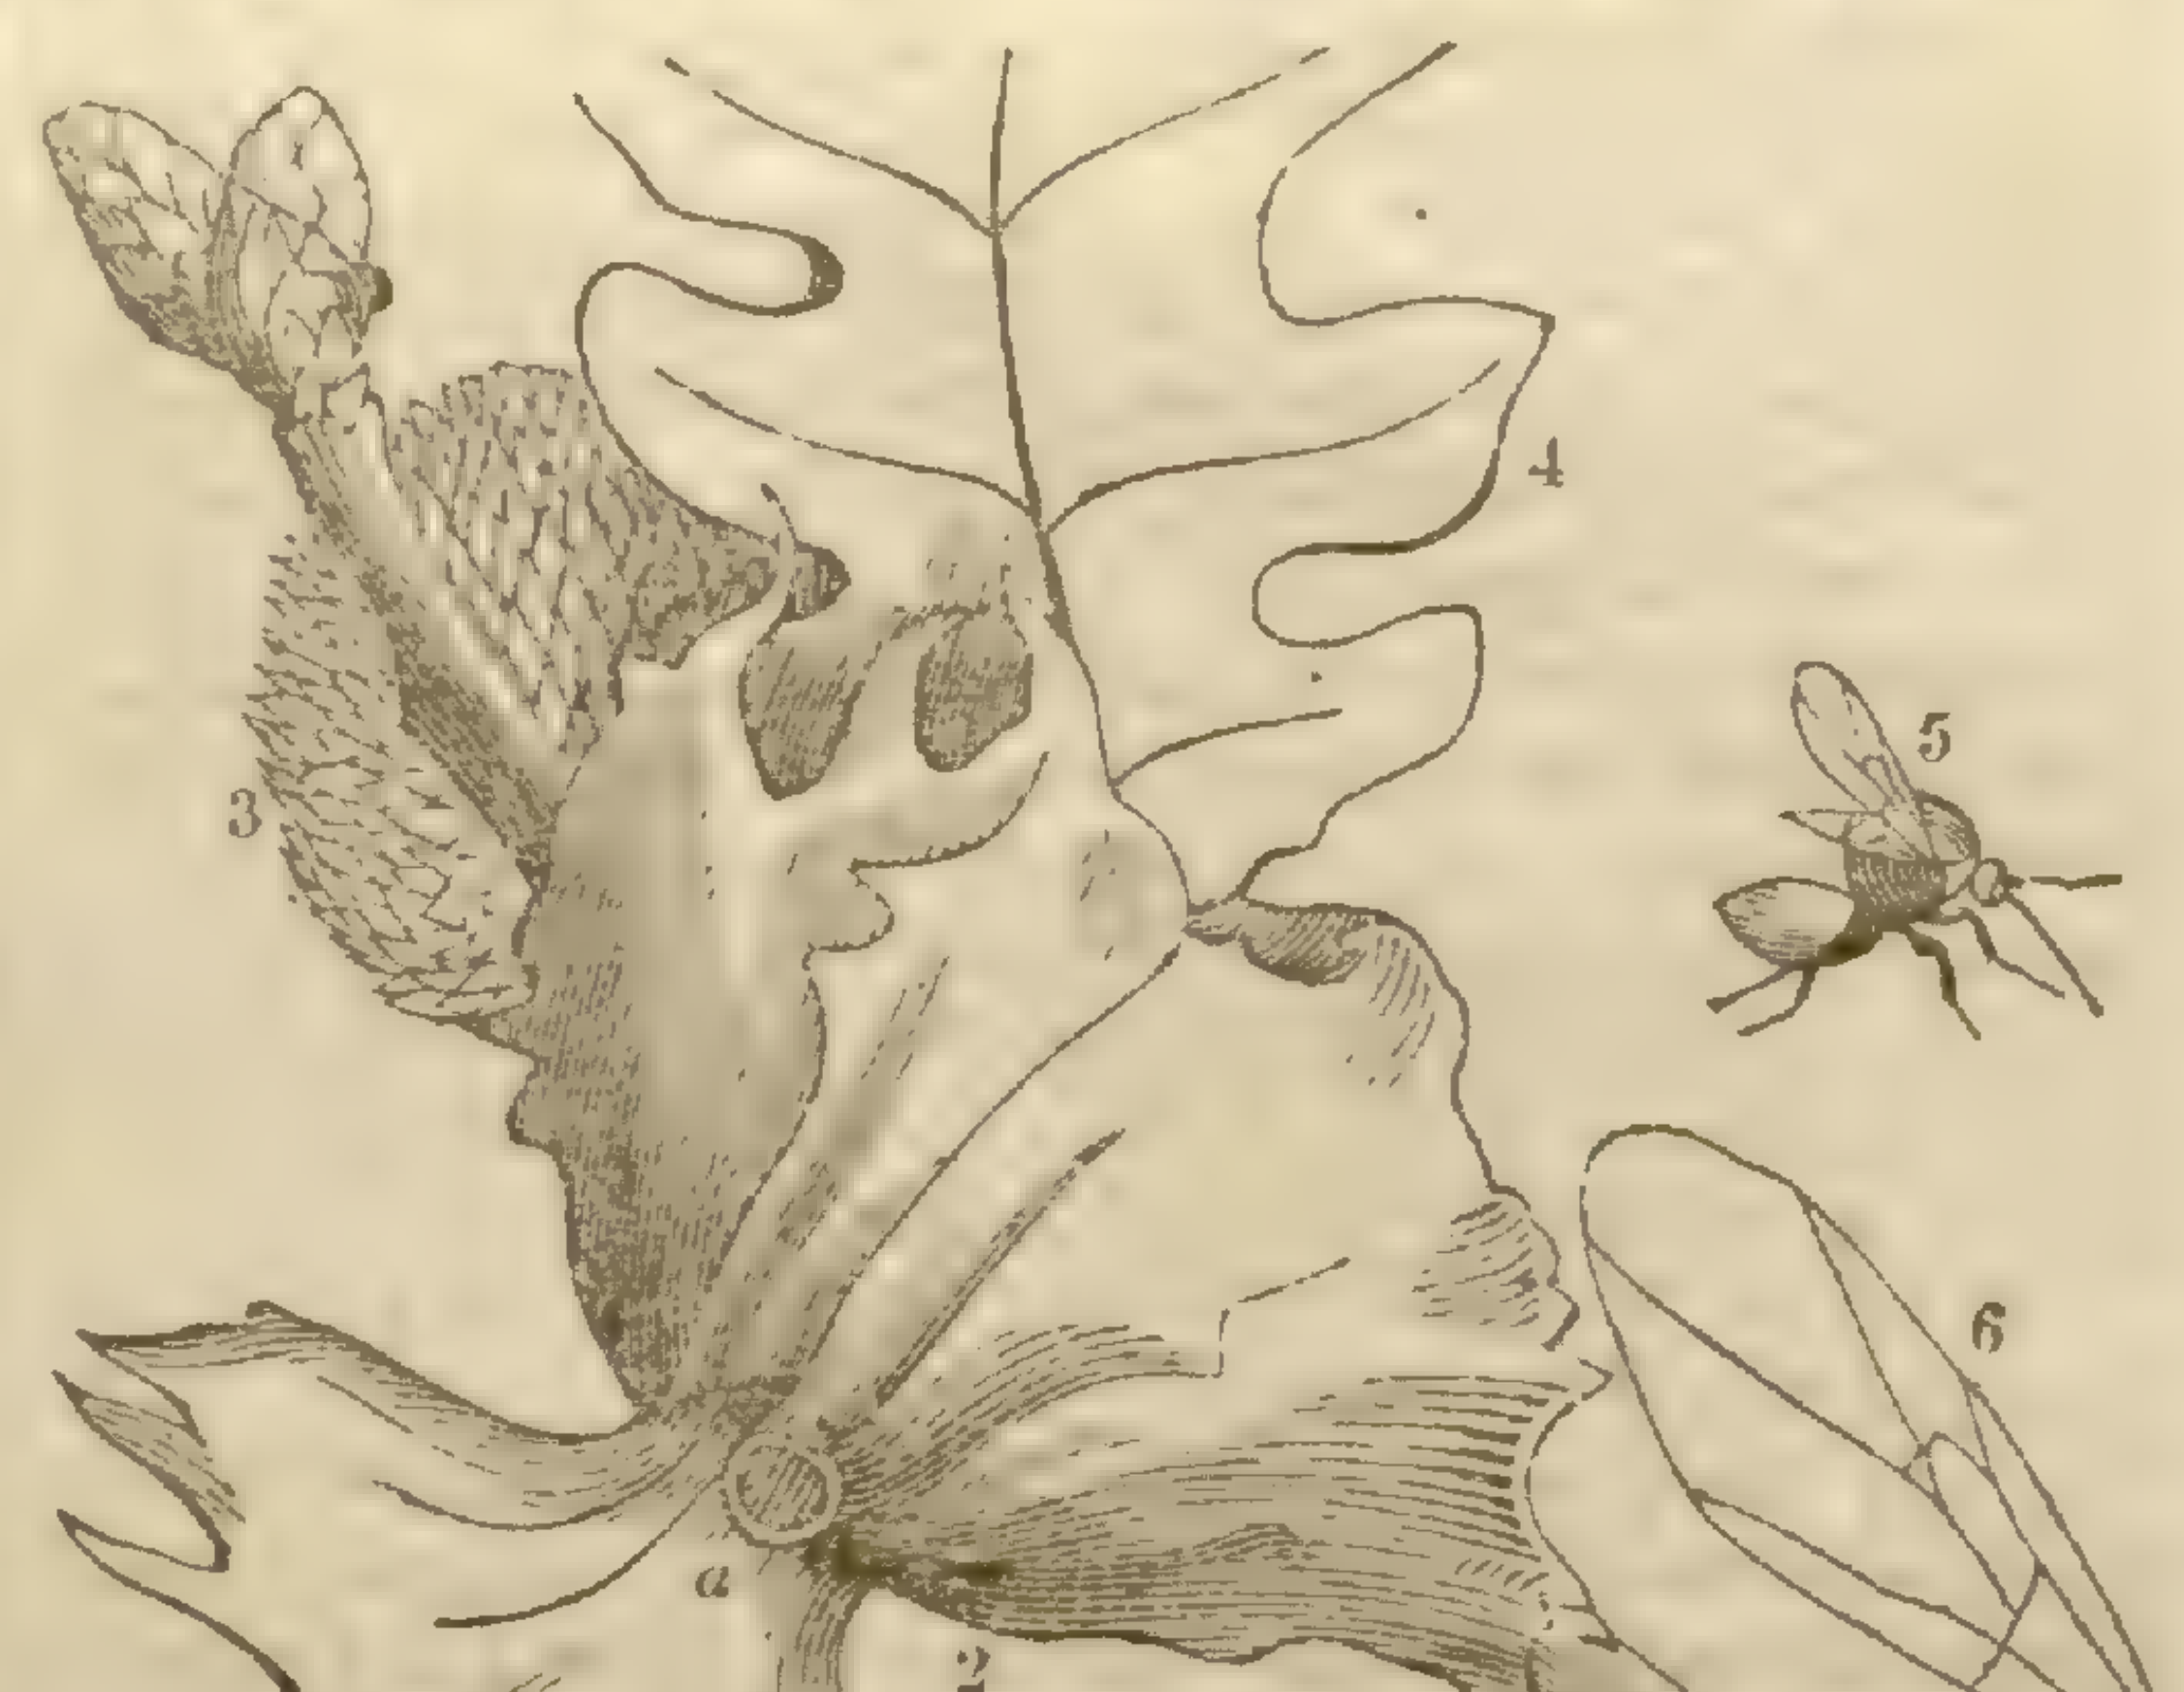


Fig. 1 represents a twig of the Oak; fig. 2 is the gall, with the aperture (*a*) at the union of the ruff and table, from which the Gall-fly had emerged; fig. 3 is the outside of an Acorn-cup; fig. 4, a portion of the Oak-leaf; fig. 5, the female Gall-fly, represented walking, and a little magnified; and fig. 6 is an anterior wing to show the neuration.—*Ruricola.*

PEARS.

The following observations may be useful to some of your correspondents. My trees are standards, growing unpruned on a sandy soil—on a dark tenacious clay, subsoil white clay, with chalk stones; and on a fine hazel loam, with a subsoil of reddish brick-earth. They are planted in occasional rows, extending over a surface of nearly 40 acres; and from what I have observed during several years, variation of soil does not appear to affect Pears so much as that of seasons.

Marie Louise: quality invariably good in all soils and seasons; for three seasons prior to that of 1841 the blossoms were destroyed by spring frosts. That year the crop was abundant; it has this year been the same.

Beurré Rance, 1839: flavour peculiarly fine; the fruit kept till June 1840; those of 1840 were also fine, and kept till the commencement of May, 1841. The greater part of those of the latter seemed cracked on the trees—others ripened prematurely; so that by Christmas none were left. This season has not been favourable for them, the greater portion cracking on the trees in Sept. I can compare this Pear, from standards here, to nothing but a fine-flavoured Melon; it is delicious. I have bought them in Covent-garden, from wall-trees, very large, but quite flavourless.

Althorpe Crassane, 1839: good and full-flavoured, keeping until the end of December; 1840, remarkably good, and kept till January 1841. Those of 1841 cracked on the trees, and ripened towards the end of October; the flavour was inferior. This season they cracked on the trees during the heavy rains in September, and have ripened prematurely with an indifferent flavour. In a garden five miles off, they are fine and delicious. This is a very hardy Pear.

Winter Crassane always bears abundantly. The fruit of 1839 kept until February, 1840; flavour, passable. Those of 1840 kept till January, 1841; their flavour was pretty good. Those of 1841 kept till March, 1842; flavour better than in the two preceding years. In severe seasons, this will be a valuable Pear.

Passe Colmar bears most abundantly, but seldom or never ripens its fruit; they remain hard and worthless till they rot.

Duchesse d'Angoulême grows well, blooms abundantly, but seldom bears.

Doyenné rouge is a good bearer, and a very excellent Pear in October.

Glout Morceau grows well, and bears moderately; the fruit but very seldom ripens well, unless placed in a warm chamber; it is inclined to spot on the tree, and is often small and irregularly shaped.

Beurré d'Aremberg bears well; those of 1841 kept till Jan. 1842; this season they are ripe now (Nov. 10). A variety of this Pear, sent from Mons. Van Mons, some years since, as the "true Beurré d'Aremberg," differs a little from the above; it appears to keep longer, the fruit of 1841 having kept till Feb. 1842, while my fruit of this variety are now hard and unripe. Its shoots are not so slender; its leaves are a little broader than those of the variety in usual cultivation, which come from the Horticultural Society of London. It appears to be a seedling from the same origin. The Beurré d'Aremberg of the French, which I have repeatedly seen in their nurseries, is evidently a strong-growing and large variety of the Glout Morceau. I have at a glance distinguished them when growing in the quarters of the French nurseries; the former will make a shoot of from five to six feet in one year from the bud, the latter barely reaching three feet: but it evidently belongs to the same race, and has the peculiar prominent buds and leaves of Glout Morceau, only longer.

Easter Beurré grows well, and blooms most abundantly; it produces but few fruit, and these never ripen kindly, being always hard and gritty at the core, and poor in flavour.

Buchanan's Spring Beurré is a Pear grown abundantly in the east of Essex and west of Suffolk. About Haverhill it bears immensely, and one season in five eats tolerably after Christmas: it certainly is no *Beurré*, but a baking or stewing Pear.

Bézi de Caissoy, or Nutmeg.—A very hardy and free-bearing small Pear, with a peculiar musky flavour; it keeps well till February.

Beurré Diel bears well, and grows freely: it requires a warm room to bring it to its full flavour. The fruit of 1841 kept till December, and those of the present season appear as if they would keep till the middle of December.

Hacon's Incomparable bears well, and is invariably first-rate. In 1840 it kept till the end of December; in 1841 it was fully ripe by the middle of November. They appear this season as if they would ripen in December.

Doyenné gris is a good melting Pear. In 1841 it ripened in December.

Bon Chrêtien Fondante, from the Horticultural Society, bears well, and ripens in October; but it is invariably mealy and poor.

Comte de Lamy bears most abundantly, and ripens in October; in 1840 it was fine and high flavoured; the same in 1841. This season it is poor and deficient in flavour.

Winter Nelis bears well; the fruit in 1840 kept till February; in 1841 they were fully ripe and over in November. Those of this season are now getting ripe, and will perhaps keep till the middle of December.

Belmont bears abundantly, and ripens in October; the flavour is indifferent.

Downton bears well, keeps till the middle of December, and is very juicy; the flavour is peculiar, and, I think, good.

Beurré de Capiaumont bears immensely, ripens towards the end of October, and is generally juicy and good. This season it is very inferior.

Rouse Lench bears most abundantly; the fruit is hanging on the trees now. It keeps till June, and, to use a friend's words, is "a Crab of a Pear;" it has never yet been "toothable" here.

Beurré Bosc bears well; in 1840 it kept till the middle of December; in 1841 until the middle of November. This season it ripened towards the end of October; its flavour is invariably first-rate.

Inconnue Van Mons, from M. Van Mons; a middle-sized green Pear, keeping until the end of February; juicy and high flavoured, apparently a valuable variety. It grows freely, and bears well.

Calebasse ripens in November, is crisp and juicy, and its flavour is moderately good.

Duchesse de Mars bears well, keeps till February, and its flavour is peculiarly musky, and very good: a melting Pear of first-rate quality for its season.

Thompson's grows and bears well, ripens towards the end of November, and is a delicious Pear.

Autumn Colmar bears most abundantly, ripens in October, and its flavour is very indifferent.

Beurré d'Amanlis is a free grower, and bears well: it ripens from the middle to the end of October. In 1840 its flavour was very high and delicious; in 1841 it was poor and mediocre. This season there has been no fruit.

---

* *Gardeners' Chronicle*, vol. i., p 732.

Fortunée.—This Pear, which, according to the French catalogues, was to keep till July, is now ripe, and proves to be a very good melting Pear.—*T. Rivers, Jun., Sawbridgeworth.*

HOME CORRESPONDENCE.

Ice-houses.—I am encouraged to send you the following observations upon preserving ice, trusting they may have some tendency to throw light upon that subject. I have long suspected that the prevailing practice of throwing salt among the ice, when filling an icehouse, was an error; I have therefore abandoned it for the last four years, and have since found that our ice keeps better than it did before, when salt was mixed with it. Our house is nearly of the shape of an egg, with the small end downwards: it is built of bricks, arched over; the door is a little above the middle, or between the middle and the top; with an arched passage, 10 feet long, and an outer door at the entrance of the passage. A drain is formed from the bottom of the pit, communicating with a pond below; this drain conveys the water from the house beneath the surface of that in the pond; so that no draught of air can pass up. Reed or straw is placed over the drain, and all round between the ice and the brickwork; and, when filled, a small space above the ice is stuffed full of straw. The inner door is then shut, the passage is filled with straw, and the outer door is closed. I believe this is the common method of proceeding; I only mention it to show that the same practice prevailed when this house was filled with ice with which salt was added, as is now adopted when salt is dispensed with. The ice in this house has always kept well, as the salt was formerly used in very small quantities; but it keeps much better now that no salt is allowed. Although the house was opened nearly every day throughout the last summer, there is now (9 Dec.) about one-third still remaining. I have no doubt the practice of using salt has arisen from the known fact that a mixture of ice and salt produces an intense degree of cold. In a temperature of 40° (Fahr.) a certain weight of ice takes, say 10 hours, to become fluid; in the same time, and with the same source of heat, 140 times the weight of water would be raised one degree in temperature; therefore 140 times the quantity of heat is required to convert ice into water as to raise the same weight of water one degree. Allowing the air and ice, when filling an ice-house, to be 32°, if salt is thrown upon the ice, a part of it immediately melts; and all that which melts, having no time to draw upon the atmosphere for its source of heat, viz. 140°, which is immediately destroyed in the act of melting, becomes in the water latent. This melted water and ice, being suddenly reduced in temperature, will lower the thermometer from 32° to zero. If only a small quantity of salt is used, the surrounding ice, which has not been reduced in temperature by melting with salt, will gradually give out some of its sensible heat, and will soon become equalised with that in immediate contact with the melting water; but the latter having partly disseminated itself through the whole mass, becomes partially saline, and its freezing point will be lowered in proportion to the quantity of salt used. After these sudden changes have taken place therefore, the difference between the salted and unsalted ice-house will be, that the latter is filled with ice at the temperature of 32°, and whose freezing point will remain 32°, while every grain of ice melted by transmitted heat will give the protection of one degree of cold to 140 grains of ice surrounding it; whereas, the former will also be filled with ice exactly at its freezing point, which may perhaps be 30°, and every grain of such ice, when melted by transmitted heat, will also give one degree of protection to 140 grains of the unmelted ice, or will counteract the transmitted and continually transmitting heat to that extent. But with what velocity will that heat be transmitted? Exactly in proportion to the difference in temperature between the stored ice and the medium which surrounds it. If we allow the surrounding medium to be 34, then the velocity of the transmitted heat from that medium to the ice will be twice as much in the salted house, viz., from 34 to 30, the difference being 4, as in the other, which would only be from 34 to 32, the difference being only 2; consequently, the ice would keep twice as long in the one as in the other. I do not pretend to say that these presumed temperatures are such as really occur; but they must of necessity approach it, and if so, the argument remains the same. I have also seen some observations, which appear to be made by intelligent gardeners, against having an ice-house under the shade of trees. I do not suppose my ideas are more likely to be right than theirs; but having a strong feeling in favour of such a situation, I think it right to state my reasons, which may induce them to publish theirs, by which means truth will be elicited. As the earth is warmest in summer, being heated in a great measure by radiant heat proceeding from the sun, it is at that period that this heat is transmitted from the surrounding earth to the ice-house with the greatest velocity; and, as I stated before, the melting of the ice takes place in proportion to the difference in temperature between the stored ice and the surrounding medium. This difference is increased either by the earth which surrounds the ice-house becoming heated by the rays of the sun, or by the freezing point of the ice becoming lowered by a mixture of salt. It is, therefore, a desirable object to keep the surrounding earth as cool as possible. If the ice-house is surrounded and overtopped with large trees, their effects will be, first, to shield off the rays of the sun from the earth below; and secondly, the great surface of foliage exposed to the air and light will be continually giving off water in the form of vapour, which, in its transformation from water to vapour, will have taken up 950° of heat in a latent state more than the water contained, and expanded into about 1,690 times its former volume, having in effect destroyed 950° of sensible heat for all the watery juices given off (which is known to be very great in hot and dry weather). A coolness is therefore produced under the shade of large trees, which is not to be found in exposed situations; the proverbial "cool refreshing shade," &c., being produced, it may be presumed, not only from the shade of their foliage, but from the evaporation of water from their surfaces; but the still air beneath being an excellent non-conductor, the earth below will be found several degrees colder than that which is exposed. Again, the drip of trees from accumulated dew, &c., instead of being injurious, must be beneficial; because the surface of the soil will be partially wet, when that of exposed ground will be quite dry. The evaporation from the surface will produce a coldness below. But it may be said, that though the mere surface of the earth under large trees is often damp when exposed surfaces are dry, yet the earth below is much drier under and about the roots of large trees than anywhere else. This I consider is a great advantage; dry earth is a much better non-conductor of heat than wet; and I contend that the rain which falls where large trees are, is evaporated in a larger proportion from that surface than if it fell in an exposed situation. It appears to me, therefore, that the best of all places for an ice-house is the side of a hill, covered by large trees; three-fourths of the house being sunk beneath the surface of the ground, and the top being covered over with earth, and planted with Ivy.—*Thomas Corbett, Pencarrow.*

Fertilising Hautbois Strawberries.—Mr. Mackintosh, in his excellent work on Gardening, p. 368 (quoted from Keen), has stated that one male plant will fertilise ten females. It often occurs, however, that the male plants fail in flowering, and sometimes bloom after the females have set their fruit: a failure in the crop is a certain consequence. The Hautbois Strawberry is capable of being fertilised by other kinds; and it has been here proved, that the Russian Alpine is best adapted for this purpose. This kind flowers from May until the end of October. The Hautbois and Russian Alpine should be planted in well-prepared ground, in alternate rows, two feet apart. By these means a good crop of large well-flavoured Hautbois is obtained; and the Russian Alpine will continue to bear until destroyed by frost.—*George Annand, Strachur Park, Argyllshire.*

Rust on Grapes.—Much has been said concerning the cause of rust on Grapes, but the disease has not yet been satisfactorily accounted for. I allow that in thinning Grapes perspiration will cause the fruit to be rusty, particularly if a person's head should brush against the fruit, in which case the berries will not grow any larger, or, if they do, they will crack and become of a russet colour. But that is a different affair where a whole house is infested with this disease. When, in the month of March, I entered this situation ten years ago, I found, to my surprise, a large vinery 56 feet long, with four large Vines covering the whole roof, the stem of the largest being about 5 inches in diameter. They were trained on the spur system, and the rough bark had been allowed to remain on the old wood for several years. When the fruit made its appearance, the crop was very light, and, as it ripened, became of a grey russet colour, although the sort was the Black Hamburgh; the bunches had also an offensive smell. I could see nothing with the naked eye; but upon examining the bunches through a small microscope, I discovered millions of insects, which appeared to be a species of thrips of a yellowish colour. In the following spring I was determined to get rid of this pest: I therefore spurred the Vines as usual, that I might not lose the whole crop for one season; and I also trained up a young shoot as near as I could from the bottom of the house: I thus obtained good bearing-rods under every rafter the same season. At pruning-time I cut out every old branch, and left nothing but the rods: I also peeled the old bark from the stems as closely as possible without injury to them, when I found millions of embryo thrips in close contact with the innermost covering of the stem. I cleaned them all off, and dressed the Vines with a portion of clay, lime, soft soap, sulphur, and urine, made of the consistence of paint. The Vines are not forced, but treated as late Grapes; so that the eyes upon the rods have a better chance of breaking. I never suffer the rods to bear fruit more than one season; and in order to make them break regularly, I coil them up in a circle (but not so close as to prevent the eyes from having free liberty), and let them remain in that state until the shoots are at least a foot long, before I tie them up to the rafters. In this manner I obtain a bunch at nearly every eye. After pursuing the above treatment, I got rid of the rust, and have never had it since; my Grapes, also, colour well every season. Perhaps your Dublin correspondent's Vines are affected in a similar way.—*W. Bromley, Hammersmith.*

Yellow Savoy and Royal Victoria Raspberry.—I rarely can resist a new sort, either of seed or fruit; and, as you may suppose, get a good stock of rubbish. I, however, saw the Yellow Savoy mentioned in your Paper, and have grown it; and find it an excellent and most delicate vegetable. I believe it does not stand the winter. I may also mention a new late-bearing Raspberry (Royal Victoria), which I bought of Mr. Rogers, near Eaton-square; and this has turned out to be no cheat.—*Totty.*

Mushrooms.—I find at p. 821 that "C. I." has written a paragraph on the cause of failure in Mushrooms, in which he states that, in consequence of my not making a reply to your suggestion at p. 712 as to the cause of failure in my beds, he arrives at the conclusion that the wood of which the framework of my beds was formed was kyanised. Such was not the case, and therefore that could not be the cause of failure. Neither did it arise from the beds being exhausted, as the dilemma occurred immediately after the Mushrooms made their appearance. I have made four beds three successive times; from one of the first four I gathered two quarts of Mushrooms, but from the others I have never gathered one—consequently exhaustion could not be the cause of my failure. I have made up two beds again, and the spawn is working well; but what may be the result hereafter I am unable to say—hitherto it has been all in vain. I, like "C. I.," have been very strenuous in seeking for the origin of the evil, but I have not yet discovered it; and, like him, I should be greatly obliged if some of your able correspondents could inform me of the true cause of our failure.—*I. D.*——My first crop having failed in the same manner as mentioned at p. 712, I attributed it to the dry heat arising from the smoke flues, the temperature of the house having been kept regularly at 55 deg. Latterly I have placed vessels filled with water throughout the whole length of the flue, and raised the temperature to 65 deg., covering the beds also with hay; since which period the Mushrooms have done very well.—*John Vare, gardener, Leeswood.*

Tests of Nitrates and Ammonia.—Common salt (chloride of sodium) will decrepitate—that is, crackle, and fly off in fragments, on a hot iron; any nitrate will, on the contrary, sparkle and glow with intense ignition: hence their distinctive characteristics. Triturate the substance suspected or known to contain ammonia with a little caustic potash, and bring over it a feather dipped in strong and pure nitric or acetic acid, when a white vapour will appear, and moistened turmeric paper will be reddened.—*J. Murray.*

Experiment with Manures.—The following experiment was tried with guano, lime, soot, and salt, on a piece of garden ground that had borne four crops of Potatoes without any manure for the four previous years, and which was of course exhausted. The Potatoes put for the fifth crop were the Early Blues:—

17 rows, each 40 yards in length,	dressed with guano, produced	12 bushels of 90lbs. to the bushel.
17	with lime	9
17	soot	14
17	salt	14

Thus proving the salt and soot to be superior to guano, and the lime to be almost useless—except that the crop was cleaner-skinned than in the other instances. The manures were all applied previously to planting the Potatoes, and the soil was afterwards drawn up to them. The crop was tolerable, but in my opinion frame manure would have produced a greater increase. These dressings were of course put on with much less labour or expense than dung would have been, and in this respect they possess an advantage over it.—*F. B.*

To destroy the Onion Maggot.—I observed in a late Number of the *Gardeners' Chronicle* some account of the depredations committed by the Maggots of the Onion Fly (Anthomyia ceparum) during the last summer, and the means taken to prevent them. My gardener sowed Onions three times during the season, and the second crop was much infested by the larva of the above-mentioned insect. He succeeded however in checking its ravages by removing the diseased plants, and by applying the following mixture:—To 20 gallons of soft water he added, one peck of lime in lumps, half a peck of soot, two gallons of urine, one pound of soft soap, and one pound of flowers of sulphur. He used it in a fresh state, as soon as the lime was sufficiently settled to pass through the rose of a watering pan; and the Onion-bed was exempt from any further attacks. He applied the same mixture to his third crop of Onions, which, in consequence of it, continued perfectly free from any insect; and the Onions produced were not only numerous, but quite as large and good as those usually imported from Portugal. I have no doubt, therefore, of the efficacy of this application, not only in preventing the ravages of the fly, but in being an excellent manure for the production of fine and healthy Onions.—*Oswald Mosley, Rolleston Hall.*

To destroy Rats.—If your correspondent is not afraid of trouble or expense, he will find the following plan successful in destroying these vermin. He must procure an empty hogshead with a lid to it, upon which he must lay provisions every night for 8 or 10 days, that the rats may come there to feed, and give them every encouragement to go upon the lid. The night upon which he intends to take them, he must make a hole in the lid and fill the cask about one-third with water, placing a large stone in the centre to stand as an island about 4 inches above the water, as well as a live rat to seat himself upon the stone when the other rats arrive. The first one that enters will quarrel for the island, which will induce all the others to follow: so that by the following morning he may expect all those who have partaken of his bounty to be either killed (by fighting) or to be drowned. If a few small pieces of roast meat are placed on the lid with a small piece suspended from the hole, it will be an inducement for the rats to enter the tub. Mice may be taken in the same way on a smaller scale.—*J. Park, North Shields.*——I beg to inform you that Strychnia—or Barytes—or a powder patronised by the Bath and West of England Agricultural Society, and called "the Wiltshire Rat Powder," is, when mixed with fresh lard and spread upon bread or thin slices of undressed bacon, doubled and cut into small pieces, decidedly destructive to these vermin. There is also "the infallible Composition for destroying Rats and Mice," prepared by a person named Blades, of Nottingham, to which I and a neighbouring friend have recently considered ourselves much indebted.

—*Rusticus.*——The following is the method by which I got rid of those troublesome vermin :—Having procured a number of old corks, I burnt them to powder in a pan, so that I might not run the risk of losing them in the fire, and mixed with the powder thus formed some grease, such as is used by tanners. I then placed the mixture in an open dish in any places frequented at night by rats. On examination in the morning, after my first trial of this plan, I found that they had eaten the whole mess, and the effects were soon visible ; during several days following, I found numbers of them lying dead in different places, and I have not been troubled with them since. —*J. W. J.*

Mildness of the Season.—A few days since, Mr. Holding gathered some Mushrooms in one of his fields at Stodday, near Lancaster ; and there have been several other fine specimens found in the neighbourhood as much as four inches in diameter. There are also, in the garden of Mr. Foxcroft, of Ingleton, Polyanthuses and Primroses flowering in the open ground as freely as if it were July ; a rare occurrence in so cold a situation.—*Facile.*——A thrush's nest, with four eggs in it, was found in the shrubbery of the Rev. J. Bouverie, of Woolbeding, near Medhurst, on the 15th ult.—*A Novice.*——I send you the following list of plants now flowering in my garden :—

Auriculas
Polyanthuses
Chrysanthemums
Gentianellas
Daphne Cneorum
Hepáticas
Roses
Wallflowers
Mediterran. Heaths
Erýsimums
Pansies
Sisyrínchium
Tradescántias
Jonquils
Potentíllas
Stocks
Œnotheras
Christmas Rose
Dianthus latifólius
D. montanus
Nemóphilas
Anemones
Vincas
Saxifragas
Forget-me-not
Phloxes
Violets
Ampelopsis nítida, &c.

Yesterday I gathered ripe Raspberries.—*G. Imms, Woolwich, Dec.* 20.

Bees.—The "Despairing Bee-keeper" (p. 837) has been most unfortunate in her selection of books on Bee management. She cannot be said to have mismanaged her Bees, having strictly carried out the instructions given by Nutt and others, the "high-sounding theory" of whose system has "dwindled into a vague hypothesis." I can sympathise with your fair correspondent, as a parallel case came under my notice last season. The remedy is to be sought in getting rid of all the books mentioned (except the "Naturalist's Library"), and to purchase "Bevan's Honey-bee," in which will be found the experience of our ablest practical apiarians, and their advice may be acted upon without fear of failure. In operating upon bees, a little tobacco-smoke is necessary to subdue their fury ; and, as I presume your fair correspondent is not an adept with the pipe or cigar, she must solicit the assistance of some kind friend to puff a little smoke under the hive before lifting it up. I have seen Mr. Golding remove whole combs when the bees have been under the influence of tobacco-smoke ; and, until I saw him operate, I could scarcely believe that they could be disturbed with such perfect ease, without the operator being severely stung : indeed every comb in the hive is under Mr. Golding's control, and he can remove them at pleasure. The experiments of this gentleman are given in Dr. Bevan's interesting book. Immuring bees is imperfectly understood at present, and it ought not to be practised by an inexperienced hand ; I should therefore recommend your correspondent to remove her bees, which she has tied up, to their original situation in the open air.—*W. H., Reigate.*

A Problem in Cookery.—You need not have been in such a hurry, Mr. Editor, to thank your correspondents for their answers, although I am to be sure obliged to them for their good intentions ; for my son tells me that somehow they don't understand pie-making after all. "How, says he, "can it be the air that is swelled and forced out of the cup ? That won't anyhow do ; for if the air is forced out a little at a time, the juice would run into the cup a little at a time also, and by the time the air was all gone the cup would be full of juice." Now, I know the cup is empty all the time that the juice is boiling, and only fills when the pie begins to cool. Perhaps the natural philosophers will try again.—*An Old Lady.* [We fear our ancient friend is rather difficult to please. Since, however, she does not like air, she may approve of steam, and we submit the following for her and her son's consideration :] The cup inverted in the pie cannot prevent the syrup from boiling over. The boiling over of a liquid is occasioned by the elasticity and pressure of the air, and the expansion of steam. Globules of water, being converted into steam at the bottom of the vessel, rise upwards and create a vacuum, into which the air rushes, and this being expanded by heat, swells and expands the liquor : thus, by the creation of a vacuum, and the rush of the air by the atmospheric pressure to fill it, ebullition is continued. When the tea-cup is placed in the syrup, this rises but a little way up into it, the upper part being filled with air ; but as soon as steam is generated below the cup, this rises up into the cup, and, pressing down the air, forces it out from under the rim ; as soon as the heat declines, and steam is no longer generated, the steam within the cup is condensed, and a vacuum formed, and then the pressure of the atmosphere on the surface of the liquor around the cup forces it up and fills the vacuum—and there it remains until air is admitted to drive it out, which is done by lifting the cup. Let a stew-pan be supplied with milk and water of about an inch in depth, and a tumbler glass inverted in it ; place this over a fire, and observe the process : it will be found, that as soon as steam is generated it will rise in the glass, and force out the air, and also a great part of the water that was before in the glass : as long as it is kept in this state, the glass will appear empty ; but on the pan being removed from the fire, the steam will be condensed, and as it is so the interior will become a vacuum ; and to fill this, the pressure of the air will force up the liquid.—*J. Hayward, Lyme.*——Perhaps the following experiment may assist in answering without having the faculty of the four-and-twenty blackbirds. The way in which I make the experiment is this :—I get a small tin, here called a patty-pan, and used for baking mince-pies in, which I support with a strong wire, bent so as to bring it immediately over the flame of a candle with a large wick. I then fill it about half-full of water, and place a small inverted glass in it ; here I have the pie-dish, the juice, and the inverted cup (currants are scarce). For the paste or crust I take another larger glass and invert it over the small one, so as to rest on the patty-pan a little below the surface of the water. As the water warms, the air escapes from under the glasses in bubbles ; when the water boils, both the glasses are full of steam, and, without boiling very fast, the pressure of steam in the large glass (the crust) is sufficiently strong to force the water over the sides of the patty-pan (the pie-dish). I now take off the large glass, and open a small hole in the top of it (cut a hole in the crust), and replace it. The steam now escapes from the hole in the top, and the water boils fast, but not over. As yet there is not a drop of water in the small glass. I now withdraw the candle (take the pie out of the oven), and in an instant the small glass (the inverted cup) is full of water, and will remain so until I lift it up or replace the candle under it as before ; when the heat will soon force it out again. I think the inverted cup does harm when the air is escaping from beneath it, and at no time can it do any good except when the cup is sufficiently deep to support the crust.—*R. H. B.*—As it appears that the inverted cup has an important office to perform in supporting the crust, although it probably does not prevent the juice boiling over, I would suggest to the old lady the advantage of using a sort of egg-cup, made with both ends open, which, by allowing the air to escape at the top, would enable the juice to rise in it to the same level as it does in the rest of the dish ; and as its rising in the one would lower it in the other, the danger of boiling over would be rather lessened.—*X. Y.*

Bletting.—In P.P.'s quotation from the "Thresor de la Langue Françoyse," there appears to be a misprint. The true reading is, doubtless, "blette, espèce de poirée," not *pourrée.* This is not unimportant ; for the word is derived from the Latin blitum, (Greek βλιτον,) *beet ;* in French poirée, i. e., *white Beet.* It is found, in our own language, as the name of what is, I believe, called *Strawberry Spinach.* This, however, will be better known to yourself than to me. If your correspondent have an opportunity of consulting Roquefort's "Glossaire de la Langue Romane," he will find, s. v. Bléque, that in old French the word was spelt variously—"*blequc, blesse, blet, blette, blosse, blosson, blot,*" and signified *soft*, e. g., *poire blèque*, a soft Pear. It is probable that our English word *bloat*, which has been rather puzzling to Lexicographers, is descended from this stock, and indicated, originally, not *turgidity*, but *softness.* I am sorry that this derivation will disappoint the wish of P. P., that the word may have a Saxon descent. On the other hand, however, I can make him amends, and, I hope, give him pleasure by the information, that *blight*, although not related to it, *is* Anglo-Saxon, being, with a very slight change, the blæctha of our ancestors, and signifying *scurf, leprosy.* Its first application to vegetation would obviously be to designate diseases of the *exterior*, or *bark ;* and by an easy transition, it came to denote all diseases of which the cause was latent or unknown. The signification (which is gradually gaining ground among us) by which it is made equivalent to *blast* ought to be summarily ejected from every orthodox gardener's vocabulary, and the word *blast* (in the meaning of unbenign influence) substituted for it. Such things give copiousness and precision of speech to a people. The German word Blatt is nowise related to either of the above stocks. Its primary meaning is *level extension, spreading.* In this meaning it is found, with very little variation of shape, in all the European tongues, ancient and modern, and is, no doubt, a primæval form of language. It is the πλατυς and *latus* of the Greeks and Romans, and of English *blade, flat, plat*, &c. After this explanation, I hope that many of your readers who write flower-*plot*, will adopt the more perfect form flower-*plat.* Shakspeare writes *plot ;* but the learned Milton writes invariably *plat*, as you may see in many parts of his works. Permit me, while on the subject of etymology, to give a little support to the theory of a former correspondent of yours on the subject of the Seckel Pear. He appears not to have known that the simple word Seckel is found in German, for he states that he knows the compound Seckel-meister. Now the simplex signifies *pouch, bag*, &c., and is, in fact, an old form of the diminutive of *sack*—a sack. I think with him, that it is highly probable the name was given by some German colonist, who preserved the resemblance which the fruit of that tree has to a half-filled purse close drawn at the top. It is provoking to find that the Americans can really thrash the English who can thrash all the world. They introduce a Teutonic word into their language, and, lo ! we, who boast of our Germanic descent, do not know it ! They are making, indeed, according to the ingenious Flügel, (see his English Grammar for Germans,) more important additions to their "English Improved ;" for instance, that acute writer rather objects to such a phrase as the following : "Der stallion has über mein fence gesprungen und gedemmischt mein weizen." An American would class such a phrase, I suppose, under the syntactical chapter of "Going ahead." Does *P. P.* do well in employing the word *swerve* in a passive sense ? I have always considered it an *intransitive* verb, and, as such, unsusceptible of a truly passive signification.—*F.*

The Lily of the Field.—When noticing Lady Callcott's "Scripture Herbal," we pointed out the improbability of the Lily mentioned by our Saviour being the common white Lily of our gardens, as that lady in common with others has supposed. A friend has obliged us with the following communication from Dr. Bowring, which fortifies our opinion, and at the same time throws a new light upon the subject :—"I cannot describe to you with botanical accuracy the Lily of Palestine. I heard it called by the title of Lilia syriaca, and I imagine under this title its botanical characteristics may be hunted out. Its colour is a brilliant red, its size about half that of the common Tiger Lily. The white Lily I do not remember to have seen in any part of Syria. It was in April and May that I observed my flower, and it was most abundant in the district of Galilee, where it and the Rhododendra (which grow in rich abundance round the paths) most strongly excited my attention." Here then is quite a new reading suggested. It is clear that neither the White Lily, nor the Oporanthus luteus, nor Ixolírion, will answer to Dr. Bowring's description, which seems to point to the Chalcedonian or Scarlet Martagon Lily, formerly called the Lily of Byzantium, found from the Adriatic to the Levant, and which, with its scarlet turban-like flowers, is indeed a most stately and striking object.

Shakspeare.—My opinion on Shakspeare's fine passage

> "Pale Primroses,
> That die unmarried, ere they can behold
> Bright Phœbus in his strength,"

is the following :—Shakspeare's intimate knowledge of nature was not one of detail ; it was the general perception of genius—Homer-like, to whom also authors writing on Homeric natural history have ascribed knowledge, whilst he merely possessed perception—intuition. Shakspeare from a youth rambled much in the fields and forests, at the very beginning of spring, when Old-English frosts had ceased to harden the covers of the earth. Certainly, the Primrose greatly attracted his notice, as one of the first harbingers of spring. It is certain that the first blooms are always pale, or mostly so. Shakspeare, I am sure, did not examine whether such bear seed or not ; the endeavour would have been too detailed, the very idea unpoetical. The poet found them pale in the outset of spring ; he saw the same faded, decayed, afterwards : whilst others which blossomed at a more advanced period were not pale, the latter on account of having *beheld* "Phœbus in his strength." Of *him*, Shakspeare makes a heavenly bridegroom, reddening the cheeks of such as beheld him ; the others die "pale, unmarried." These, I am sure, were Shakspeare's grounds for speaking thus—provided genius be guided by grounds, and not by mere impulse—inspiration. Shakspeare think of the seeding of plants ! No such thing. The genius of the poet and that of a Linnæus are different indeed !—*A Foreigner.*

RIDDLE.

BY simple maids I'm call'd a queen,
Yet dwell in every rural scene,
To charm the village swain !
Each female courts me to her breast ;
But often when too fondly prest,
I leave a lingering pain.

Torn sometimes from my native shade,
I quit the peaceful moonlight glade,
In courts awhile to bloom ;
But blasted by the fatal air,
I pensive droop, and quickly share
Of worth the common doom.

Erewhile of faction made the slave,
My name for thousands of the brave
The funeral knell has rung ;
The stormy tales of ancient lore
Tell how I drench'd with British gore
The soil from whence I sprung.—*C. K.*

The Mistletoe.—Christmas and its symbols are always interesting, but more especially at the present season ; therefore the following suggestions and information from "Dennis's Landscape Gardener" appear to be appropriate :—"In situations unfavourable to plantations, any indigenous tree is too valuable to be improvidently destroyed, however defective in form, or uninteresting in appearance. Even a stiff Pollard, Oak, Elm, or Ash, should be carefully preserved ; and previously to the recovery of a tolerable head may anticipate mantling, by the contributory aid of parasitic shrubs, as Ivy or Mistletoe. The former, readily adhering to dead wood, may supply perennial ornament even to a scathed tree, struck by lightning, on an elevated spot. The latter attaches itself to trees of a smoother bark ; having acquired in Druidical times a sacred character by its adherence to the Oak. At present it is more frequently appendent to the Apple-tree, and merits cultivation in pleasure-grounds, not merely from perennial supply of decoration, but for the ulterior purpose of furnishing attractive food to the melodious nightingale; ants' eggs alone being unsatisfactory. Through absence of Mistletoe, this bird of passage never migrates from Somersetshire to the adjacent county of Devonshire." I need not remind those readers who are still enabled to maintain the Christmas customs and gambols of their ancestors, of the part the Mistletoe plays in those festivities. But, alas ! seldom now does

> "The Mistletoe hang in the castle hall,
> Or the Holly branch shine on the old Oak wall."

These ancient rites are rapidly falling into decay ; the Yule log and candle are fast sinking into oblivion ; and the old custom of regaling friends and neighbours on Christmas Eve with the jovial wassail bowl is now but of rare occurrence. Domestic difficulties too frequently restrain the generous impulses of the heart. Nevertheless, there are many trifling resources at the command of the least wealthy, by which they can alleviate the distress of the destitute and houseless. Who would miss an old garment or a morsel of food bestowed upon such objects? Doubtless most of your readers can spare something; and the smallest kindness in proportion to the means of him who gives, will have its ample reward in the double blessing of the donor and the receiver.—*C. K.*

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Dec. 10.—General meeting; the Duke of Richmond in the chair. After the report of the council had been read, the balance-sheet of general accounts for the first half of the year 1842 was read, when the Duke of Richmond informed the meeting that he was instructed to announce to the members the reference they were invited to make to the ledgers and account-books. It appeared that a further investment in the funds of 1,000*l.* had been made of capital, which amounted to 6,700*l.* stock, and that the current cash-balance in favour of the society was 1,600*l.*—Earl Spencer took occasion to revert to the only drawback on the otherwise good prospects of the society, namely, the amount of the arrears of subscriptions. He attributed their non-payment to several causes. Many were doubtful as to the mode of doing it, others put it off from day to day, while some were negligent in the intention of performing this duty. Such an accumulation would be fatal if allowed to go on to any extent, and accordingly it required, in different parts of the country, the exertions of all well-wishers of the society, by whose intervention more could be done than by severe measures. Mr. Pym considered there were two ways of getting in the subscriptions: first, by having collectors in different counties; and secondly, by the exertions of individual members in their own localities. Col. Challoner observed that according to the intention of the society 8,860*l.* ought to have been invested as permanent capital, instead of only 6,700*l.*, the actual stock; and he assigned as the cause of their inability to effect this, the employment of that surplus due to investment in the discharge of those current cash transactions which ought to be paid by the money now withheld in the shape of arrears. With unpaid arrears amounting to 5,000*l.* the Finance Committee felt it impossible to effect the desired investment. With regard to a collector to obtain these arrears, there were many points of great difficulty; but he agreed with Lord Spencer and Mr. Pym that, with individual exertion in each county, much might be done. Mr. Pusey, M.P., moved the thanks of the society to Dr. Playfair for having delivered two such able lectures before the members on two successive evenings of that week. The views which he had advanced were new and startling, and the subject was one which had but recently engaged his attention; but he had accomplished his task in a most able manner. Men of science were not, however, in a situation to dictate to practical men such changes in their plans as deviated far from their ordinary practice. The discussions of science might throw great light on the branches of agriculture immediately in connexion with their principles; and it was satisfactory to find that what we have been doing for centuries is the best thing, according to modern science, which we could have done. Mr. Divett, M.P., seconded the motion. He was of opinion that men of science singly could not in a great degree instruct the practical cultivator of the soil; but the two together might effect great improvements. He dwelt on the advantages to be derived from the theories and practices of foreign countries, especially of Germany, from which there was yet much to be learnt, both sound and practical. The Duke of Richmond then returned the thanks of the meeting to Dr. Playfair for his lectures.

LINNEAN SOCIETY.

Dec. 20.—E. Forster, Esq., in the chair. Mr. Hassall exhibited a specimen of a decayed Apple, on which were two species of Fungi which had been produced by inoculating a sound Apple with the spores of the Fungi. A paper was read from Mr. E. Quekett on the production of Ergot in Rye and other plants. He had sown two years successively seeds of Rye, and during germination had supplied them with water in which the sporidia from Ergot of Rye and Wheat had been diffused. In both years several of the plants of Rye produced Ergot. Barley and Wheat treated in the same manner did not produce ergotised grain. The author considered that these experiments, though not conclusive, rendered it most probable that the development of the Fungus which had been named *Ergotétia* was the cause of Ergot in plants, and that the sporules of this fungus were introduced with the sap. Mr. A. H. Hassall read a continuation of his paper on the development and reproduction of the Confervæ. The principal points examined were the reproductive process in the genera Vauchéria and Zygnéma; although the latter genus belonged to the Conjugata, the author had observed species in which reproductive globules were developed without conjugation. The remarks were illustrated by a series of beautiful drawings, made by the author. After the meeting, Mr. Hassall exhibited several species of Confervæ, by the aid of Mr. R. H. Solly's microscope. Mr. Powell also exhibited several preparations of organised structures, with one of his powerful microscopes. Mr. Solly exhibited specimens of Lycopódium lepidophyllum; and there were several dried ears of Rye on the table, illustrative of Mr. Quekett's remarks on Ergot.

MISCELLANEOUS.

Hints on Cider-making.—It is desirable that the Apples, after gathering, should be placed in open sheds, in layers not more than 10 or 12 inches deep; each sort should be kept separate; and the quality as well as ripeness of the fruit should be as similar as possible. Apples improve by keeping, so long as they continue to acquire a deeper shade of yellow; and when they cease to do so, grinding should immediately commence, and all green or decayed fruit should be carefully picked out. It is of the utmost importance that all the fruit should be of equal ripeness; it should also be ground at least three times to obtain the full flavour of the kernel and rind. In the water, which is necessary to make the fruit work well in the mill, three or four pounds of coarse sugar should be dissolved. Opinions differ as to whether or not the must should be taken immediately after grinding to the press; it certainly should never remain above 12 or 16 hours before being pressed; and we conceive, that if it is suffered to stand 10 or 12 hours, according to the warmth of the atmosphere, it will be better, stirring it often so as to expose the whole mass to the action of the air. After all the juice has been obtained by pressing, when the hairs are opened, throw the must into a tub, and let it be taken to pieces and rubbed with the hands into another tub; let this be again squeezed with all the power of the press, and the result will be a quantity of the strongest and finest liquid, which must be added to the previous runnings. When fermentation takes place after the liquor has been placed in the casks, all the attention of the cider-maker will be required. The period of its duration must depend upon local circumstances; sometimes it ought to last nine, sometimes ten, or even 16 days; but the best method is to taste it often, and when the cider has attained the requisite strength, then draw it off, and let the distance it has to run be as small as possible. Keep the perfectly clear liquor by itself, and pass the turbid part through bags. Wash the hogsheads destined to receive the clear cider with boiling water, so as to free them entirely from lees. When the casks are placed upon the trams, light a match (prepared by dipping strips of canvas 12 inches long and 2 inches broad into melted stone brimstone), and suspend it by an iron wire through the bung-hole in the centre of the casks, into which a few gallons of cider have first been put, and let it burn out. After an hour, the casks may be nearly filled with clear cider, and a tile may be placed upon the bung-hole. To fine the liquor, if not sufficiently clear, 1½oz. of the best isinglass, perfectly dissolved in a pailful of cider, should be allowed for each hogshead. It may be mixed by drawing 10 or 15 gallons from the cask to be fined, and, after adding the glazed liquor to it and beating it often to blend them, by returning the whole to the cask: the cider should then be stirred with a stick, so as to incorporate the whole together. It is stated that if 2 lbs. of lump sugar to each hogshead are dissolved in a few gallons of cider, and put into the cask, the sugar will answer as well as the isinglass; if so, it is certainly preferable. It is customary to rack off cider in the spring and to mix together the different sorts; when casks are attainable this is a good custom, but the hogsheads should always be well scalded previously, and the cider should never be racked except in very fine weather. The casks may then be stopped down. The above directions are intended only for the best ciders; and the same process will apply equally to perry. The following method of managing cider or perry when in a state of fermentation is also recommended:—Procure a piece of gas-piping, and bend it to the shape of the letter S. Place one end through the bung, but not so as to touch the liquor, and make it air-tight by pouring round it a little melted fat. Fill the curve at the other end of the tube with water, through which the gas will escape, while the exterior air will be prevented from getting into the cask.—*Abridged from the Hereford Journal.*

Food of Plants.—A remarkable discovery has been made by Messrs. Wiegmann and Polsdorff. It appears, from their researches, as reported in the last Number of the "Annals of Chemistry," that the roots of living plants disengage carbonic acid, and that this acid is capable of decomposing the silicates of the soil, which even resist the action of nitro-muriatic acid. This most curious discovery throws a new light upon the importance of carbonic acid to vegetation, and explains clearly what has been by no means evident, namely, the manner in which flinty substances prove beneficial to vegetation, and how minerals so hard as feldspar are made to contribute to the maintenance of plants. Plants of Tobacco, Oats, Barley, Clover &c., were grown in quartz-sand, which had been heated red-hot, and then digested for 16 hours in dilute nitro-muriatic acid. One would have thought that after such treatment the quartz could have contained nothing capable of sustaining vegetable life; nevertheless, the plants grew in it, and their ashes were found to contain potassa, lime, magnesia, and silicious earth, which had been obtained from the decomposition of the quartz-sand by the carbonic acid of the roots.

Model Mapping.—We have lately inspected, at the rooms of the Agricultural Society in Hanover Square, a specimen of this art applied to the surface of a farm, executed by Mr. Bailey Denton, the ingenious author of a treatise on the subject, formerly noticed by us, and of which we perceive a second edition has appeared. We would strongly recommend our readers who have the opportunity to visit it. They will find it one of the greatest aids to the drainage of land.

GARDEN MEMORANDA.

J. Allcard's, Esq., Stratford-green.—The Orchidaceous house has lately undergone several alterations, which have greatly improved its appearance. Its size has been increased by the addition of an adjoining house, which was formerly devoted to Cacti. This has been effected by taking down the partition wall, or rather by converting the wall into a series of arches, encased with moss; in this Lycopódiums, Ferns, and Orchidaceous plants are growing, which impart to it an elegant and lively appearance. In the centre of the house is a small aquarium, in which, supported upon bricks, are placed two large specimens of Pháius grandifólius, in pots, both plants flowering in great perfection. This basin is surrounded by rockwork, intended for the growth of Ferns. The greater part of the Orchidaceous plants, which are suspended from the roof, are seated upon square blocks of the interwoven roots of Osmunda regalis, a native Fern found growing in great luxuriance in a wood a few miles distant: most of the plants appear to thrive well under this treatment. Amongst those in bloom are, Epidendrum Skinneri, of a bright purple colour, slightly marked with orange upon the labellum, and valuable for the length of time which it continues in bloom; Fernandézia acuta, covered with its delicate light yellow blossoms; Líparis cylindrostáchya, its slender green and yellow spikes hanging gracefully around, and diffusing an agreeable odour; with Maxillária picta, M. pállida, the sweet scented Epidendrum nocturnum, and various others. Houlletia Brocklehurstiana, Pháius Wallíchii, and Maxillária Steélii also promise an abundant bloom. The collection of Ferns is very extensive: one house is entirely devoted to their cultivation. At this dull season of the year, their luxuriant habit and great diversity of form present a pleasing contrast to the sombre and desolate appearance of the leafless trees without. The greenhouse is gay with Chrysánthemums, Caméllias, Chinese Primroses, &c.; and in a mass of rockwork in the centre is a large plant of Cibótium Billardieri, which grows vigorously in this temperate atmosphere, while in the neighbouring stove it can scarcely be kept alive. Adjoining the flower-garden, and built on the ridge and furrow system, are two vineries, which are found to answer perfectly. One is at present filled with Pelargóniums and Ericas: beneath the stage is a Mushroom-bed, which is bearing abundantly—the greatest enemy to their growth being the drip from the pots above; this is, however, in part remedied by sparing watering. On the right of these houses, and built upon the same principle, is a range of pits, which appear to possess several advantages over those usually erected. As we have never seen anything of the kind elsewhere, we shall give a short description of them. Each ridge is formed of two lights resting on the top sides, where they open, against each other, and secured on the lower sides by hinges; so that when it is necessary to give air, or to work in the interior of the pit, they can be tilted to any required height, or be thrown back, like the leaves of a book, against the ridges on either side. In wet weather these top-lights can be kept quite closed, as abundance of air can be admitted, both at the back and front of the pit, by means of triangular ventilators situated immediately under each ridge. All the water which falls upon the pit is carried off into gutters formed in the rafters, upon which the lower sides of the ridges rest: these gutters communicate with a wooden spout in front, which conveys the water to a neighbouring cistern. This pit 40 feet long is heated by hot-water pipes from the same boiler which warms the vineries, their length being 60 feet. In summer the pit is used for Cucumbers and Melons, for the early growth of which it appears admirably adapted, as the plants receive the rays of the sun almost at right angles with the glass, both earlier in the forenoon and later in the afternoon than in pits of the ordinary construction. In winter it is converted, by means of a movable stage, into an hybernatory for Verbenas, Calceolárias, and other border plants. To take off the heavy appearance of the back wall of the pit, which runs parallel with the walk, a small border has been raised to within a foot and a half of its top: this is filled with a collection of Alpine plants, which are protected from severe frost and rains by painted canvas shutters. In order to give a better idea of this novel construction than can be conveyed by any written description, Mr. Croucher, the gardener, has promised to favour us with a plan of it, which will appear in a future Number of the *Chronicle.*—*R. A. Dec.* 12.

Reviews.

Christmas Presents.—Two books well suited for this purpose are before us, namely, *Bertha's Journal*, and *Howitt's Rural Life in Germany.*

The first is the 5th edition of a work, said to be the journal in England of a young person who had passed her childhood in Brazil, and who visited this country on a visit to her relatives. It consists of nearly 500 pages of closely-printed matter, relating very much to Natural History; and it abounds in gossip, both entertaining and useful to young people.

Howitt's Rural and Domestic Life in Germany is a very different book, ornamented with woodcuts of scenery and costume, and devoted to the description of such points in their character and habits, as give Germans, in the author's eyes, their most striking peculiarities. We like the work much; abounding in useful and instructive information to those who know Germany only by description, extremely entertaining, and full of good reading, it is just the book for a Christmas fireside. We all know how much richer than England is Germany in beautiful wild flowers; and here is a passage that would almost tempt us to go in search of the reality.

> "About four miles from Stuttgard we passed the royal park, called the Solitude, with a fence of boards of a very un-English look. We could not sufficiently enjoy, in the fineness of the weather, the wide clear prospects, the country full of busy happy-looking people gathering their corn; and not less, the profusion of beautiful wild flowers which grew in the openings of the unfenced woods and by the road-side. They were such as are common to our gardens, but not to our fields. Amongst them were some splendid specimens of Salvias, and others that we did not know. The wild Pinks were profusely abundant and beautiful; many of them with their intense crimson, marking the turf between the Beech woods with their vivid bloom, and others, a foot or more in height, of fringed lilac, and of the most delicious odour. The charm of all woods lying open as you travel is inexpressible. We descended at every slight ascent in the roads from the carriage, strolled sometimes through the woods, sometimes along the grassy margins of the road, and at one grasp could take up a whole sheaf of flowers, that would have been the pride of our gardens, and that to the great amusement of our bluff kutcher, who had been accustomed to see them on the road-side all his life."

The account of German domestic life reminds us greatly of what even we faintly remember that of England to have been, before the heads of country folk were turned by high prices and bad fashions. The ladies are described as occupying themselves with household affairs in the early part of the day, and with sewing or knitting afterwards. Cookery seems to be their grand employment. Mr. Howitt tells us that "ladies of rank and fortune are still plentiful who spend their mornings in the kitchen and are up to the elbows in flour, as busy compounding salads and puddings as ever an old alchemist was in preparing *his* elixir of life;" and we are even assured that there are those "who have been for more than a year regular attendants of the kitchen of some great hotel, in order practically to learn all the sublime mysteries of cooking!"

The manner in which young people pass their winter evenings is thus described:—

> "The young people on these occasions amuse themselves also with a vast variety of games which in England would be thought to be adapted rather to children than to grown-up people, but which, however, occasion plenty of mirth, and indicate a state of society much more homely and ready to be pleased than ours. Among these stand eminent in favour, "Die blinde Kuh," the blind cow, another name for blind-man's buff. They have various other games of forfeits. They write romances; each person furnishing a sentence without knowing what is written before him, so as to produce the most ludicrous medley. They put down the names of their acquaintances, each adding, without knowing to what name it is attached, a character, a circumstance, and what the world thinks of it; which, when read aloud and in connexion, produces, through the oddest combinations, great merriment. They write questions and answers on separate strips of paper, which being hustled together, and then read, the answers falling to the questions as it may happen, are generally very amusing. They have various card-plays of the same nature, chief amongst which stands Black Peter, which consists in a pack of cards being equally divided amongst the company, and those which are of equal numbers being thrown out. He who is first out becomes the holder of a burnt cork, with which he makes a streak on the face of him or her who is found at last with Black Peter or the Knave of Clubs. The dislike of receiving this mark, especially by the ladies, and the different whims of making mustachios, whiskers, strokes down the nose, and so on, by the inflictor, produces all the fun. They have a game also with flour, equally popular. The young people sit round a small table, on which a basinful of flour, tolerably hard pressed, is turned out on a plate, and on its top is laid a ring. Each person cuts a slice from the flour with a knife, and he or she at whose cut the centre flour falls, has to take the ring out of it with his or her mouth. This generally gives a very mealy visage and much laughter."

Happy indeed are the people where whole companies can amuse themselves with such simple usages.

The manner of drying Clover crops in Bavaria is thus described:—

> "A singular feature in the scene was presented by their mode of drying their heavy crops of Clover, of Linseed, and even of

Oats. The crops were rank, the ground moist, and the process of drying not a very rapid one for anything lying on the earth. Instead, therefore, as with us, of these crops being left on the ground and repeatedly turned till dry, they were hung on tall poles with pegs in them, so that the air could constantly blow through them. By this plan they are much sooner dry, without any further labour; and there is also this attendant advantage, that the seed is not knocked out. This plan might be advantageously introduced into many parts of our own country, especially into such counties as Lincoln, Cambridge, and Huntingdon, where you may see the heavy crops of Grass and Clover lie on the ground ten days or more, to wither before they are in any manner moved. In the north of Scotland, the Scotch islands, and in Ireland, I imagine this mode would be of great service in the midst of a moist atmosphere, except that in these places wood is often scarcely to be found. These poles, thus clothed, have a very odd effect, particularly in the dusk of evening. As they stand clad in shaggy grass or corn, they present to the eye of fancy trains of giants, old hermits, or pilgrims of a rude and woodland age, marching on their way. Some of the poles have pegs artificially driven into them, others are young Spruce Fir-trees, or the tops of larger ones, with their boughs, which naturally grow very horizontally and circularly, cut off at the lower end, at about 18 inches in total width, and gradually tapering upwards."

We wish we had room for further extracts; what we have given will, however, serve to convey a just idea of the character of this very entertaining volume.

ANOTHER book of the same healthy class is a new edition of *White's Natural History of Selborne*, by the Rev. L. Jenyns. (Van Voorst.) So long as the press continues to bring forth works of this sort, we shall not be alarmed at the influence of the sentimental novels and fetid romances which find ready readers among the vitiated part of the community; for they touch the sound parts of the mind of society, just as the Jack Sheppard class encourages its purulency. White's Selborne has for many years been a classical book. Written in a sequestered but charming country village, shut up by impassable rocky lanes in a remote nook of Hampshire, it tells of nothing but birds and insects, and plants, and other living things; but it does this in so natural and unaffected a spirit, that it is impossible for any one wise enough to love a quiet country life and to think of something beyond fox-hunting, not to sympathise with good old Gilbert in his inquiries, his doubts, and his little discoveries. People may say, indeed, that the subjects of his investigation are unimportant; that it matters little whether there are three species of Willow Wren, or a dozen; and that man has something better to do than to busy himself about such trifles. We would, however, suggest to all such persons that this sort of inquiry is directed to the works of God; and, in all humility, we submit that it is of more real value than the clearest details of the crimes and follies of man. Everybody knows that the History of Selborne has gone through many editions; no one, however, has, to our mind, so fully entered into the feelings of the author as Mr. Jenyns, the editor of the impression now before us. His notes are judicious and apposite, neither too many nor too few; the woodcuts introduced in illustration are generally beautiful, while the execution of the typography renders the volume in that respect all that could be desired. How much it is to be regretted that the example Mr. White hoped to set to parochial clergy should have been so little followed, that we cannot lay our hands upon even one book that can be placed as a companion to this History of Selborne!

CALENDAR OF OPERATIONS *for the ensuing week.*

WE cannot do better than direct the attention of Gardeners to the excellent observations contained in the leading article of the last Number, which apply with equal force to gardens and plantations, and all Agricultural land that usually comes under a Gardener's charge. We mention this here, because there are places where it is customary to discharge part of the labourers in the depth of winter—a season when there is no chance of their getting work elsewhere; although such men could be employed, with advantage to the employer as well as to themselves, in such improvements as are pointed out in the article alluded to. In addition to such out-door work, many utensils used in gardens might also be manufactured by the men in wet weather; for example, rough baskets for holding weeds, vegetables, &c.; wicker-work protectors for tender plants; open wicker-work, to defend young trees from hares; wire trellises, for twining plants; straw mats, and many other necessary articles, which would cost a considerable sum if purchased.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Fruit that came up in autumn and is now swelling, will need every assistance to induce it to attain a creditable size. Too low a temperature through the winter, by checking the progress of the fruit, generally causes it to ripen prematurely in spring, and consequently to be dry and tasteless. If practicable, these should be kept from 5 to 10 deg. warmer than plants which are not in fruit, with a more humid atmosphere; the fruit and the leaves should also be sprinkled with tepid water occasionally. Twist the hearts out of all suckers.

VINERY.—When the buds begin to swell, the plants will bear stronger excitement; therefore give less air in the day, the night temperature remaining the same. A moist atmosphere must be maintained, and the daily syringing not omitted till all the buds have broken. As the stems of the Vines will shortly draw upon the roots for food, these should be placed in favourable circumstances for acting with effect; if possible, therefore, let the outside border be covered with a mass of dung and leaves of sufficient thickness to maintain a steady, gentle heat. Or, in case the Vines root inside of the house, care must be taken that the border is in a proper state with regard to moisture.

PEACH-HOUSE.—From the extraordinary mildness of the season, artificial heat has seldom been required in order to produce a temperature of 50°, which is several degrees higher than we should have advised so soon after the commencement of forcing, had the weather been cold. Continue to admit air liberally on fine days, and to dew the trees with milk-warm water till the blossoms have begun to expand. A covering of warm dung would be very beneficial to the roots, if they are outside of the house.

FIG-HOUSE.—In severe weather sufficient fire must be applied to exclude frost; this house, therefore, is a suitable place to [illegible], Fig, or Cherry trees in pots, which are intended to [illegible] into heat in the beginning of the year. In bad weather [illegible] can be top-dressed or repotted, as may be necessary.

[illegible]ROOM-HOUSE.—Maintain a humid atmosphere in preference to watering the beds. See that out-door beds are well protected by dry litter and mats at the approach of frosty weather.

[illegible]BERS.—Young plants on dung-beds suffer sometimes from damp; to guard against this, keep up a sufficient heat in the bed to allow of air being given daily to dry the plants. The temperature in the frame ought never to be below 70° for any length of time. To prevent the escape of heat from the bed, thatch its sides with long straw. A bottle, or some other closed vessel, filled with water should always be kept in the frame, ready for watering the plants when they require it; the soil must also be previously warmed before they are potted off from the seed-pans, or shifted into larger pots.

ASPARAGUS might be kept a week or longer after cutting, by covering it with dry sand. The first-made bed, when cleared of the roots, might have the frame nearly filled with warm dung, and it will do for a crop of Radishes or Carrots.

KIDNEY BEANS.—Thin the young plants as soon as the first rough leaves are unfolded, and add a little light soil round their stems.

Out-door Department.

Young crops of Lettuce, Onions, Spinach, &c., should be lightly hoed amongst on a fine day, to destroy weeds. Remove dead leaves from Brussels Sprouts and Broccoli: this last might even yet be laid down if the plants are large and succulent. See to Shallots and Garlic, which are apt to be drawn out of light soils by worms. When dry, tie up Endive; or, which is better, cover each plant with an inverted flower-pan. A sufficient stock of Succory should be housed before severe frost sets in.

ORCHARD.—Proceed with the pruning and nailing of wall-trees when the weather is favourable for these operations. At other times, dig the alleys; manure and dig between rows of Strawberries, observing to let the soil lie close about the plants; and finish digging among the smaller fruit-trees.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Turn over and mix the different soils in the shed, and get everything ready for potting. Prepare different kinds of broken pots for drainage. Make and paint labels to replace those which are old and decayed. Train carefully climbing plants which are beginning to grow, and get such work generally forward as can be done at this season, for the spring will bring sufficient work of its own.

GREENHOUSE AND CONSERVATORY.—Remove declining Chrysánthemums, and supply their places with flowering plants from the forcing-pit. After flowering, the Chrysánthemums might be plunged in some sheltered spot out of doors; if wintered under glass, the shoots are apt to get too forward before the time arrives for propagating them. The leaves of large plants in the Conservatory should be freed from dust and stains by occasional syringings. Prune and tie Passifloras to the rafters, when they have discontinued blooming. Let the more hardy Greenhouse plants have all the air possible, lest the mild weather should cause them to grow too fast. Continue to train the various kinds of Tropæ'olums to their trellises as they advance in growth.

PITS AND FRAMES.—Observe that Caméllias in the forcing-pit are properly supplied with water, or their advancing buds will probably fall off. Syringing may sometimes be necessary to these and other forced shrubs, in case the atmosphere of the house they are in is not rather humid. Mignonette in pots must be very sparingly watered. If annuals for flowering in pots are wanted to make large specimens, they must be repotted when necessary, and not suffered to become pot-bound; they should also be set in an airy place near the glass. See that choice Carnations do not suffer from damp, which is more injurious to them than cold.

Out-door Department.

If the continued mild weather should bring up choice Tulips, Hyacinths, &c., before their time, it will be necessary to defend them from snow and frost. For this and similar purposes, a light frame-work of wood, thatched with straw, would be useful, as it could be lifted on and off as required without much trouble. Two or three inches of sand spread over the beds during severe frost will be an efficient protection in case the foliage does not appear above the surface of the ground. Valuable vases or statues should either be covered or removed to some building during winter. As worm-casts still make the lawns unsightly, they should be swept sometimes. Finish the planting of shrubs on dry land.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—The season is still favourable for transplanting young trees. Young evergreens will be benefited by removal, which will stop their growth, and thereby make them better able to resist cold.

FOREST AND COPPICE WOODS.—Thin young plantations, if no planting, draining, or other ground-work remains to be done. This is a better time than the spring for the removal of large quicksets, to form an immediate fence round new plantations. Dry-fencing, such as walls and palings, can better be done in spring.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Dec. 22, 1842, as observed at the Horticultural Garden, Chiswick.

Dec.		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	16	30.038	29.952	55	48	51.5	S.W.	.06
Saturday	17	30.170	29.882	51	31	41.0	S.W.

Sat.	31	44.0	34.1	39.0	4	0.24	—	3	—	1	3	4	3	2

The highest temperature during the above period occurred on the 30th, in 1833—thermometer 56°; and the lowest on the 25th, in 1830—thermometer 12°. The night of the 25th of December averages the lowest temperature of any night in the whole year.

REPORT ON COVENT GARDEN MARKET,

For the Week ending Dec. 23, 1842.

[The Half-sieve contains . . .	3½ imperial gallons.		
The Sieve	7	,,	,,
The Bushel Sieve	10½	,,	,,
The Bushel Basket	1 imperial bushel.		
Punnets for Seakale are . . .	7¾ in. wide and	2 in. deep.	
,, Radishes	8 ,,	2	,,
,, Mushrooms . . .	7 ,,	2	,,
,, Salad	5 ,,	2	,,]

THE fineness of the weather during the past week has rendered the supplies larger than in the preceding one; otherwise little difference has occurred, either in the prices or in the demand. *Fruit.*—Some handsome Pines are offered, principally Montserrats and Queens, with a few Envilles, from 3s. to 5s. per lb. Hot-house Grapes are of better quality than they have been for several previous weeks, and fetch from 4s. to 7s. per lb. Apples and Pears remain the same as in our last report. *Vegetables.*—Asparagus still continues small, and far from plentiful: the best is selling from 8s. to 10s. per 100. Seakale is excellent, and fetches from 1s. 9d. to 2s. 6d. per punnet. New Autumn Potatoes continue to be well supplied, from 6d. to 9d. per lb. A few bundles of Rhubarb are offered, from 1s. 3d. to 1s. 9d. each, but they do not appear to be in much request. In consequence of the mildness of the weather, Broccoli and Cauliflowers may be obtained of much finer quality than is usually to be expected at this season of the year. Lettuces, Endive, Celery, and all kinds of salading are abundant. Unusually good Mushrooms are plentiful, from 6d. to 1s. per pottle. *Flowers.*—The collections of cut flowers exhibit a great variety, and comprise Lucúlia gratíssima, Poinséttia pulchérrima, Bignónia venusta, Pyrus japónica, Azáleas, Rhododendrons, Caméllias, Gardénias, a great variety of Heaths, Narcissuses, Tulips, Mignonette, &c. We also observed specimens of the Arbutus Unedo, or Strawberry-tree, in fruit, Mistletoe, Holly, and all kinds of Christmas decorations, are abundantly supplied.

PRICES, SATURDAY, Dec. 24, 1842.—FRUITS:—

Pine Apple, per lb. 3s to 5s
Grapes, Hothouse, per lb. 4s to 7s
— Spanish, 9d to 1s
— Portugal, 1s to 1s 6d
Apples, dessert, per bush., 2s 6d to 7s
— Kitchen, 2s to 6s
Pears, dessert, per hf. sieve, 2s to 8s
Pomegranates, per doz., 3s
Medlars, per doz. 9d
Oranges, per doz., 9d to 2s
— per 100, 5s to 16s
— bitter, per 100, 12s

Lemons, per doz. 1s to 2s
— per 100, 6s to 14s
Almonds, per peck, 7s
Sweet Almonds, per pound, 3s
Chesnuts, per peck, 3s to 7s
Walnuts, per bush., 12s to 16s
Filberts, English, per 100 lbs. 60s to 65s
Cob Nuts, per 100lbs., 70s to 80s
Nuts, per bushel—
— Brazil, 16s to 20s
— Spanish, 18s to 20s
— Barcelona, 24s

VEGETABLES.

Savoys, per doz. 6d to 1s
Cabbage, per doz. 9d to 1s
— plants, per doz. 1s 6d to 2s 6d
— Red, for pickling, 1s 6d to 5s
Brussels Sprouts, per hf.-sv. 1s 3d to 2s
Broccoli, White, per bunch, 10d to 1s 6d
— Purple, 8d to 1s
Cauliflowers, per doz., 1s to 4s
Potatoes, per ton, 40s to 75s
— per cwt. 2s to 4s
— per bushel, 1s 6d to 2s
— Kidney, per bu., 1s 6d to 2s 6d
— Scotch, per bu., 1s 6d
— New Autumn, per lb., 6d to 9d
Jerusalem Artichokes, per half-sieve, 9d to 1s 6d
Turnips, per doz. bun., 1s to 2s 6d
Red Beet, per dozen, 9d to 1s
Scorzonera, per bundle, 1s 3d to 1s 6d
Salsafy, per bundle, 1s 3d to 1s 6d
Cardoons, each, 1s 6d to 2s
Horse Radish, per bundle, 1s 6d to 4s 6d
Radish, per doz. hands (24 to 30 each) 9d to 1s
— Turnip, p. doz. bch., 1s to 2s 6d
Carrots, per doz. bun., 3s to 5s

Parsneps, per dozen, 9d to 1s
Spinach, per sieve, 1s to 1s 6d
Leeks, per doz. bun., 1s 6d to 2s
Onions, per bushel, 4s to 6s
— Pickling, per hf.-sv., 3s to 4s
— Green, p. doz. bun. 3s to 4s
— Spanish, per doz. 2s to 6s
Garlic, per lb. 6d to 8d
Shallots, per lb., 1s
Asparagus, per 100, 8s to 10s
— Second or Middling, 3s to 5s
Sea-kale, per punnet, 1s 9d to 2s 6d
Lettuce, Cabbage, p. sc., 6d to 9d
— Cos, 9d to 1s
Endive, per score, 9d to 1s 6d
Celery, p. bd., (12 to 15) 6d to 1s 6d
Rhubarb Stalks, per bdle, 1s 3d to 1s 9d
Small Salads, per punnet, 2d to 3d
Watercress, per doz. sm. bun. 4d to 6d
Tarragon, per doz. bun., 2s to 3s
Sage, per doz. bunches, 1s 6d to 2s
Mint, per doz. bunches, 2s
Chilies, ripe, per 100, 1s 6d to 2s
Mushrooms, per pottle, 6d to 1s
Truffles, per lb., 2s to 2s 6d

Notices to Correspondents.

TO CORRESPONDENTS.—We trust that those whose communications do not appear to-day will not suppose themselves neglected. Many papers are in type waiting for room, and very many more are marked for printing.†

MANURES.—*M. W. K. & I. K. S.*—The reason why those who employ guano-water for manure use it strong at first and weaker afterwards, is probably because, after the first application, a minute amount of the fertilising principle is better than more. The mixing guano with water is to separate all the soluble matter from the solid materials of which it consists. †——*E. H. T.*—We cannot advise you to water your plants with guano in a liquid state, unless you can fully expose them to light. In that case use it in very small quantities, as directed at p. 840.†——*J. R. W.*—We prefer sulphuric acid to any other agent for the purpose of fixing ammonia. Mix it with 5 or 6 times its bulk of water, and apply it slowly and gradually, till no fumes are given off, by a rag dipped in muriatic acid when held near it.†——*J. H.*—The black treacly liquid that is running from your dunghill contains all the best part of your manure. Can you not keep pouring it over the heap, until it is all soaked up? If it will continue to run from it, by all means catch it in a tank of some kind. It is of the best possible quality for Grass land, the kitchen garden, and arable land. Do not use it, however, unless in small quantities, for orchard trees, or you will make them run to wood instead of bearing fruit. The effect of the black liquid on your Grass will surprise you, if it is applied now, or soon.†——*Calx.*—The usual way of preparing salt and lime is to mix 1 bushel of the latter with ½ a bushel of the former in a dry state, and to allow them to remain for three months before use. The mixture would be benefited by the addition of an equal quantity of either light loam or coal ashes; the latter, however, are preferable if you can procure them. Some persons recommend the lime to be slacked with sea-water, which will produce nearly the same effect; 32 bushels of lime being sufficient to apply per acre. ‡

CIDER REFUSE.—*Urban* states that pressed Apples, the refuse of the cider-makers, are thrown away in cider counties as useless, and that the farmers do not mix them with manure, believing that their addition would spoil it. It certainly is not evident why this substance should spoil manure; although its addition might not increase its value, we should not expect that it could injure it. It would be worth while to try the effect of mixing cider refuse with putrid urine, or similar ammoniacal liquids; it is probable that the acid in pressed Apples would be useful in fixing ammonia, whilst the remainder might form more serviceable manure when the acids it contained were neutralised. *E.*

CARNATION MOULD.—*P. H.*—Your soil for Carnations, which consists of old turf, well-decayed hotbed dung, and leaf-mould, is very good; it may be improved by mixing with it some sharp sand or grit, and a little quicklime to destroy the wireworm. ‡

DIGGING.—*D. W. S.*—It is not too late to double-dig land, whilst the weather remains favourable; avoiding working it in a wet state. Strong three-pronged forks about seven inches wide, by 13 or 14 in. deep, will be found more effective than spades, particularly if the land is at all clayey or stiff. The bottom or under spit should not be brought to the top, unless the latter is exhausted, and the soil underneath be of better quality; bringing the bottom spit to the top would very much increase the amount of labour, and be useless unless under those circumstances; the upper spit had much better be ridged, as it will enable the seed to be got in under better auspices, and will facilitate the eradication of the Tussilago, for the destruction of which constant hoeings during the summer must be resorted to, after having forked out as much as possible in the digging. We should say land could not be double-dug for two pounds per acre—it will take a good labourer about 24 days to dig an acre of light ground well, and in strong land one-fourth longer time; for double-digging, one-half more time may be added; by this the cost may be easily estimated according to the rate of wages given. If you find the land wet, drain it by all means; although double-digging would probably remedy this evil in part, by allowing the wet to pass deeper. *P.*

BUILDING HOTHOUSES.—*A Constant Reader.*—We certainly do not advise you to build a Greenhouse and Vinery after the plan which you have sent us. Independently of the unnecessary expense which the covered glass to match with the rafters would occasion, we do not see where you would be able to obtain a sufficient ventilation, one of the chief points which should be attended to in erecting a Greenhouse. As Vines under proper treatment will flourish in a house of almost any shape, and as you will require the two buildings to correspond with each other, it will be better to have them of that form which is best adapted for the growth of Greenhouse plants. A house of this kind should be about 5 feet high in front, having upright movable windows sliding horizontally, with a flat roof sloping at an angle of about 35 degrees, and having sliding lights at top. This will give you a perfect command of ventilation. Both houses may be heated by one of Rogers's Improved Conical Boilers (the second size will be large enough), and by a single 4-inch iron pipe passing and returning along the front. This will be sufficient, if you do not intend the Vinery for forcing: if the latter is your object, the power of heating must be doubled. In that case it will also be advisable to plant the Vines inside the house; if not, it will be better to let the roots range in a border outside. For building houses of this description we prefer wood to iron.‡

Covering for Pits.—*A Subscriber ab initio.*—If, instead of allowing the space of 2 inches between the painted canvas covering and the surface of the glass to remain empty, you were to fill it with hay or straw, packed *loosely*, you would effect a great saving of heat. This might be easily done by securing the straw, or whatever material you may use, between the framework of the covering by means of lathes or tar rope.‡

Heating.—*F. H. S.*—For heating such a small house as you describe, 12 ft. long and 10 ft. wide, a Vesta stove will be quite sufficient; but it must be provided with a pan at top for evaporating water. ‡

Vines.—*Anon.*—We do not recommend gas-water as a manure for the roots of Vines. It will probably make them run too much to wood.†——*L. B.*—No benefit can be derived by watering Vines or any other tree close to the base of the stem, unless from the slope of the border the water is carried away to the extremity of the roots. The best plan is to observe how far the branches spread, and to water most freely at that distance from the stem.‡

Vine-border.—*M. W. K.*—If there is a good fall *from* the house at the bottom of your Vine-border, you have done right in substituting slates for brick-rubbish; but if not, you have aggravated the evil, instead of remedying it, because the slates will prevent the water from draining away. Our principal object in recommending you to place broken bricks at the bottom of the border was, that a thorough drainage might be effected. ‡

Cydónia japónica.—*A. A.*—We much question whether this shrub would bloom with any certainty if planted against a wall with a north aspect. To flower it in perfection, the plant should either be trained against a south wall, or planted in an open situation fully exposed to the sun's influence.‡

Himalayan Coniferæ.—*A Novice.*—Seeds of the Deodar and other Himalayan Coniferæ may be procured by any party who will pay the cost of their carriage by the Overland mail, upon application to Dr. Falconer, superintendant of the Hon. East India Company's Botanic Garden at Saharunpoor.‡

Early Flowers.—*L. H.*, whose employer returns into the country next year in May, instead of September, as has usually been the case, and who wishes to have his flower-garden gay against her return, must depend almost entirely upon such plants as Tulips, Anemones, Ranunculuses, bulbous-rooted Irises, and Pansies. These, if planted at all, should be put in while this open weather continues, and should be kept sheltered from snow or rain during winter. If bulbs of Tigrídia pavónia were forwarded in a frame, they would also bloom early when planted out. Rhododendrons, Azáleas, and plants of Erica cárnea, would likewise assist in making a gay appearance.‡

Plants for shady Banks.—*F. H. S.*—Periwinkle will thrive well under the shade and drip of trees; so also will Hypéricum calycinum, the Tree Box, and common Ivy, not Ground Ivy. ‡

Camellias.—*A. A.*—These plants should be repotted, soon after they have bloomed, into a mixture of turfy loam and peat; they should then be placed in a moderately warm and moist atmosphere, which will cause them to make vigorous shoots. As soon as the blossom-buds for the succeeding year can be discerned about the size of a pea upon the ends of the young woods, the plants should be withdrawn to a cooler temperature. If the pots are well drained, Caméllias may be freely watered during the period of blooming; they will also require a liberal supply while they are making their annual growth; at other times water should be administered with moderation.‡

Goldfussia.—*M. D. T.*—Since you have this plant in such good health, it can hardly fail to flower, if it is kept enough exposed to light. It is quite a stove species, and requires a good deal of bottom-heat. It will never thrive in a cool conservatory with a winter temperature of 40°.†

Blue Hydrangeas.—*P. H.*—Oxide of iron was recommended by Mr. Ayres, and not by us, for deepening the tints of the Hydrangea and Chinese Primrose.‡

Aloes.—*An Old Subscriber.*—Your Aloes, which you have plunged in tan in a Cucumber pit, will be perfectly safe, provided the tan is dry and the frame is well covered with mats during frosty weather. ‡

Roses.—*A Boltonian.*—The kinds best suited for a greenhouse are the Red and White Provence, Spong's, Moss, Crimson Perpetual, and Fairy Roses.‡——*S. S.*—We recommend you to leave your newly-planted Hybrid China Roses unpruned, until all danger of severe frosts is over. All dead or unsightly shoots should then be removed, and the remaining ones should be cut back to as many buds as you think they will each be able to support. ‡

Peach Trees.—*W. M.*—It is very doubtful whether the practice of washing Peach trees with water almost at a boiling temperature is a good one. We think it a much better plan to procure some tenacious clay, and dilute it with water until it becomes of the consistency of paint: with every gallon of this clay paint, half a pound of sulphur should be mixed. This dressing applied with a paint-brush *all over* the trees at the time the buds begin to break, will check the prevalence of mildew and insects ‡

Grafting.—*C. C. B. P.*—Several varieties of Apples or Pears may be grafted on the same stock with equal success; but some knowledge of the varieties is necessary, in order that strong and weak-growing kinds may not be placed together. The consequence of so doing would be, that the strong would overgrow the weak, unless the latter were placed in a position the most favourable for growth, as on central or upright branches; whilst the strong-growing kinds were limited to horizontal shoots. ‖

Fruit-trees.—*L. G.*—For the north, south, east and west aspects 90 feet each of the fence round your kitchen garden on which you wish to plant Pears, Cherries, and Plums, the following are suitable:—*North aspect:* 2 Morello and 2 Kentish Cherries; 1 Orleans Plum; 1 Bézi d'Héri Pear for stewing. *South aspect:* Mayduke and Elton Cherries; Greengage and Coe's Golden Drop Plums; Glout Morceau and Beurré Rance Pears. *East aspect:* Knight's Early Black and Florence Cherries; Royale Hâtive and Purple Gage Plums; Jargonelle and Hacon's Incomparable Pears. *West aspect:* Marie Louise, Beurré Bosc, Winter Nelis, Hacon's Incomparable, Thompson's and Passe Colmar Pears. Having room on a south wall for only one Peach and Nectarine, you may plant the Bellegarde Peach and Violette Hâtive Nectarine. ——*P. W. J.*—Three standard Pear-trees of good quality, and ripening at different periods, are the Marie Louise, Hacon's Incomparable, and Beurré Rance.‖

Strawberries.—*C. C. B. P.*—The following is a selection of the most esteemed varieties:—*Scarlets:* Old Scarlet, early, and affords the finest colour for confectionery; Grove-end Scarlet, a great bearer; Roseberry, abundant bearer in succession; American Scarlet, late and very sugary, grows tall, and therefore requires plenty of room; Coul Late Scarlet, good bearer and late. *Black Strawberries:* Downton, dark-coloured when fully ripe, and its richness is then scarcely exceeded by any variety in cultivation; Myatt's Pine, esteemed the richest, but difficult to cultivate; Elton, a seedling raised by Mr. Knight of Downton, a great bearer, ripening late, and is found to be well adapted for preserving whole. *Pine Strawberries:* Keens' Seedling is the best for general cultivation; Old Pine has a more solid flesh and leaves of darker green than any other of this class; Myatt's British Queen, very large and well flavoured, grows and bears well; Swainstone Seedling, large, good, and prolific, bearing sometimes a second crop in autumn. *Hautbois:* Prolific or Conical, flowers large, stamens long, with anthers fertile; Large Flat, scarcely so rich as the preceding, but a most abundant bearer. ‖

Currants.—*C. C. B. P.*—The best *Red* sorts are the Red Dutch, Knight's Sweet Red, and Knight's Large Red. The best *White* is the White Dutch. The finest and largest variety of *Black* is the Black Naples. ——*An Old Subscriber.*—The Currant of the shops is prepared from the black Corinth Grape, which is merely a stoneless variety of the Common Grape. The Sultana Plums of the shops are furnished by the White Corinth or Kishmish Grape. They are both prepared by being dried in the sun like raisins. The thorns which you have observed amongst them are only accidental impurities. ‡

Asparagus.—*T. Summers.*—Asparagus-beds should be formed about 3½ ft. in width, with alleys 2 ft. wide between them; they require no particular preparation beyond a previous good trenching. Instead of procuring young plants, let Asparagus seed be sown in March, in drills 18 in. apart, and 2 in. deep. When the plants are 6 in. high, they should be thinned to about 1 ft. apart; and in the following spring a layer of rich or stimulating manure, a few inches thick, should be spread over the bed, and dug in lightly when the plants have done growing in the autumn. During the growing season the beds should be copiously watered with salt and water, or salt should be strewed over the beds, the particles of which will be carried down to the roots by heavy rains and frequent waterings. In the third spring from the time of sowing, the Asparagus will be fit to cut: but previously to cutting, the bed should be covered very lightly with dead leaves to the depth of 8 in. In the autumn, these leaves should be removed, and another dressing of rich manure should be applied; and these operations should be repeated every season. Sea-sand, where it can be procured, will be of great value in mixing with the soil; and where irrigation is practicable, it should on no account be neglected. ‡

Artichokes.—*Discipulus.*—The Artichoke contains a small quantity of gallic acid—the substance which, together with a salt of iron, constitutes black ink. All vegetables which become black when cut with an iron or steel knife, contain gallic acid. *E.*

Early Carrot.—*D. Ferguson.*—The Carrot which you have sent, and which you state to be the best known for early forcing, on account of its fine colour when young, and which is also excellent for sowing in the autumn and covering with leaves for winter use, is the Early Short Red Dutch, the same as that distributed by the Horticultural Society last season. ‖

Potatoes.—*H. T. S.*—Some of the best varieties are mentioned at p. 481. The best kind for the poor is one that is very productive, and of good floury quality—such is the Bread-fruit Potatoe. ‖

Hylurgus piniperda.—*W. Proctor.*—The beetles which you have found in the shoots of young Fir-trees, lately transmitted to you from the Nurseries, are called Hylurgus piniperda, which feeds upon the pith of the young branches. The maggot from which the beetle is produced lives on the stagnated fermented juice under the bark. The only successful method of preventing its increase is to cut off and burn all the shoots which appear to be infested by it. Such plants will not, of course, be paid for by the person to whom they were sent. ‡——*F. B.* is informed that the beetle so destructive to the Scotch and other fir-tees, and named Hylurgus piniperda, is figured and described in Curtis's Brit. Entomology, pl. and fol. 104.—*R.*

Wasps.—*A Novice.*—Of what use are they! Do not they destroy decaying animal and vegetable matter, and serve as food for birds? Depend upon it, they have their part allotted to them in the economy of the world just as much as you and I. Nothing has been created in vain; of that you may be well assured. †

Books.—*E. H. T.* will probably find Mrs. Loudon's Gardening for Ladies the very book for her.†——*A Subscriber.*—The new edition of the Catalogue of the Fruits in the Garden of the Horticultural Society is descriptive. We shall give you some account of it presently.†——*A Journeyman Gardener.*—The Supplement to Loudon's Encyclopædia of Plants contains a large proportion of the plants which have been introduced of late years into this country. The alterations which have taken place in their nomenclature have also, to a certain extent, been rectified. The natural arrangement of plants is substantially in accordance with that at present existing. ‡——*H. W. G.*—Hind's Arithmetic is a book well adapted for persons who are desirous of acquiring a knowledge of that science without the aid of a teacher. ‡

Horticultural Society.—*Vix.*—Young men are admitted into the Society's Garden upon the recommendation of a Fellow of the Society. No one else has the privilege; it is usually, however, a couple of years after the application is made before the applicant can be received.†

Exhibitions.—*Rus.*—If vegetables are really very fine, they are admissible at the meetings of the Horticultural Society, both in Regent Street and at the Garden. Ample notice is always given by us of the days on which these exhibitions take place. A certificate for Celery was given at the last meeting in Regent Street to the Gardener of Mr. George Crawshay. Any one may exhibit. It is only required that the objects sent shall be in the room three hours before the hour of meeting.†

Food of Plants.—*Rus.*—Liebig is very obscure in his statement about the action of the atmosphere on plants. If you infer from what he says, that plants after the full development of their leaves derive their sole subsistence from the atmosphere by the absorption of those different gases necessary to supply their organic substances, and that humus merely supplies them until the full development of their leaves, you will assume that which is far from being proved, and is by no means probable. At the same time, it is true that the application of manure in a liquid form subsequent to the full development of the leaves is of much less use than at an earlier period, but we do not see how that fact is at variance with the best cultivation. No one manures plants after they have ceased to grow; and it is not till they cease to grow that the leaves are fully formed.†

Growth of Plants.—*A Subscriber.*—We are not aware that plants grow faster in a fine moonlight night than they do in a dull one, supposing the thermometer precisely the same. We have no reason to suppose that a higher temperature may be kept in a vinery in a clear moonlight night than in a dull one, unless it is to counteract the coldness, which is so much greater in clear nights in winter than in cloudy ones.†

Corn.—*A Proprietor.*—It is stated that in England and Wales 3,800,000 acres are annually in Wheat, out of 12,000,000 under tillage. It is further reported that these produce 12,380,000 quarters of Wheat annually, or 26 bushels an acre. The distance at which Wheat should be dibbled will depend upon the condition of land and the mode of cultivation. It may be set wider in spade husbandry than on ploughed land. ‡

Tree Guards.—*Abrus.*—A cheap, light, but strong fence, to protect trees from cattle, may be made in the following manner: Provide stakes of Larch, or other sound wood, rather straight, 6 feet long and about 3 in. in diameter, making use of the waste ends by cutting them into 3-in. pieces; then take rod iron in 6-feet lengths, turned up 1 in. at one end and painted at the other. Thus prepared, burn holes with a piece of iron rod through the stakes, 12 in. from top and bottom, in the same direction, and through the centre of the 3-in. pieces from end to end, having 10 of each; run the iron through them alternately, commencing with the stake, and ending with a 3-in. piece; then bend the whole circularly round the tree, tying it to the other side by twisting the spare iron rod (about 10 in.) round the next stake. It is also advisable to drive three larch stakes, 3 ft. long, half-way into the ground, at equal distances, within the circle of the guard, to keep it in an upright position, else cattle will force it against the tree, and the bark will be injured by the upper part of the guard.

Fences.—*Discipulus.*—The Spruce Fir will bear the shears just as well as Yew, and makes excellent fences. It was one of the *topiarian* plants formerly used; specimens of which will be found in Mr. Loudon's "Arboretum Britannicum," vol. 4, p. 2306. You have nothing to do but to plant it, and when it begins to grow, to prune or clip it according to your fancy. We do not suppose that cattle will touch it.†

Gardeners.—If *Camphorosma* had given us his address, we would have endeavoured to do something for him. He had better call on Dr. Lindley, 21, Regent Street.†

Garden Walks.—*K. L.*—In summer, excellent walks may be prepared in the manner described at p. 379 of this year's *Chronicle*. In the mean while, you had better strew cinder-siftings over the ground. †

Damp Walls.—*A Young Lady.*—The reason why damp is found on your walls is this: when the air is loaded with moisture and comes in contact with anything colder than itself, its vapour is condensed, and runs down in the form of water. Bring a cold wine-glass into a warm room, and it is immediately covered with dew. Impel your warm breath on a cold glass, and the same thing happens. Your walls were no doubt colder than the damp air that touched them on those days when you found the water trickling down them.†

Gold and Silver Fish.—*A Correspondent* asks if we can inform him how he may keep gold and silver fish alive through the winter. During summer they do very well in a pond 3 ft. deep by 12 in diameter, but he has been recommended to take them out during winter. Accordingly, about a month since he put them all (about 20) into a tub containing 30 gallons of water; one half of which he takes out every day, and replaces it either with rain water or from a large pond. He keeps them protected from frost, but in mild weather he places them out of doors. A few worms and some crumbs of bread are occasionally thrown into the water. He has lately lost one of the largest of the gold ones, four or five of which generally perish every winter. He is never able to keep any of them after they are from 10 inches to a foot long, the silver ones appearing to be more tender than the others.—We regret that we cannot give him any information that will be satisfactory. The fish spoken of as dying are stated to be the largest,—from 10 to 12 inches long. These would be most readily affected by the transition from comparative liberty to the confines of a prison, particularly as the size is beyond the ordinary standard. Yarrell, in his History of British Fishes, page 320, vol. I., says, "I have not seen any specimen that exceeded 10 inches in length." The higher the temperature of the water is preserved, with light and air, the better chance the fish will have of living through the winter. We should think the daily change of one half of the water, which the writer speaks of, quite unnecessary, and it is probably injurious, by lowering the temperature too much. There may be other circumstances which cause the loss complained of; but to attempt to offer a remedy without more precise information would be impossible. We have no doubt it is correct that the silver is more tender than the gold fish: the latter is the species from which the former is a variety; probably caused from some diminished constitutional strength, which renders it more tender and difficult to preserve under unfavourable circumstances. *B.*

Miscellaneous.—*Arbutus.*—Your plants are Juniperus sinensis, a Pinaster, a species of Ephedra, and the entire-leaved variety of Arbutus Unedo. The other we do not know.†——*F. M.*—The Cirrhopétalum sinense will be figured in the Botanical Register, a work published in monthly parts.‡——*A Subscriber.*—Your seedling Pæony would be very likely to gain a prize at the Exhibition of the Horticultural Society, if it answers to the description which you have given; but flowers only will be required.‡——*G. W.*—We do not recognise any known Dendrobium in the stems you have sent; but they are not studiable.†——*H. K. M.*—We fear after all that your Medicago is only a starved state of M. lupulina; we did not recognise it in its puny condition.†——*A Constant Reader* will see in another column a notice of Daniell's manure, which was in type before we received his obliging communication.†——*A Constant Reader.*—Your plants are 1, Thuja orientalis; 2, 3, T. occidentalis; 4, Juniperus oblonga; 5, J. virginiana; 6, J. suécica; 7, Cereus flagelliformis; 8, Opúntia brasiliensis: 9, O. Tuna (?); 10, O. Parote; 11, O. vulgaris; 12, Aloe mitræformis, *var.*; 13, A. verrucosa; 14, Gastéria obliqua; 15, Helleborus fœtidus.¶——*J. C.*—Your plant is the Plagianthus sidoides of the Botanical Magazine, now called Asterotrichion sidoides.——*A Subscriber from the commencement.*—Your plant is Lycopódium involvens.†——*Bictonensis.*—Your specimen appears to be Morrénia odorata, a plant of the Asclepiadaceous order, and not at all related to the Passion-flower.†——*M. W. K.*—The *Gardeners' Chronicle* for 1841 is not to be had. About twenty Numbers are out of print ——*J. R. W.*—Of the Numbers of the *Gardeners' Chronicle* prior to 10th Sept., nineteen are out of print.——*E. R.*—We hardly know what to say about your plan. It would give us great pleasure to be of use; but we do not see clearly in what way to proceed. We will, however, put out a feeler as soon as we can get a little room.†——*T. Garrett.*—Your Herne-hill Seedling Apple is a handsome Pearmain-shaped fruit, which keeps well and can be recommended as worthy of cultivation.‖——*D. W. S.*—Your Apple, raised from seed of the Nonpareil, has sufficient merit to be worthy of further trial; but it does not possess the rich, brisk, and unrivalled flavour of its parent. ——*Robert.*—Your Plant is Cacália articulata. ‡——*A Constant Reader's* plant appears to be Thunbergia coccinea. ——*W. B. H.*—We are sorry we cannot adopt your suggestion. ‡——*W. Gardner.*—Your specimen is Zygopétalum intermédium.†—*Shropshire.*—You will find a list such as you request, with the varieties arranged in the order of ripening, at p. 641 of this year's *Chronicle.*‖——*R. E., Oulton.*—The Apples are—No. 1, Braddick's Nonpareil; 2, Court-pendu Plat; 3, Ord; 4, King of the Pippins; 5, Golden Harvey; 6, probably Blenheim Pippin; 7, Pomme Violette; 9, Embroidered Pippin. The Pear, No. 8, is the Easter Beurré. ‖——*Mary.*—If in your case, we should ask 25*s.*——*Quince.*—Your Apple is the Blenheim Pippin. ‖

Erratum.—In the answer to *W. J. B.* at p. 841, col. *a*, line from the bottom 15, the Pelargoniums mentioned were those to be discarded, the word "not" having been omitted.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The affairs of Barcelona in the beginning of this week assumed a character of very grave importance. Circumstances were stated which appeared to show that the French Consul was a conspicuous actor in the recent insurrection; and if the charges brought against him be substantiated, there can be little doubt that the relations between France and Spain will be seriously compromised. The Spanish authorities accuse the Consul of having originated the insurrection, of having identified himself with the acts of the revolutionary Junta, of having induced the Queen's troops to surrender to the insurgents by representing that the rebellion had spread to the adjoining provinces, and of having refused to give up the wife and daughters of the Capt.-General Van Halen, who had placed themselves under the protection of the French flag, stating that he was responsible for them to the Junta. In addition to these charges, the political chief of Barcelona, who was of course an eye-witness of the progress of the insurgents, has published a statement, declaring that the revolutionary Junta had dissolved itself on the 2d, and taken refuge on board the French ships of war; that the town was on the point of capitulation when the Consul made the Junta disembark and renew the insurrection, at the moment when the inhabitants considered that it was effectually suppressed without bombardment, or violence of any kind. He states that the flag of Queen Christina was then hoisted, the revolutionists again became masters of the city, and the Regent was obliged to resort to extreme measures to reduce it to obedience. Some doubt, however, has been thrown on the testimony of the political Chief, although the Government Papers have openly denounced the Consul as the originator and promoter of the revolt. In the mean time the French Government have given an apparent sanction to the proceedings of their Consul by conferring on him the rank of an officer of the Legion of Honour,—an act which is regarded by the Spanish authorities as a proof that the Court of France was not altogether unconcerned in the issue of the insurrection. The Consul, has also sent a strong protest to the Captain-General, denying the charges altogether, and demanding satisfaction. The Regent, at the date of our last accounts, had resolved on raising the siege of Barcelona, and granting a general amnesty prior to his return to Madrid; the Military Commission was still sitting, but few executions had taken place, and tranquillity was completely restored in all parts of Catalonia. The Paris Papers are of course occupied with the discussion of these events; they state that the Spanish Government have disavowed the conduct of the political chief, and that the charges against the Consul will be proved to have no foundation. In the beginning of the week the affair was considered so serious in Paris, that a fall took place in the funds, although a rupture between the two countries is no longer anticipated.—The news from Portugal is not important; the Government has been occupied with the consideration of the views of the British Cabinet on the Tariff question, but no immediate result is anticipated, and the prospect of a settlement is still far distant.—From Belgium, we learn that the arrangements of the Chamber for the discussion of the treaty with Holland are now complete, and that the question will be the first business brought forward after the Christmas holidays.—The German Papers announce that the Prussian Government is engaged in negotiating a treaty of commerce with Belgium, and that in consequence of the recent attempts to effect a commercial union between that country and France, the King of Prussia has determined to make numerous concessions for the accomplishment of this treaty. The Wurtemberg Government has issued a notice, announcing an immediate reduction in the interest of the National Debt, and a similar measure is said to be contemplated by the Government of Bavaria.—From the Levant we have the important news, that the recent events in Servia have led to a complete rupture between Russia and Turkey. The Emperor, as the protector of Servia, has demanded the immediate deposition of the newly-appointed Prince, and the restoration of Prince Michael, in whose family, he contends, the sovereignty is permanently vested. The Sultan has refused to comply with this demand; and it is rumoured that the Russian Ambassador has threatened to leave Constantinople. The policy of Russia in thus interfering with the acts of an independent sovereign is said to be justified by the Treaty of Adrianople; but it remains to be seen whether Austria and the other European Powers will allow any armed intervention in the provinces on the Danube.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, continue at Windsor Castle, and are quite well. The Queen has taken daily exercise on foot during the fine weather which has prevailed the greater part of the week. The Prince hunted with his harriers on Thursday, and shot over the preserves in the Great Park on Monday, and again on Wednesday, accompanied by the Duke of Wellington. It is stated in the Ministerial Papers that Her Majesty's accouchement is expected to take place in the spring, and that the Duchess of Kent will be deputed to hold the drawing-rooms during the season, supported by Prince Albert. The Queen Dowager paid an unexpected visit to the town of Poole on Saturday. Her Majesty drove round the quays, and soon afterwards returned to Canford, where she continues to enjoy excellent health. The Hereditary Grand Duke of Mecklenburg Strelitz left the residence of their Royal Highnesses the Duke and Duchess of Cambridge, at Kew, on Tuesday, and embarked for Hamburg, on his return to Strelitz. His Imperial Highness the Archduke Frederick of Austria took his departure from Portsmouth on Wednesday, in his frigate the Bellona. After his return to Portsmouth, his Imperial Highness visited all the public establishments—the dock-yard, gun-wharf, victualling-offices, Haslar Hospital, the flag-ships St. Vincent and Victory, the Excellent gunnery-ship, and the Warspite. The Archduke also visited Ryde, and attended the inspection of the Royal Marine Artillery.

Ministerial Changes.—A rumour has been current for some days that the Duke of Wellington has objected to hold the leadership of the House of Lords in conjunction with the Horse-Guards; and that the Cabinet is divided between the claims of Lord Aberdeen and Lord Stanley to that office. The Ministerial Papers seem to suggest the probability that Lord Stanley will receive the appointment; in which case he will of course be raised to the peerage, and thus create a vacancy in the representation of North Lancashire.

Parliamentary Movements.—Lord Clive has announced himself a candidate for North Shropshire, in the room of Sir Rowland Hill, as anticipated in our last. The election of a Member for Carmarthenshire took place on Tuesday, when Mr. S. Davis was returned without opposition.

Foreign.

FRANCE.—The affairs of Spain are the leading topic of discussion in the Paris papers, which comment on the insurrection and subsequent bombardment in total forgetfulness of the part played by France in her two revolutions, and of her subsequent line of conduct for the effectual maintenance of order in the interior. The most important fact in relation to this question is the official announcement that M. de Lesseps, French Consul at Barcelona and Capt. Gattier of the French corvette Meleagre, stationed in that port, have been promoted to the rank of officers of the Legion of Honour. The accounts published in the Spanish papers respecting the interference of the Consul in the late insurrection produced an unfavourable impression on the Bourse last week, and caused a fall in the price of stock, as the speculators deemed it possible that the representations of the Spanish Government on the subject might be so strong as to bring about a quarrel between the two countries. It was generally expected that the Consul cannot remain at Barcelona, and that the Spanish Government will not suffer a foreign agent, whom it believes, and on strong grounds, to have originated and fomented the revolution, to remain longer in the town. The papers offer numerous explanations of the proceeding; the Ministerial *Débats* denies the statement that the Consul refused to deliver up the wife and daughters of the Captain-General, and states that the ladies were not arrested by the mob or junta on shore, but in a boat belonging to the French ship-of-war; it would therefore appear from this admission that the arrest took place while they were actually under the protection of the French flag. In a few days some official accounts will no doubt be published, and in the mean time it would be useless to enter further into the party statements of the journals.—The *Moniteur* of Saturday officially announces the occupation of the Marquesas Islands by Admiral Dupetit Thouars, and his having hoisted on the two groups the standard of France. The Admiral states that he occupied the Island of Tahuata in the name of France, at the request of the native King or Chief, in order to protect him from the consequences of an act of aggression against the Americans. He states in his report that he conciliated the King by a present of a red uniform and a pair of Colonel's epaulettes, and that the favour of the Queen was secured by a present of a petticoat, which she had seen one of the sailors wear at an exhibition of private theatricals. It was reported in Paris that Government intends to make the islands a penal colony.—The only subject of domestic interest in the capital, is an action which has just been decided in connexion with the conspiracy of Grenoble. It was brought by General Donnadieu against M. Creteneau Joly, formerly editor of a Royalist print, for breach of contract, by not publishing a work called the "History of the Didier Conspiracy in Grenoble," with eighty-three letters of the Duke Decazes, the present Grand Referendary of the Chamber of Peers, throwing a light on that mysterious event. The Court, in its judgment, gave default against M. Joly; but at the same time nonsuited the General, as the promise of the editor to publish the book was not regarded as sufficient for the basis of a civil action. The anti-dynastic prints, commenting on this decision, call upon the Duke Decazes to explain his conduct in 1816, as he was Minister of Police at the time of the Grenoble affair, and to reply to the accusations of General Donnadieu, who charges the Duke with having been the abettor and employer of Didier in that revolt, the object of which has been, in turn, explained as a Buonapartist, Republican, or Orleans plot to overthrow the Government of Louis XVIII. On the other hand, it is announced that the Duke Decazes will bring an action against M. Joly, for announcing the publication of the letters alleged to have been addressed by the Duke to an agent in Grenoble to provoke the conspiracy of 1816.

SPAIN.—The intelligence from Barcelona comes down to the 13th inst. The bombardment has completely restored tranquillity to Catalonia; and the news now received relates exclusively to the details of the late events and to the proceedings of the French Consul. The Regent was still at his head-quarters at Sarria, and Gen. Zurbano had left for Gerona. The city had not recovered from its stupor, and most of the shops and warehouses had remained closed. The Military Commission was still sitting; 13 individuals, soldiers of the Free Corps, were drawn by lot from those who were found guilty, and were shot on the 12th, at which time no Spaniard was allowed to leave the city. The damages occasioned by the bombardment were to be repaired at the expense of the municipality, which was obliged to supply for the purpose daily 1,000 workmen, and pay a war-contribution of 120,000*l.* within three days. The proclamation relative to the delivery of fire-arms had been rigorously enforced. Fifteen thousand muskets had been already taken from the insurgents; and as it was supposed that there were still five or six thousand not surrendered, twenty-four hours more were given for their delivery. The houses shut up and suspected of containing arms had also been opened and searched in the presence of the magistrates in their respective districts. For some time to come, a national guard will be dispensed with in Barcelona, and the garrison be kept by troops of the line alone. A deputation, composed of six of the notable inhabitants of Saragossa, arrived at the Regent's head-quarters on the 10th, to congratulate him, in the name of all classes of the population of that city, on the suppression of the revolt at Barcelona. The National Guard of Saragossa have also sent to the Regent a similar address of congratulation. The Regent was expected to return to Madrid on the 15th. He was to return by Valencia, being desirous not to encounter the Infant Don Francisco de Paula, who will, in all probability, be ordered to quit Spain, with his Secretary, Count de Parsent. The *Heraldo* asserts that the order had been already given to the Prince. Immediately after the return of the Regent, the Cortes were to be convoked. The first question which will occupy attention is the change produced in the relations between France and Spain by the conduct of M. Lesseps, the French Consul, during the late outbreak. He is accused of having originated and fomented the insurrection, of having rendered himself a mere commissary of the revolutionary Junta, accompanying its members to the camp of Van Halen and elsewhere, and especially of spreading false reports, and telling the Queen's troops that Catalonia, Arragon, and Valencia were in insurrection, which report induced those troops to surrender. He is accused of having refused to give up the wife and daughters of the Captain-General, Van Halen, declaring himself responsible for them to the Junta; and of having disembarked from the French ships the leading men of the revolution, on the night of the 2d, and thus renewed the insurrection at the moment when the town was on the point of capitulating. These facts, stated in the official journals of the Spanish Government, are supported by the testimony of the political chief of Barcelona, Señor Gutierrez, who writes on the 3d from Sarria, where he had taken refuge, describing the progress, the cessation, and resumption of the insurrection. He states that on the arrival of the Regent, the revolutionary Junta had dissolved itself, and that its members went on board the French ships, whilst the newly-raised corps had laid down their arms. The French telegraph announced at the same time with the news of the China pacification, that of the capitulation of the Barcelonese. This was, in fact, considered complete, without bombardment and without violence. "This change for the better," says the political chief, "was done away with by the Consul of France, who made the Junta disembark, and the revolutionists again became masters of the city, the National Guards quitting it. The bandits hoisted the standard of Christina, and sacked the houses of the street da Ancha, and that of the Platercás. This necessitated the opening of fire upon the town." These proceedings, in themselves sufficient to compromise the relations between France and Spain, have been still further aggravated by the act of the French Government, in conferring on the Consul the rank of an officer in the Legion of Honour. This fact is regarded as a proof that the Court of France was not unconnected with the late insurrection; and the explanations to which it must give rise are looked for with some anxiety. The latest accounts state that the Consul has sent a strong protest to the Captain-General, denying the charge altogether, and demanding satisfaction, by the dismissal of the political chief. The Regent had resolved on raising the siege of Barcelona previous to the 18th, when he intended to issue a general amnesty, prior to his return to Madrid. At the meeting of the Cortes, the whole history of the late proceedings will no doubt be developed.

PORTUGAL.—We have news from Lisbon to the 12th inst. The Portuguese Government had the views of the English Cabinet on the tariff question under their consideration, and Lord Howard has had an interview with the Duke of Palmella, but it was not anticipated that any immediate result would be arrived at, and the settlement of the questions at issue was considered as distant as ever. The trial of the *Nacional* newspaper for libel on Senhor Silva Cabral, in charging him with the authorship of the late proclamation against M. Dietz, and stating that they knew where the manuscript copy existed, was decided on the 10th. No manuscript copy was produced, nor was any evidence beyond hearsay brought to connect the matter with Senhor Cabral. Notwithstanding this, the jury returned a verdict in favour of the defendant on all the questions: that there was no abuse of liberty of the press—no criminality, and consequently no punishment required.—Accounts from Madeira state, that more serious damage has been done by the late inundations than even would have been inferred from the first accounts. It is stated, that the beautiful district of Fayal, from which the Duke of Palmella's heir takes his title, and which was one of the richest portions of the island, presenting everywhere the aspect of a garden, and growing some of the best wine in Madeira, is now a desert, with huge boulders carried down from the mountain by the floods, strewing the ground which was lately occupied by vineyards; and that years must elapse before so many as 10 pipes of wine can be made from the growth of this district. The great bulk of this year's vintage has also been destroyed in the stores of Funchal. The entire loss sustained, including damage of every description, has been little short of half a million sterling. Many wine-merchants lost from 300 to 400 pipes of wine, valued, one with another, at 80 milreis (18*l.*) a pipe; and several farms, produce, cattle, utensils, and even soil, were swept into the ocean. A committee has been appointed to raise subscriptions in Lisbon, but as yet not one farthing is publicly known to have been collected in that city, among the Portuguese themselves.

BELGIUM.—Letters from Brussels state that the arrangements of the Chamber for reporting on the treaty of the 5th Nov. are now complete, and that the discussion will be the first subject brought forward after the Christmas holidays. It appears that the continuation of the iron railway from Ghent to Antwerp, through Lockerin and St. Nicholas, will be announced sooner than was expected; 1,258 shares of 1,000f. each are already subscribed for. A fatal accident has occurred on the portion of the international railway in the interior, between Quicorain and St. Saulve. The train which left Quicorain in the afternoon of the 14th, ran off the rails at Quarouble in France; the man on the look-out on the tender was killed, and a custom-house officer had his thigh broken; none of the passengers were injured. It seems that a rail which was raised up at one end caused this accident, and eye-witnesses think it was the effect of malice. The service is stopped until the official inquiry into the causes of the accident be completed.

GERMANY.—The Berlin papers announce that the Prussian Government is seriously occupied with the arrangement of a treaty of commerce with Belgium, and that as such a measure is now considered a political question, numerous concessions will be made to the Belgians. It is also stated that an army of 10,000 men might be formed of the Russian deserters who have fled into Prussia, since the refusal of the King of Prussia to renew the convention for the exchange of deserters. We learn from *Galignani's Messenger*, that when the King of Prussia was returning from St. Petersburg in July last, he stopped a night at the little town of Hohenstein. Captain Kern, owner of the domain of Dohlau, took advantage of the King's passing through to request his autograph, in order to place it in a new church built on the captain's property. His Majesty promised to grant it the next day, when he wrote the following lines:—"Being requested to give my autograph, to be preserved in the new church of Dohlau, I here express my earnest prayer that the Holy Scriptures may always be preached in this church, in this commune, and in this country, to the end of time! May God be with you. Written at Hohenstein, the ninth Sunday after Trinity, July 24, 1842, on my return from Russia, after celebrating the anniversary of the marriage of my beloved sister Charlotte with the Emperor Nicholas, on my way from Kœnigsburg to Erdsmandorf, in Silesia, after having yesterday made the acquaintance of the founder of the new church, the worthy Captain Kern, owner of the domain of Dohlau. FREDERICK WILLIAM."—Letters from Vienna state, that the effects of the peace with China begin to be felt in that city in several ways, and that the cotton manufactures in particular have received a new stimulus, and prices have risen considerably.—The Duke de Bordeaux has arrived at Dresden on a visit to the King of Saxony, where he has been received with every mark of attention on the part of the royal family. He had paid a visit to the field of Culm, celebrated for the battle of 1813, and was expected to visit Leipsic before his return to Prague.—The *Augsburg Gazette* announces that the negotiations relative to the marriage of Princess Clementine of Orleans with Prince Augustus of Saxe Coburg Gotha Cohary were terminated, and that the contract would be shortly signed and ratified by both parties.—The Wurtemberg Government has issued a notice, apprising all the holders of the public debt that the interest, now 4 per cent., will be immediately reduced to $3\frac{1}{2}$ per cent.; and that the state is ready to pay in full all those not disposed to submit to the reduction. The annual saving effected by this measure will be about 110,000 florins. The Bavarian Government also contemplates a reduction of the interest on the public debt from 5 per cent. to 4 per cent.—It is stated that the King of Hanover intends to visit England after the marriage of the Prince Royal, for the purpose of consulting his former physician, Sir Henry Halford, his confidence in German physicians having diminished considerably since the death of Dr. Stieglitz. His Majesty, on being informed that a subscription had been set on foot for the relief of the widow and family of the late Dr. Maginn, immediately forwarded a donation of 200*l.*

ITALY.—A letter from Rome of the 6th inst. states that the King of Naples had offered himself a mediator between Don Miguel and the Queen of Portugal, and with more success than the Pope. The news of the late victories in China had created much satisfaction at Rome, being considered as essentially favourable to Christianity.—Letters from Palermo and Catania have been received, stating that on the evening of the 27th ult. an eruption of Mount Etna took place, after a repose of 20 years. The lava issued in considerable torrents, following two parallel lines, in the direction of Bronte. The damage already done is said to be immense. The fine weather allowed the spectators to roam about the whole night, admiring the extraordinary spectacle. Numerous strangers had arrived to be near the scene. The passengers on board the Oriental steamer were gratified by a sight of this eruption, about two hours after leaving Malta, on the 28th, the mountain bearing at the time N. E. 105 miles. About dusk the passengers and crew were surprised by the unexpected appearance of the eruption, and were so fortunate as to keep it in view for five hours. We have given, under our "Miscellaneous" article, an account of the scene from the pen of an eye-witness.

GREECE.—Letters from Athens of the 30th ult. state, that on the previous day M. Silivergo, the newly-appointed Minister of Finance, became insane while attending a Council of Ministers. They add, that there is no doubt that the Government money matters are quite as deranged as the Minister. Rear-Admiral Sir F. Mason, in her Majesty's ship Howe, is at anchor in the Piræus, which she entered under sail, to the great astonishment of the Greeks. The Princess of Oldenburg arrived on the 23d, on board the Otho steamer. So violent a storm arose between Corfu and Patras, that the steamer was forced to take refuge in the harbour of Pitala, where it remained 24 hours, till the storm abated.

TURKEY.—An express from Constantinople, by way of Vienna, announces the important fact, that a complete rupture has taken place between Russia and Turkey, in regard to the affairs of Servia. The Emperor of Russia, in an autograph letter to the Sultan, had formally demanded the deposition of the newly-appointed Prince of Servia, and the re-establishment of the banished Prince Michael, in whose family, Russia contends, the sovereignty of Servia is invested for ever, by virtue of a firman of the late Sultan Mahmoud. The Porte, in its reply, has declared that no treaties had been infringed, and that the privileges of the Servians had been properly regarded in the course pursued by the Porte, which positively declined to revoke the hatti-sherif. The Russian Ambassador, on the receipt of this note, replied, that he regretted to have to announce to the Emperor the Porte's unfavourable answer, and that he still hoped it would be modified. The Divan is said to have offered to submit the matter to the consideration of the Five Powers; but it was not known whether M. de Boutenieff would consent to this proposition, or what determination the Court of St. Petersburgh would come to. Whatever opinion the Emperor may entertain on the Servian revolution, it is said that the treaty of Adrianople allows the intervention of Russia.

CANADA.—The *Toronto Herald* of Nov. 24, received by the last arrival from New York, stated that Sir Charles Bagot's illness had assumed the most serious character. His complaint was said to be an affection of the lungs, produced by excited action of the heart, and causing great difficulty of breathing, with an almost total want of natural sleep. It was supposed at Toronto that he had tendered his resignation by the last mail, and believed that he would not live to receive Lord Stanley's answer. The *Standard* of Thursday announces with regret that private letters have been received in town, which fully confirm the above intelligence relating to the dangerous illness of the Governor-General. At the date of these letters no hope whatever was entertained of his ultimate recovery. Sir Charles for some time had not been able to sleep until opiates had been administered.

CITY.

Money Market, Friday.—The Consols market has been much depressed during the latter part of the week in consequence of the apprehended rupture between France and Spain. Consols for the account closed $93\frac{1}{2}$; Three per Cents. Reduced, $94\frac{1}{4}$ to $\frac{3}{8}$; Bank Stock, $170\frac{1}{4}$ to $172\frac{1}{2}$; Exchequer Bills, 49*s.* to 51*s.* pm.; Three-and-a-half per Cents. Reduced, 101 to $\frac{1}{8}$; Long Annuities, 12 $\frac{9}{16}$ to $\frac{5}{8}$.

Metropolis and its Vicinity.

Christmas-day in the Metropolis.—During the past week the Lord Mayor has received several requisitions, signed by many hundreds of the citizens of London, respecting the observance of Christmas-day on Monday. They state that the concurrence of Christmas-day and Sunday threatens the deprivation of a highly important holiday; that, under any circumstances, the loss of an opportunity of relaxation and enjoyment must be matter of regret; but when, as in the present instance, the evil is likely to be aggravated by a more than ordinary profanation of the Sabbath, it is doubly to be deplored. They therefore submit the propriety of his Lordship originating some measure to obviate this evil; and state that, proceeding from the first magistrate of the Metropolis, a recommendation to the citizens to observe the Christmas feast by a suspension of business on Monday, the 26th inst., cannot be disregarded by them, and must influence the cities and towns throughout the kingdom. The Lord Mayor, on receiving the requisitions, said it would give him the greatest pleasure to carry out the views of so numerous and respectable a body of requisitionists, by officially recommending that Monday, the 26th, be kept as Christmas-day; but he could not make any recommendation of the kind without consulting the principal merchants and bankers. It is now announced that there will be no holiday at the Bank, Stock Exchange, or the public offices.

The Royal Bounties.—Her Majesty's annual bounties were distributed on Monday and Tuesday to upwards of 800 poor, old, and distressed persons, who had been previously recommended by the clergy, nobility, and gentry, residing in the various parishes. The bounty is limited to persons who are above the age of sixty years, and the exception to the rule is made in favour of the blind, and of those who are afflicted with severe bodily infirmity. The Royal gate alms to 168 persons, each receiving thirteen shillings, were also distributed.

Election of Common Councilmen.—Wednesday being St. Thomas's Day, wardmotes were held, according to ancient custom, in the different wards of the City, for electing members to serve in the Court of Common Council for the year ensuing. Great activity having been exercised by the Anti-Corn-law League and the advocates for free trade to return members who would support their particular opinions, more than usual interest was excited by the elections. In a few instances a strong opposition was offered, and a poll was demanded by the candidates, so that the results of the whole are not yet known, but in the great majority of the wards the elections passed off quietly. In several wards resolutions were passed in favour of free trade and of a repeal of the Corn-laws; and in those of Broad-street, the Tower, and Langbourne, resolutions were carried condemning the Income Tax as "inquisitorial and vexatious," censuring the conduct of the surveyors and assessors, and calling for its immediate repeal.

East India House.—The Quarterly General Court of Proprietors was held on Wednesday, Sir J. J. Lushington in the chair. A motion by Mr. Salomons for the production of papers and accounts connected with the war in Affghanistan was negatived by a large majority, the chairman having stated that the accounts would be called for by Parliament in due course, and then be laid before the proprietors. Mr. Lewis brought forward his motion for the production of papers respecting the Ex-Rajah of Sattara; but on the understanding that additional papers had been received, which had altogether altered the case, and which the Court were anxious to submit to the proprietors, the motion was withdrawn till the next general court. A long discussion then ensued on the non-employment of natives of India in civil offices of their own country. It appeared that the Directors had for some time adopted the principle of employing the natives in civil services, and were gradually extending it so far as is compatible with the security of the Government. The proceedings, which ran to great length, closed with a conversation respecting the Hill Coolies, and the statue of the Marquis Wellesley, which, the chairman said, was progressing satisfactorily, and would be finished very shortly.

Income Tax.—On Friday a numerous meeting was held of the merchants, tradesmen, and inhabitants generally, of the Ward of Tower, for the purpose of investigating the cause of a general complaint in regard to the numerous returns made under the Income Tax having been sent back surcharged. The value of the wharf property made the question peculiarly important. In the absence of the Alderman, owing to indisposition, Mr. Deputy Finnis presided. He said that he had called this meeting in consequence of a requisition signed by a large number of respectable individuals, who considered that they had been improperly and unjustly surcharged. The requisition having been read, the Chairman stated that he would first of all submit to the meeting a letter from the Government Surveyor, Mr. Welch. From this it appeared that there were 611 assessments in the ward under schedule A, and that of these 150 were surcharged, or almost one return out of four; under schedule D the assessments were 1,542, the surcharges 556, or almost one in three. In the whole ward, out of 2,153 returns, no less than 706, or, in other words, the declaration of every third man in the ward, had been called in question. Several gentlemen addressed the meeting, and stated that the surcharges had been made at the rate of 30 and 50 per cent. The following resolution was then proposed and unanimously adopted: "That this meeting, composed of merchants, tradesmen, and inhabitants of the ward of Tower, does not intend to consider, upon the present occasion, the necessity or policy of the Property and Income Tax, the meeting having been convened solely for the purpose of denouncing publicly, and in the strongest language, the manner in which a large number of the returns in this district have been sent back, and the amount of the tax increased by an improper and vexatious system of surcharges; which unwarrantable mode of increasing the tax can only be done by doubting, without investigation or reason, the accuracy of a solemn declaration; and it is, therefore, not only an act of grievous injustice, but also a gross insult to the character of all those whose principles of truth and honesty have been so impugned." It was also resolved that a copy of this resolution be forwarded to the Lords of the Treasury, and a deputation was appointed to confer with the local Commissioners.—The Inhabitants of Marylebone have also manifested discontent at the manner in which the assessment of tradesmen, and the poorer class of persons, is carried on. The course pursued, is to assess them indiscriminately at 150*l.* per annum, leaving the onus upon the parties who are assessed, to prove that they have not so much. At the meeting of the guardians of the poor last week, the secretary laid before the board a notice from the income-tax commissioners, assessing the Marylebone workhouse, to the income-tax, at the annual value of 2,639*l.* giving a duty of 76*l.* 19*s.* 5*d.* The board considered that there could be no claim on a parish workhouse, which comes, in their opinion, under the denomination of charitable institutions; and after some discussion it was resolved to resist the assessment on these grounds.

London Ordination.—On Sunday morning the Bishop of London held a general ordination at St. James's, Westminster. The sermon was preached by the Rev. J. Sinclair, examining chaplain to the Bishop, and vicar of Kensington. The ordination service was then proceeded with, and a large number of gentlemen were admitted into holy orders.

Metropolitan Improvements.—The improvements in Leadenhall Market, which have been in progress for some weeks, are now completed; many of the old buildings and sheds have been removed and handsome shops substituted, with the addition of a large covered market, composed entirely of iron, the pillars which support the roof being of cast-iron, and the roof itself of wrought-iron, presenting an elliptical surface, lighted by plate glass. It is expected that an entrance to the market for vehicles will shortly be made in Fenchurch-street.—On Thursday the Commissioners appointed to carry into effect the act of Parliament for making a new street from Blackman-street in the Borough, to the Blackfriars-road, and for improving the district called the Mint, in the parish of St. George's, Southwark, met for the purpose of receiving the report as to estimates and the best means to be adopted in carrying out, forthwith, the objects specified in the Act. The whole of the Commissioners already appointed were in attendance. The Lord Mayor, and Mr. Quincey Harris, the member for Newcastle, were present, and qualified as Commissioners. The Lord Mayor said, he should cordially co-operate with his brother Commissioners, and render every assistance in his power in carrying out to its full extent the beneficial effects which would result from the passing of the Bill. The report, which was very lengthy, having been read and considered, the commissioners adjourned till a future day.

Metropolitan Churches.—The Church of All Saints, in the parish of St. Pancras, the first stone of which was laid by Sir Robert Inglis in November last, was consecrated on Monday by the Bishop of London, who preached to a large congregation on the occasion. The church is built in the *cinque cento* style, and is said to be the only specimen of it in England. It contains accommodation for 1,200 persons. The parish has a population of 130,000, with church accommodation for only 16,000. The cost incurred in the erection is between 6,000*l.* and 7,000*l.*, towards which the Committee of the Metropolis Churches Fund have subscribed 1,500*l.*, and the Duke of Bedford 300*l.*

Metropolitan Burial Grounds.—On Wednesday, a numerous meeting of the committee of Dissenters, appointed to effect measures for a successful opposition to the Health of Towns Bill, was held at the Congregational Library, in Moorfields, to receive the report of a deputation appointed to wait on Sir J. Graham, and point out to him the alleged injustice of the measures to those who had embarked large capital in the formation of burying-grounds, and who were by the conditions of the bill allowed no compensation for the investment of their money. It was stated that the deputation pointed out to Sir J. Graham, the hardship the bill would inflict upon the Dissenters, and called his attention to the manner in which the evidence had been got up and laid before the house. Sir J. Graham replied, that Mr. Mackinnon's bill had been under the serious consideration of the Government, but they were not prepared to adopt it. In all probability the Government would feel it to be their duty to introduce a measure on the subject in the ensuing session of Parliament, but he could not at the present moment state the exact nature of the bill. After receiving this report, the committee ordered a copy of the report to be sent to the various owners of burying-grounds and other parties interested in the measure.

Messrs. Wright's Bankruptcy.—An application was made a few days since to the Commissioner of the Court of Bankruptcy, to grant a certificate to Mr. John Wright, the senior partner in this firm. The official assignee, upon being questioned by the Commissioner, said, that as regarded the separate estate of Mr. Wright, taking it generally, his report would be unfavourable, inasmuch as too high a value had been put upon the different shares held by him, and that the debtors originally stated to be "good" ought to have been placed under the column of "bad," or doubtful. Mr. Maynard, the solicitor of Mr. Wright, admitted that there had been great irregularity in his conduct, and pleaded in extenuation, that although he had sacrificed the property of others, he had also sacrificed a large fortune of his own. For many of his acts he could offer no justification, but under the old law, the creditors had the power of granting the certificate, and by their offering no opposition, it would be but reasonable to think that they would be now willing to do so, but an *ex post facto* law having now come into operation, he is deprived of that benefit. Full disclosures had been made by the bankrupt before the passing of this act, which would have entitled him to his certificate with the consent of his creditors, and it would, he thought, be harsh now to bind him down by a law of which he could have no possible knowledge at the time that the fiat was opened. Mr. Commissioner Holroyd said, that it must, indeed, be a very bad case to bring it within the provisions of the statute, and this seemed to be a strong case on which to act, although it be under the provisions of an *ex post facto* law. "There are such things" he said, "in his balance sheet, that I should neglect my duty if I passed them over. I shall adjourn the case for a month, but before doing so I shall state my principal objections to it. In 1837 there was a deficiency of 50,000*l.*, of which 45,000*l.* was drawn out by Mr. John Wright, while it also appears that, although his share in the bank only amounted to about 20,000*l.* he has drawn out 100,000*l.* Of this the other partners were not aware; besides 60,000*l.* worth of stock held in trust had been sold out which had belonged to different individuals, and the proceeds applied to Mr. Wright's speculations, without his following the legitimate business of a banker. The value of his shares was continually fluctuating, and his purchase of them was improperly made by the money of his creditors. For all this no justification could be offered, and, according to the obligations imposed upon me by the act of Parliament, I cannot pass such matters over, although in doing so I am acting in some degree against my feelings. In my situation, however, I must lay all consideration of my feelings aside, and perform my duty to the public." The case was therefore adjourned for a month.

The Art-Unions of the Metropolis.—On Saturday evening, a meeting of artists, resident in the Metropolis, took place at the Freemasons' Tavern, the object of which was to contradict an assertion put forth by a new society, called the National Art-Union, stating that it had received promises of support and co-operation from artists generally. The chair was taken by Mr. T. Wyse, M.P., and the room was crowded. A resolution, contradicting the above assertion, moved by Mr. Fahey and seconded by Mr. Clint, was carried unanimously. Another resolution, complimenting the Art-Union of London, proposed by Mr. Warren and seconded by Mr. Park, was also carried, but not without a show of opposition; some persons objecting to certain parts of the management of the committee of the Art-Union, in regard to the remissness in the delivery of the prints to the subscribers, the selection of the subjects, and the execution of the engravings; while others objected altogether to the constitution of Art-Unions, on the principle of their being a lottery. The sense of the meeting was, however, almost unanimously in favour of the resolution, which was accordingly carried. Subsequently to this meeting, the National Art-Union has issued a circular, attributing the proceedings of the meeting to the announcement in their prospectus, that no prizes will be selected by the new society of less value than 25*l.*; a regulation, they state, which excludes a large class of persons who paint pictures of a low price expressly to meet the demand of the Art-Union prizeholders.

The Scottish Monument.—On Saturday, the Marylebone Vestry assembled for the purpose of adopting one out of three designs, selected by the committee, for erection in the Regent's-circus to the memory of the Scotch Reformers of 1793-94. A memorial was presented praying that the designs should be open to competition, but the motion for the admission of the memorial was lost by a large majority. It was then resolved, with seven or eight dissentients, that the design for a plain square pillar, about 40 feet in height, with a cap of a Roman pilaster, surmounted by an urn, be adopted by the vestry; and a committee was appointed to assist Mr. Hume in superintending its erection.

Public Meetings.—On Wednesday evening, a meeting of the Fourth Section of the Anti-Corn-Law Association was held at the Marylebone Institution. The hall was completely filled, there not being less than 700 persons present. The chair was taken by Mr. Henry Waymouth, who stated at some length the object of the meeting, and alluded, in the course of his speech, to a statistical return which he held in his hand, and which, he said, placed in a strong light the sufferings of the once happy operatives of "Merry England." It showed that in Wigan, in Lancashire, there were, on an average, 981 in full employment at 1*s.* 7¾*d.* per head per week, or 2¾*d.* per day; which, if wholly laid out in bread, would be 1 lb. 6 oz. for each. There were 1,720 persons whose income did not exceed 1*s.* per head per week; 2,330, 1*s.* 6*d.*; 1,768, 2*s.*; 1,786, 3*s.*; 538, 4*s.*; 1,133 whose income was 5*s.* and upwards. There were 2,745 who slept three in a bed; 1,852 who slept four in a bed; 830, five in a bed; 503, six, seven, and eight in a bed; and there are many having no beds. Of these beds, a great majority are very inferior, made up of straw, shavings, &c.; many having no bed-clothes. Great numbers have no change of linen, and many have no linen at all. He therefore considered it absolutely necessary that the Metropolis should second the efforts of the people throughout the manufacturing districts in putting an end to these laws. Mr. M. Gibson, M.P., in a speech of some length, moved the following resolution:—"That all restrictions on the interchange of commodities are injurious to the community by limiting trade, enhancing prices, and diminishing the demand for labour: evils which press most heavily upon all, but most severely on the poorer and labouring classes." Col. Thompson moved a resolution—"That with the view of securing this repeal ere it be too late, this meeting pledges itself to co-operate with the Anti-Corn-law League in its just and righteous object, and to use all its energies to obtain for the suffering people of this realm the right, of which an iniquitous legislation has deprived them, to exchange their labour for their bread." The meeting was then addressed by Sir De Lacy Evans and other gentlemen, and the above resolutions were unanimously adopted.—A special general meeting of the New Brunswick and Nova Scotia Land Company was held on Thursday, to take into consideration the present position and future prospects of the Company. The report stated that the result of the meeting lately held for the purpose of considering the arrears of call regulating the Company's capital, had been the forfeit of 26,000*l.* stock; the amount in arrear which could not be recovered being 6,566*l.*, and the payments made by the various holders 13,072*l.* The total capital of the Company now amounted to 171,950*l.* A call, at the rate of three per cent., would, however, be required to repay the loan to the bankers, and to complete the final instalments on the purchase money. Should the proprietors authorise the directors to continue both the home and colonial establishments, the liabilities of the Company for the year ensuing would be between 6,000*l.* and 7,000*l.* In compliance with the wishes of the proprietors the board had reduced the salaries and general expenditure of the establishments at home and abroad, so as to bring the whole within the sum of 1,254*l.* From the recent advices received from the Company's superintendent at Stanley, it appeared that the settlement of farmers and artizans in the New Brunswick district was daily on the increase, in consequence of which new roads were being formed, and fresh accommodation furnished. The sales of land, which had been effected up to the 1st September, amounted to 2,770 acres, at the rate of 5*s.* per acre, upon which 1*s.* deposit was paid by the settlers. Recently a convenient site had been set apart in the company's territory for a church, in connexion with which a clergyman of the Church of England had been ordained by the Bishop of Nova Scotia. It was to be expected that when the terms of the Ashburton treaty came more fully into operation a great increase in the sale of land would take place, and greater facilities for emigration be established. The entire stock of crops and of cattle on the company's farms were in a healthy and favourable condition. A tax of 1*d.* per acre had recently been imposed by the Legislature of Upper Canada upon all uncultivated lands. It was then proposed by Mr. Bruce, and seconded, that the report of the directors be received and adopted. To this an amendment was proposed by Mr. Pouncey, but which fell to the ground from want of a seconder, to the effect that no expenses be in future incurred which could not be met by the company's income. The original motion was then put and carried unanimously.

Police.—For some time past the attention of the magistrates has been directed to a shop in Holywell-street, kept by a man called Patterson, in which books and prints calculated to bring religion into contempt have been openly exposed for sale. Last week the question came before the magistrate at Bow-street, in consequence of Mr. Knight Bruce, son of the Vice-Chancellor, having broken the glass of the shop-window, in order that the police might have the particulars before them in an official form, and be thus enabled to bring home the offence to the parties concerned. The magistrate applauded Mr. Knight Bruce's conduct, and merely sentenced him to pay the cost of the glass. On Tuesday, Mr. Green, the merchant, of Dorset-place, appeared at Bow-street, to answer the charge of tearing down and removing a written paper from the same window. Mr. Green stated that he had three times requested the boy in the shop to remove them, and, as he refused to do so, he had himself torn them down. He was then given into custody on the charge of theft. The magistrate said there was no difficulty whatever about the nature of the charge, for it was not at all like a theft, the object of the accused being only to take down the papers, in order to bring the subject into a state of prosecution. If Patterson had to complain of anything, he might, if he thought proper, bring an action for trespass; but as it was evident that Mr. Green had no intention of committing a theft, he should not have been taken into custody on such a charge, and the case must therefore be dismissed. On Wednesday, Mr. Pearce, a corn-merchant, appeared at Bow-street to answer a similar charge; but the magistrate refused to receive the evidence of Mr. Patterson's witness, and the gentleman was discharged. In consequence of these transactions, the Government have at length determined to put down the shop as a public nuisance. It is said that Mr. Maule, the Solicitor to the Treasury, has received instructions to proceed against the parties, and is now engaged in making the necessary arrangements.

Hanwell Asylum.—At the meeting of Middlesex Magistrates last week, the management of the Lunatic Asylum at Hanwell was taken into consideration, in order that the Court might pronounce a final resolution as to the system of treatment which has now for three years been in practical operation. The resolution passed last year on the subject was in guarded language, so as not to commit the court absolutely to its support. Mr. Laurie now stated that since the introduction of the present system they had had 1,000 patients on an average annually in the asylum, and yet the periodical reports were one unvaried record of success. After a practical experiment for such a length of time without the occurrence of one untoward event, it was due to the public to record a definitive opinion as to its merits. He, therefore, proposed a resolution, "That having taken into consideration the reports of the visiting justices and resident physician of the County Lunatic Asylum, laid before the court on the 27th Oct. last, this court desire to record their opinion, that after a trial of three years, the advantages of the total abolition of personal restraint in the treatment of lunatics, as maintained in that asylum, are fully established on the firm basis of practical experience, and to express their gratification at the success which has attended so great and beneficent a scheme for the amelioration of the condition of the most afflicted class of the community." After going through some details as to the humane and conciliatory mode of treatment now pursued in the asylum, he said that during the past year 16,984 articles of various kinds had been manufactured by the patients, in addition to performing the washing, cooking, &c., of the establishment. The rate of mortality amongst them was comparatively at a low average. The per-centage of deaths since the asylum opened was 12 per cent.; but recently it had diminished to 9 per cent., which was to be attributed to an increase of diet and comfort. The expenditure caused by this treatment might appear to be greater, but in reality it was the reverse, as it tended to cure more quickly, which proportionably diminished the expense. Mr. Tulk said, that during the four years since the adoption of the non-restraint system, not a single instance of a calamitous kind, fairly attributable to that mode of treatment, had occurred. He hoped that means would be taken to erect a smaller asylum in the neighbourhood for convalescent patients, which would facilitate the cure of those approximating to convalescence. He was also persuaded that there ought to be no private establishments for the insane. The chairman (Mr. Serjeant Adams) expressed his opinion, that it would be beneficial were one uniform system of making out the statistics of lunacy adopted generally in all the asylums throughout the kingdom. A Government measure was required for that purpose, and he expected some beneficial enactments on this subject. Sir Peter Laurie said that they had taken the poor lunatic under their protection, and now they would see if they could not do something for the rich. He could assure them, that many in the higher ranks of life were becoming sensible of the superior advantages of public asylums; and he had been frequently privately applied to to get insane persons of condition into Bethlehem, with an offer of 300*l.* or 400*l.* a year. There was wanted a kind of self supporting institution for the insane, which should be got up by public subscription. At the present day, Hanwell was the only place where the poor were better off than the rich. He had examined the system practised there, and all his former prejudices against it were entirely removed. Several other magistrates bore testimony to the complete success of the Hanwell system, and the resolution was unanimously adopted.

Southwark.—A long statement has been published by the managers of the parochial schools in this borough in reference to a performance of sacred music which had been advertised to take place in St. Saviour's Church. It appears that it was the intention of certain inhabitants of the parish to give a performance of sacred music in that church for the benefit of the parochial and national schools. That intention having been communicated to the Bishop of Winchester, his Lordship has commanded that no such performance shall take place. The Bishop's letters state that the annual rehearsal and performances at St. Paul's for the benefit of the sons of the clergy are very different from the proposed concert, and that "with the minister alone, subject of course to his responsibility to the ordinary, is the right of exercising his discretion as to the allowing the use of the church for any meetings, except the customary meetings for vestry for parochial business. The minister has a perfect right to refuse the use of the church for such a performance as advertised; and has not only a right so to do, but it is his bounden duty. The churchwardens have no power to grant the use of the church." In consequence of this prohibition the managers have refused to give the performance in any of the taverns in the borough, and have consequently abandoned it altogether.

Hackney.—On Thursday a meeting was held in this parish to make a rate for the ensuing year. After the vestry-clerk had read the estimate of the rate, from which it appeared that the proposed repairs amounted to 65*l.*, and the amount to be collected 288*l.*, the churchwarden, Mr. Gillespy, moved, "That a rate of 2½*d.* in the pound be granted." Mr. G. Offor addressed the meeting at some length. He complained of the impropriety of fixing upon this period of the year for the agitation of a church-rate question, and moved that the estimate be not received. The churchwarden said that in asking for a rate he was only paying due allegiance to the law. He had no doubt of the legality of asking for it—the legality of withholding it was another question. He hoped to see none of those unhappy differences which all parties regretted when free from the excitement produced by them. The proceedings of the meeting proved that a kindly feeling had supplanted much of the bitterness of former years; and he should not prevent an increase of that feeling when he stated that he was not desirous of exacting the rate from any one whose conscientious scruples forbad the payment of it. This announcement was received with satisfaction, and upon the motion for a rate being declared carried, Mr. Offor declined to demand a poll, expressing his opinion that after the explanation of the churchwarden, the rate was virtually a voluntary one.

Woolwich.—The Shearwater steam-vessel, which has been for some time employed in the survey of the German Ocean, has arrived at this dock-yard to refit, and it is expected that Capt. Washington will commission either the Blazer or the Flamer, to carry on the duties of the survey next season. The Wilberforce steam-vessel has been taken into dock, to have the injury which she sustained in her bottom, by striking on a rock, in going up the Niger, repaired. It is stated that when again ready for sea, she will be recommissioned by Capt. Wm. Allen, who is anxious to proceed again to Africa, and that her chief occupation on that coast in future will be as a surveying vessel.

Richmond.—It is stated that the amount of Captain Belstead's defalcation, occasioned by his fraud on the Richmond Savings-bank, amounts to no less than 1,500*l.*; the whole of which the trustees have determined to make up, so that the depositors will sustain no loss. It is also stated, in reference to the system of management, that instead of "the Manager's book" being an effective check upon that of the Secretary, the former was copied from the latter, thus preventing the possibility of detection by the most direct means, and also preventing further investigation, if any apparent discrepancy arose upon examining any other documents or books of account. The King of Hanover and the Duke of Cambridge, who have both been patrons of the bank, have subscribed, the former 100*l.* and the latter 50*l.*, towards making up the loss.

Mortality of the Metropolis.—The number of deaths registered in the week ending Dec. 10, was 815—Males, 409; females, 406. Weekly average 1838-9-40-1—Males, 467; females, 445. The distribution of this mortality was as follows: West districts, 103; North, 156; Central, 151; East, 202; South, 203.

Provincial News.

Agricultural Districts.—On the 8th inst. the barns, stabling, and outhouses on the estate of Mr. Denison, M.P., at Dorking, in Surrey, were fired and destroyed, together with a number of wheat and hayricks, several valuable horses, and a quantity of poultry. Mr. Denison has offered a reward of 100*l.*, the inhabitants of the town and neighbourhood of Dorking 270*l.*, and the Government 100*l.*, for the apprehension of the incendiary.—On Tuesday evening two wheat-stacks in the rick-yard of Mr. York, at Peacock Farm, at Lower Morden, in the same county, were fired and burnt to the ground. The stacks contained from 12 to 20 loads each, and were standing in the centre of a yard containing a great number of other ricks, which would have been destroyed but for the arrival of several engines from the metropolis and the surrounding villages. The total loss is expected to exceed 2000*l.* About a week since two ricks were fired in a neighbouring farm belonging to Mr. Aspin.—On Sunday night, the farm of Mr. Hine at Newnham, near Baldock, in Hertfordshire, was fired, and the rick-yard destroyed, containing corn valued at 2,000*l.*, about 400 quarters of wheat, and a large quantity of clover-seed, which, with other corn, would have found employment for thirty men through the whole winter.

Barnstaple.—The annual cattle-show took place in this town on Friday last. At the dinner which followed, Lord Ebrington presided, supported by his father, Earl Fortescue, who addressed the meeting as Lord Lieutenant of the county. He hardly need, he said, upon this occasion, repeat the opinions which he had always advocated, that, in the great and mixed community of which this kingdom was composed, the prosperity of every interest depended upon a union of the whole. It was no part of his duty, and foreign to the object of these meetings, either to praise or condemn the principles by which such measures were carried out—it was sufficient for us to know that they had now become the law of the land, and by them our relations with other countries must be directed. But he would boldly state, with respect to their mingling political with agricultural discussion, that we ought, as wise and prudent men, to hold ourselves ready for further regulations for the admission of foreign corn. He did not take his opinion on this subject simply from the distress that prevailed among the manufacturing population of the kingdom; but he thought they must look in the next session of Parliament for further relaxation in the laws for the admission of foreign corn; and he would ask those who were in the habit of watching the political horizon, whether they were not themselves prepared for further changes? His Lordship alluded to the late agricultural meetings which we have noticed in preceding Numbers, and particularly dwelt upon the speech of Mr. Acland at Yeovil. He expressed the satisfaction he experienced at finding that those sound and just principles which he had always advocated were supported by a gentleman for whose opinions he not only entertained sincere respect, but who, not twelve months ago, was of a different opinion—a gentleman, from the part he had taken in agricultural questions, to whose opinions he would attach more weight than to his own. When he saw such intelligent persons as this throwing aside their former opinions, might he not safely argue the probability that greater alterations would take place in the introduction of foreign produce? It was their duty, at least, to be prepared for further changes in this respect. In regard to rents, his Lordship said he was the last person to deny that it was the duty as well as the interest of the landlord to apportion the rents to the circumstances of the times. He felt satisfied that the exaction of exorbitant rents was both an injustice to the landholder, and ruinous to the occupier. At the same time, however, when he said this, he could not say that a general reduction of rents, to any great extent, would successfully resist the competition of the foreigner. It had been proved, by experience, that the lowest rented lands were not always the best cultivated; unduly low rents, he feared, too often took from the tenant that stimulus to exertion which was absolutely necessary; the landlord, in consulting the interest of the tenant, would best consult his own interest by going hand in hand with him in draining, fencing, and in every other mode of improving the lands they held. He believed, if that course were generally pursued, the productive powers of the land would be best developed—he believed, that by means of giving additional employment to the labourer, and his labour being most beneficially adapted to the land, the interest of all classes would be consulted, and they would have nothing to fear from any competition that may be produced by changes of the law.—Lord Ebrington then addressed the meeting, and said, that the English farmer had no reason to fear the introduction of foreign produce. The question, he thought, was whether they were to give up farming altogether, or whether they would follow the new lights that were rising up for the improvement of the soil. If they followed the rules pointed out for their guidance by the Royal Agricultural Society, he did not see that they need despair of successfully competing with the foreigner—he did not say that we should be enabled to expel foreign produce from our markets, but we should try to make our own produce the best.

Bath.—The trustees of the Bath roads having had the tolls in their own hands for more than a year since the completion of the Great Western Railway, have determined on again letting them. The funds of the trust, it is said, have not suffered so much by the loss of travelling as was expected, and there will be a considerable sum left for the gradual reduction of the debt after paying all the expenses of the roads.

Brighton.—An experiment is now in progress at the head of the Chain-pier, for the purpose of raising fresh water from below the sea by means of an Artesian well. It is intended to bore to the extent of 70 feet, at which depth it is expected that the chalk formation will be penetrated, and fresh water obtained, which will be applied to the formation of a fountain.

Carnarvon.—In reference to the proposed union of the two bishoprics of North Wales, which we noticed under this head last week, we learn by the *Oxford Herald*, that in a recent communication with his Archdeacon, the Bishop of Oxford has strongly urged the expediency of representing the serious evil which will be inflicted on the Church in Wales, if the contemplated union of the sees of Bangor and St. Asaph should ever be carried into effect.

Cheltenham.—The local papers state that a poor man named Coldwell died in that town on Saturday last from actual destitution. From the evidence on the inquest, it appeared that deceased had been long out of work, and subsisted by the kindness of neighbours almost as poor as himself. On Saturday he attended prayers at the Catholic chapel, and was found in a kneeling posture, immediately after the service, a corpse. At the inquest on Monday, the jury returned a verdict that he "Died from want of the common necessaries of life."

Chester.—On Wednesday week, a meeting was held in this city for the purpose of presenting Lady Anne Wilbraham with a portrait of her husband Mr. George Wilbraham, late Member for South Cheshire. The portrait was painted by Sir M. A. Shee, President of the Royal Academy; and the inscription stated that it was presented by the supporters and friends of Mr. Wilbraham, "as a memorial of their gratitude for the zeal and ability with which he advocated their interests, and in admiration of the integrity and manly independence which characterised his political conduct during the ten years he represented them in the House of Parliament." The meeting was very numerously attended, the picture being presented by Lord Robert Grosvenor. In the evening a dinner took place, at which Mr. Wilbraham reviewed the different topics which had engaged the public attention while he was their representative. It appears that the idea of presenting the portrait originated with the yeomanry in the neighbourhood of Sandbach, and that a large proportion of the donations received were from persons in a humble station who were anxious to contribute to the testimonial.

Devonport.—A Conservative dinner took place in this town on Tuesday, the Mayor, Mr. J. Smith, presiding. The meeting was attended by Sir J. Y. Buller and Lord Courtenay, two of the county members, and other gentlemen. Sir J. Buller in his speech dwelt on the revival of trade, and considered that commerce would not fail to derive benefit from the recent measures of the Government. Lord Courtenay said that the financial schemes of the present Ministry must be useful to all the interests of the country, and do as little injury as could possibly be done to interests affected by them. Mr. C. B. Baldwin, M. P. also stated his belief that the measures of the Government in regard to the corn-laws and the tariff were wholesome and beneficial to the country, and that they would bring about a proper state of things. The wars, he said, in which the country was engaged having ceased, the national finances have been relieved from some degree of oppression, and he hoped that the income-tax would not be continued longer than the specified time. He considered it probable, that it might be removed before, for he was assured that Sir Robert Peel would take the earliest opportunity of repealing it. Several other gentlemen addressed the Meeting at some length, but the interest of their speeches was chiefly local.

Isle of Wight.—The annual cattle-show took place at Newport on Thursday the 15th, and was followed by the customary dinner, at which the Earl of Yarborough presided, supported by about a hundred gentlemen. His Lordship's speech consisted chiefly of a comparison between the agriculture of Lincolnshire and the North of England, and that of the southern counties. He noticed the length of time stock was kept, and observed with reference to fattening that the motto should be, "Short time and quick returns." In regard to the necessity of further exertion on the part of the farmers, Lord Yarborough concurred in the speeches of the agriculturists whose opinions we have lately had occasion to record. "The farmer," he said, "as well as the grazier, must look for quick returns; and if the present times last, they must use greater industry—imitate the Scotchman—go and think, and turn everything into money they could; for if they stand still they go back." This improvement he considered necessary in all classes connected with agriculture in the Isle of Wight; for although he admitted that they were improving, they did not advance so much as he desired, nor so rapidly as their neighbours. "He was anxious," he said, "about their labourers, they must get them into a quicker pace; if the horses want to go faster, they won't let them; they want horses that will step out, and the men should keep up with them. In the north there was scarcely such a thing as a day labourer, most of the work there is done by the piece. Here the labourer sauntered with his hands behind him; but in the north their very elbows went before them, and they say 'We shall begin an hour earlier and work two hours later, for we shall be paid for it.' But here a young fellow says, who is on the day-labour system, 'I don't see why I should exert myself more than an old man, for I get no more.' It was not by discharging the labourers that farmers would save money. Let JOHN be employed, and you will get something from his labour. He did not say this because many were out of employ. If it is necessary to reduce wages, do it; but do not do it in a hurry, lest you fall into the same evil as the manufacturers did. They did it suddenly, and the men rose up against them. Landlords and tenants must put their shoulders to the wheel, and then they had nothing to fear."

Leicester.—On Tuesday, the 13th, a hundred deer were caught in Garendon-park, the seat of Mr. C. M. Phillips, for the purpose of stocking one of her Majesty's parks with the breed, which is considered a fine one. The park was crowded with visitors, who had collected from the towns and villages in the neighbourhood to witness the sport. A large space, between 400 and 500 yards in circumference, had been enclosed by high netting attached to the trees; the deer being driven into the enclosure, were frightened by the shouts of the men employed to catch them, and plunged into the nets with a view to break through, when they were entangled by the legs or neck, and caught without difficulty. They were then conveyed in vans to the Hall stables, and have since been removed to Windsor.

Liverpool.—A case of some interest to commercial men both in this country and the United States came before the Court of Bankruptcy in this term on Saturday. The bankrupt is a person of the name of Hall, formerly a grocer at Warrington, and reputed to have been well educated, and to have strong religious tendencies. It appears that in the month of September, 1841, he absconded from Warrington, and was subsequently discovered to have sailed for America, leaving his affairs perfectly unprotected, but without any effects available to his creditors, either from a secret disposition of them prior to leaving, or by some fraudulent negotiations with other parties, for the purpose of keeping the proceeds from his creditors. The father-in-law took possession of the books, and on the bankrupt's arrival in America, he obtained an appointment as clerk in a grocery store, where he evinced activity and vigilance for a twelvemonth, as described by his master in his advertisement of the robbery in the American journals. On the 19th June last he absconded from his master at Brooklyn, in the State of New York, taking with him 4,950 dollars, the moneys of his employer, in Texian Treasury notes and specie of different denominations. Every attempt to discover his retreat was unavailing, and shortly afterwards the bankrupt appears to have had some connexion with a Mr. Thomas Montfort, in South Boston, from whom he also absconded, taking with him 1,200 dollars current money of the state. Mr. Montfort immediately advertised the prisoner, offering a reward of 300 dollars for his apprehension, but without effect. The bankrupt contrived to elude the vigilance of the police in the United States, and nothing more was heard of him until information was received that he had been seen at his old haunts at Warrington. He was there apprehended, and brought before the magistrates to answer the charge of felony preferred against him from his American prosecutors by attorney; but the case was so beset with difficulties, in consequence of the indeterminate relations between the two countries on the point of arrest, that Colonel Aspinwall, the United States' Consul, and Mr. Nicholson, clerk to the magistrates at Warrington, applied to Sir J. Graham for advice in prosecuting the examination, which proved ultimately an affair of so much difficulty as to cause Sir J. Graham to recommend an abandonment of the case—a recommendation which was instantly followed by the release of the prisoner, but not of a restitution of the property, either to the prisoner himself or to the parties deputed by the assignees under his estate for their joint benefit. At the examination on Saturday, it appeared that the books left behind when he first absconded had been much mutilated, and the bankrupt stated that he could not produce a balance-sheet. The Commissioner said, that without such a document, giving a clear statement of his affairs, he should refuse to pass him, and the inquiry was accordingly adjourned.—Another destructive fire broke out in this city on Thursday morning, on the tar and rosin works of Messrs. Platt and Son, at the south end of Liverpool. These works are very extensive, having fronts to four streets, and occupying a space of nearly 700 square yards. The tar and rosin works are in the centre, and at each end are ranges of lofty warehouses, filled with general merchandise. The fire, from the combustible nature of the materials on the works, soon got head, defying all the exertions of the fire-police to arrest its destructive progress. The state of the wind greatly contributed to spread the flames. There was a strong breeze from the south-east, which, blowing right across the river, carried the flames in a body from the tar and rosin works to the range of warehouses at the east end, while the intense heat fired those at the west end. The result was, that by 8 o'clock the whole was one mass of ruin. Meanwhile, the dwelling-houses on all sides of the burning pile were exposed to imminent danger. The neighbourhood is densely inhabited, and the alarm of the inhabitants was very great. While they were removing their furniture, the fire-police, despairing of arresting the career of the fire in the tar and rosin works, played on the houses. The whole of those in New-hall-street were, however, destroyed, and others in Greenland-street were seriously damaged. A school belonging to the congregation of Great George-street Chapel was held in the lower room of one of the warehouses in Greenland-street, and was, of course, consumed, with all its books and furniture. The fire appears to have been caused by the boiling of turpentine early in the morning. Two men in one of the warehouses escaped from burning by descending by the jigger-rope, the stairs being on fire. No estimate has yet been formed of the property destroyed. The warehouses contained wheat, flour, and cotton. The flames in the contiguous premises were not subdued for several hours, as the breeze from the south-west continued to spread the flames.

Norwich.—The local papers inform us that Mr. Dickinson is on a visit to this district, commissioned by Government to inquire into the state of the women and children employed in agriculture, with a view to ascertain their actual state, and its relation to that of the same portion of the manufacturing and mining classes. His inquiries tend to all the points connected with their food, wages, education, habits, and situation—embracing, indeed, all the circumstances that can affect their moral and social condition.

Nottingham.—It appears by the Nottingham papers that fears are entertained for the safety of the massive tower of St. Mary's Church in that town, and that one of the piers by which it is supported has shown indications of giving way. The churchwardens have consulted Mr. Cottingham, the architect, on the subject, and an examination will be instituted into the real condition of the building. The weight of the tower is estimated at 2400 tons, and divine service has been suspended until the survey has been made.

Shrewsbury.—The funeral of the late Lord Hill took place on Friday, in the chapel at Hadnal, within five miles of this city. The shops were nearly all closed, as a token of respect to his Lordship's memory. Although the morning was gloomy, with continued drizzling rain, hundreds of persons started at an early hour, on foot, to Hadnal, followed by horsemen and vehicles of every description; and throughout the morning the entire route was crowded with people anxious to witness the last obsequies of the deceased, who was universally beloved in this neighbourhood. To add to the affliction of the family, Mrs. Hill, the mother of his Lordship, expired on Saturday morning, after a severe illness.

Stafford.—The free-trade meeting in the Potteries for the purpose of receiving a deputation from the Anti-Corn-League, took place at Shelton on Thursday the 15th, Mr. Ridgway in the chair. About 1,500 persons were present. On the seats in front of the platform were 200 ladies, comprising members of many of the principal families in the neighbourhood. The deputation from the Anti-Corn-law League consisted of Colonel Thompson, Mr. Cobden, M.P., Mr. Bright of Rochdale, and Mr. Moore of Manchester. The meeting was addressed by several gentlemen at great length, and several resolutions in favour of the League Fund, pledging the meeting to use every exertion to obtain a repeal of the Corn-laws, were adopted.

Sunderland.—In our Paper of the 3d, we stated that it is the intention of the commissioners of the river Wear to convert the harbour of Sunderland into a floating-dock, and that notice had been given of an application to Parliament for powers to carry this scheme into effect. On Monday, a public meeting of the shipowners of the port was held for the purpose of taking the subject into consideration. It was stated, that when the proposed dock is constructed, loaded vessels will lie at all times afloat, the channel of the harbour will be deepened, and the disastrous consequences which have heretofore resulted to shipping by the breaking up of the ice, which caused 20,000*l.* damage in the beginning of 1841, will be averted. The expense is estimated at 60,000*l.*; the tax on shipping will be 1½*d.* per ton per voyage; and a tax is also to be levied on the shipment of coals and the import of some descriptions of merchandise; and from these sources of income the commissioners intend to reduce the debt 4,000*l.* every year. The proposal was unanimously adopted, and a committee appointed to superintend the progress of the Bill.

Thetford.—It appears from the Norfolk papers that the solicitor who has absconded from this town, as mentioned in our Paper of the 3d inst., is Mr. Henry Rogers. It is said that since his flight he has addressed a letter to a gentleman, stating that his liabilities amount to 15,000*l.* He had mortgaged his house seven times without recognition of the previous charges; had obtained from a butcher in the town 1,000*l.* on a parcel of old leases and other parchments of no value; had similarly duped a gentleman of 2,000*l.*, the guardian of some children of 600*l.* trust-money, and others of sums varying from 400*l.* to 1,000*l.* each. He had also deposited at the National Provincial Bank a bond for 200*l.*, to which the signatures of his father and brother had been forged; and it is mentioned as a singular fact, that one of the pretended securities is dated in 1838, the stamp on which it is written being dated 1839. As an instance of the confidence placed in him, a letter, opened since his flight, announces the writer's intention to bring him 1,200*l.* on a day named, to be disposed of as he should think proper. Shortly before his departure, he obtained 25*l.* from the waiter at the Bell Inn, Bury, under pretence of having left his pocket-book at home; and even, in his flight, obtained cash upon his check for 15*l.* at Newcastle. A meeting of creditors has been held, which was attended by numerous parties from this district of Norfolk; but there appears to be little chance of recovering any portion of their property.

Worcester.—The ratepayers of this county are arranging a strong opposition to the rural police. Petitions are preparing in various parts of the county for presentation at the next sessions, and six magistrates in the Kidderminster district have given notice to the clerk of the peace that they will move an address to the Secretary of State from the justices of the county, that the continuance of the police force is no longer necessary, and that it is desirable to return to the old system of superintendents and constables, appointed by the different parishes for their own benefit.—The *Worcestershire Chronicle* states as a fact, that in a first-rate inn, not 14 miles from that city, the sum of 9*d.* was all that was recently taken in one day, and that the receipts of two days were not more than 7*s.* 6*d.* The farmers, it states, seem panic-struck, fearing in many instances to spend even a sixpence in luxury; and multitudes of labourers are out of employ, while those in work have to submit to reduced wages. It adds, that upwards of 60 able-bodied men lately applied for relief or work to the Board of Guardians of an agricultural union in that county; and that a man stated before the county police court that he was turned out of his employ because he would not thrash wheat for 13*d.* a-day.

York.—The restoration of the Minster is proceeding satisfactorily. A new roof has been put on the north transept, and the walls which had been bulged by the pressure of the decayed roof have been brought in about three inches. The new roof is to be ventilated and lighted for the better preservation of the timbers, and covered, first with kyanised deal boarding, and then with copper sheeting.

Railways.—The following are the returns for the past week:—Newcastle and Carlisle 1,153*l.*; Liverpool and Manchester 3,737*l.*; Great Western 11,074*l.*; South-Western 4,350*l.*; Birmingham and Derby 1,134*l.*; Birmingham and Gloucester 1,384*l.*; Hull and Selby 857*l.*; Grand Junction 6,048*l.*; Great North of England 1,182*l.*; Midland Counties 2,213*l.*; Manchester and Birmingham 2,034*l.*; Manchester and Leeds 1,501*l.*; North Midland 3,816*l.*; York and North Midland 1,304*l.*; Blackwall 499*l.*; Brighton 2,921*l.*; Croydon 203*l.*; Eastern Counties 833*l.*; Greenwich 736*l.*; Northern and Eastern 1,335*l.*; London and Birmingham 13,379*l.*—On Thursday the 15th an accident occurred in the station-yard of the Midland Counties railway. The Derby train was coming into the station-yard, when the engineer discovered he could not turn the steam off without delaying him so long as to cause a concussion. He immediately jumped off, after turning the steam handle completely back, and the engine ran with great violence against a coal-waggon near the wooden barrier. The immense beams were split asunder; the coal-waggon was lifted off the line and forced through the wall of the ticket-office. There were several passengers in the train, but they escaped without injury.—The Cheltenham stag-hounds, on Tuesday, had a narrow escape of adding another item to the catalogue of railway accidents. The stag had given its pursuers a smart run round the town, and crossed the railroad near Badgeworth, just as one of the Gloucester trains came up. The first dog of the pack was killed, and the rest were descending the cutting in full cry; but the train was going at a rapid rate, and passed before they had time to cross the rails. The dogs were closely followed by a numerous field.—At the Middlesex sessions, on Friday, Mr. George Elmore, an architect, was indicted for having broken two locks on the gates of the London and Birmingham Railway, near the Harrow station, on the 17th Oct. It appeared that on the day in question, the Messrs. Elmore, father and son, and another gentleman, were following a pack of harriers, and coming upon the line of the Birmingham Railway, the elder Mr. Elmore pulled up, and did not attempt to cross; but the younger Elmore, a lad of 16 years of age, and their companion, also a youth, dismounted and forced open a gate opening upon the line, and crossed over. The directors had felt it their duty to the public to institute a prosecution; but as the party complained of had acknowledged his error, and was willing to plead guilty, they did not press for more than a nominal sentence. The chairman said, that as this was the first case of the kind, and the party a very young man, the court would acquiesce and act upon the recommendation of the directors; but it should be publicly known that such acts could not be repeated with impunity. Mr. Elmore then paid a fine of 1*s.*, and was discharged.—The works of the South-Eastern Railway, along the cliffs between Dover and Folkestone, continue to progress as rapidly as the rugged course of the line will admit. Preparations are now making to throw down, by blasting, a large portion of Rounddown Cliff, immediately beyond the Shakspeare Tunnel, to make way for the sea-wall. On Thursday and Friday night experiments with the galvanic battery, for igniting the blast, were tried by the miners below the cliffs, between Arch Cliff and Shakspeare's Cliff, under the superintendence of Lieut. Hutchinson; and it is said that Colonel Pasley, who conducted the operations on the wreck of the Royal George at Spithead, will also be present at the blasting of the Rounddown Cliff, which is expected to take place in a week or two. This blast will be effected by the force of 18,000lbs of gunpowder, to which the electric spark will be communicated by wires 1,000 yards in length. The experiments on both evenings were satisfactory in their results; and it is said that they will be repeated several times previous to the grand blast.

IRELAND.

Dublin.—It is announced that Dr. Daly, who was so lately admitted Dean of St. Patrick's, is to be the new Bishop of Cashel and Waterford; and that Archdeacon Pakenham, Archdeacon of Emly, and brother-in-law to the Duke of Wellington, will be appointed to the Deanery of St. Patrick's.—The usual half-yearly examination of the teachers in training at the National Board of Education was held on Thursday last. Including the schoolmistresses, there were above 90 teachers assembled. The Lord-Lieutenant was present, accompanied by the Countess De Grey. Their Excellencies first inspected the model schools, which were attended by several hundreds of children. After hearing a number of the children examined in different branches of instruction, the Lord-Lieutenant proceeded to the lecture-room, where the teachers were examined, and then addressed by the Archbishop of Dublin, Dr. Henry (Presbyterian minister), and the Right Hon. A. R. Blake, Roman Catholic layman. The Archbishop of Dublin, in his speech, alluded to the attacks upon the National system of education. "There are men," he said, "who talk of the Bible, who have it perpetually on their lips—who glory in it, and yet display a character quite opposite to the spirit of charity and forbearance which it inculcates. Lamenting that this most unchristian spirit should be so prevalent in the present day, when scriptural education is so eagerly defended, he would exhort the instructors of youth before him to have the Bible, not merely in their hands or mouths, but in their hearts. The commissioners of education," said his Grace emphatically, "do not teach more than they practise; for many years they have been defamed and reviled; they have been falsely accused of denying to those willing to receive them those very Scriptures which all present have now in their hands; but they have endured all with firmness, patience, and gentleness. I have been, in particular, as you are no doubt aware," said his Grace, "assailed in the most furious manner—I have been singled out as an object for every calumny and obloquy, yet I have never been intimidated, and never provoked—and, by the blessing of God, I never will."—An inquest has been held in this city on a young man called Lynch, who was found on a limekiln with his throat cut, on Sunday last, at the village of Milltown, near the spot where the Italian boy was murdered some months since. Much excitement prevailed, from the impression that another murder had been committed. The body was identified on Wednesday by the father and brother of the deceased, who reside at Parnell-place, in the suburbs of the city, and are highly respectable persons. The deceased held a situation in the Ordnance Civil Department. His relatives seem to favour the opinion that he committed suicide; but nothing has yet transpired to throw any certain light on the affair. The inquest has been adjourned for further evidence.—The Repeal meeting took place on Monday, when Mr. John O'Connell delivered a lecture on the Poor-laws, in which he adverted to the increasing opposition to the rate, and said that the expense of the support of the paupers was enormous, no less than 30,000*l*. having been assessed in Dublin alone to support only 4,500 paupers. The week's rent was announced to be 119*l*. 15*s*. 8*d*.

Tipperary.—The agrarian disturbances in this part of Ireland have made their appearance on the estate of Lord Stanley. His Lordship's agent, Mr. Bolton, an English gentleman much respected in the neighbourhood, has been served with a Rockite notice of the most violent nature; in consequence of which, he is obliged to have recourse to the assistance of a party of police, who are now stationed at Ballykisteen, his Lordship's residence.

Belfast.—At a meeting of the Coleraine Presbytery, held on the 13th inst., a resolution was passed favourable to the proposition for calling a meeting of the Assembly, in order to express the sympathy of that reverend body with the church of Scotland, and of devising means, previous to the meeting of Parliament, for securing the rights and long-enjoyed privileges of the Irish Presbyterian church.

Skibbereen.—Mr. Kelly, who was lately appointed by the Lord Lieutenant as a stipendiary magistrate in the Skibbereen district, is still co-operating with the resident magistrate, Mr. Gore Jones, in the promotion of measures for the collection of the poor-rate, and the adoption of precautions for the preservation of order, whilst the present excitement continues. His Excellency has also written to Mr. Jones, approving of his conduct during the recent affray, and ordering that gentleman to make inquiry as to the nature and extent of the encouragement given by persons of superior station to the peasantry in the district to resist the collection of the rate. It is stated, that landlords in other districts, as well as in Skibbereen, have urged the peasantry to such resistance; and at a recent meeting on the subject, the Earl of Bandon expressed his belief, that the late outbreak was excited by the unguarded manner in which some of the landlords are said to have expressed their disapprobation of the tax.

SCOTLAND.

Edinburgh.—On Thursday the Lord President intimated to the counsel in the Strathbogie and Auchterarder cases in which Lord Cuninghame has recently given out interlocutors and notes, that there would be a hearing in presence of both divisions of the court in the course of the second week after the Christmas recess—Strathbogie to be first heard. The pleadings will be limited to one counsel on each side of the bar in both cases.—At a meeting of the Town Council of Edinburgh last week, the Lord Provost intimated that certain improvements were about to be commenced in the King's-park—that Arthur's Seat and Salisbury Crags were to be enclosed, and that ultimately a deer-park would probably be formed. Some of the papers observe, in reference to this statement, that the announcement is premature, and that although certain plans have been transmitted to the Commissioners of Woods and Forests, no decision has yet been given by that body.—On Tuesday a meeting of the Edinburgh Town Council took place, to discuss a motion brought forward by Mr. Macfarlan, in reference to the Income-tax. A long series of resolutions was brought forward, declaring the tax to be so inquisitorial, oppressive, and unequal—that no circumstances short of actual warfare, endangering the peace of the country, the stability of the constitution and government, the security of property and the permanence of the established institutions of the realm, can ever justify its imposition—and calling for its immediate repeal on the grounds that the war in India and China is no longer an argument for its continuance. On a division, these resolutions were carried by a majority of 20 to 4, and the Lord Provost's committee were directed to prepare a petition to Parliament on the subject.

The Orkneys.—The Scotch Papers state that a shoal of whales appeared at Scapa Bay on Tuesday fortnight. About 80 of them were captured, measuring from 6 feet to 18 feet, and were sold next day for 214*l*. 20 to 30 boats were employed in the chase, with an average of four men a boat; and the scene altogether is described as most animating, especially at the death. The day was calm and clear. Two or three boats were more or less damaged during the conflict, but no serious accident occurred

THEATRICALS.

Covent Garden.—Miss Adelaide Kemble formally retired from the stage last evening. The opera chosen for her farewell was *Norma*, the first in which she made her appearance before an English audience. On her first entrance, the applause completely overpowered her feelings, and she was scarcely able to proceed. She recovered, however, and went through the opera with an energy which she has seldom before equalled. At the fall of the curtain she was loudly called for, and came forward for the last time to receive the applauses of the house. As she retired, she covered her face with her hands and wept bitterly; the audience seemed to appreciate the impressive character of her farewell, and felt that they had taken leave of the last of the Kembles.

Adelphi.—A burletta called "The Merchant and his Clerks" was produced at this theatre last week. It is an adaptation from the French, and gives the usual history of two clerks, one honest, the other dishonest. The honest clerk is suspected of robbing his master, becomes mad at the unmerited accusation, and is thrown into a lunatic asylum. The real culprit is at last discovered, and, after the received fashion, vice is punished, and virtue rewarded by the restoration of the innocent man to reason and to prosperity, and by the apprehension of the offender. The principal characters were sustained by Mr. Wright, Mr. O. Smith, Mr. Bedford, and Mrs. Grattan. A scene in a lunatic asylum was introduced apparently for the purpose of bringing forward Mr. Wieland, so as to include all the strength of the company. This incident produced marked disapprobation, but the piece was announced for repetition every night, amidst great applause.

Haymarket.—Congreve's comedy of the "Way of the World" was produced at this theatre on Saturday with considerable success. The play was well cast and well acted. Mrs. Glover as *Lady Wishfort*, and Mr. Farren as *Sir Willful Witwoud*, were perhaps the best performances of the evening. Madame Vestris sustained the character of *Millament* with great effect. Mr. Holl appeared as *Mirabell*; and Mr. Buckstone and Mr. C. Mathews were both applauded in their respective parts of *Petulant* and *Witwoud*.—A piece, in one act, translated from the French, and called the "Bastille," was produced on Tuesday, for the purpose of exhibiting Madame Celeste in the character of a Gascon peasant girl, who is beloved by Louis Quatorze, and incarcerated in the Bastille in order that the King may prosecute his suit. Meanwhile the conspiracy of Cardinal Retz is going forward, and the chief actors in that movement become aware of the King's visits to the Bastille. After being again rejected by *Ninon*, Louis is struck with her constancy, and is in the act of writing an order for her release, when he is surrounded by the conspirators. He is saved by *Ninon*, who, availing herself of the royal signet, which had been before given to her with another view, flies from the prison, and summons the King's guards in time to save him from his enemies. Louis evinces his gratitude by giving her a handsome dowry, upon her marriage with her lover, *Fricandeau* (Mr. Webster). The acting of Madame Celeste was much applauded; and the piece was announced for repetition.

Miscellaneous.

Niger Expedition.—A long statement relative to the model farm on the Niger, authenticated by the signature of Lieutenant Webb, commander of H.M.S. Wilberforce, has been published this week, for the purpose of removing some recent doubts whether the farm was a strictly anti-slavery settlement. The following extracts from this document contain the most important facts:—"On the 21st Sept., 1841, the Albert being on the point of proceeding up the river from the confluence, a number of African labourers, principally from Sierra Leone, were left behind at the farm, under a superintendent, whose health, shortly afterwards, obliged him to return to the coast; and several others, in charge of the Amelia schooner moored off the farm, under an African from Sierra Leone, whose conduct appears to have been most unexceptionable throughout. This man, not being directly occupied with the business of cultivation (which, after the departure of the superintendent, was carried on with spirit by a very intelligent American negro from Liberia), spent a considerable portion of his time in visiting the neighbouring villages, for the purpose of conversing with the people, and improving their habits. In the course of these visits, he came (Sept. 29th) to a village called Ajjarah, where he was offered a young lad and a child for sale; the lad was in irons. To the great surprise of the natives, instead of buying them, he remonstrated freely, and, as it would seem, with some effect, against this inhuman traffic. The chief was afterwards warned of his sovereign's (the Attah's) treaty with the English for the suppression of the slave trade; and on the objects of the expedition being recounted to him, is said to have expressed his approbation. He afterwards attended divine service, and seemed much pleased with the little school which was established. A woman was once brought to the farm for sale with a rope round her neck, by the natives, whom the superintendents not only positively refused, but desired the chieftain who brought her, at his peril, to keep her safely till the return of the expedition, urging the threat of the Attah's severe displeasure. The light in which the natives regarded the settlement may perhaps best be shown by a touching appeal which was made to its leaders, several months after they had been left entirely to themselves, by a man whose sole remaining brother was about to be sold as a slave, 11 of his relations having been so disposed of before. To his earnest and repeated supplications for assistance, they were obliged, however, to reply, that they could do nothing for his brother, unless he were brought to the model farm, which was a British settlement. The price of slaves in the surrounding districts they ascertained to vary from 40,000 to 12,000 and 6,000 cowries a-piece (1,000 cowries is there about 4*s*. sterling), and in times of great distress some were sold as low as 300 cowries (about 9*d*.), and children for 10 yams. Several sad accounts are also given of the mode of capturing slaves, and of the cruelties inflicted on them by the Felatahs. The whole country around the model farm, which, from its mountainous character, affords greater security to the persecuted fugitive, is, consequently, filled with exiles, principally Bassa and Kakunda people, who hailed the establishment of the white man in their neighbourhood with delight; not without reason, indeed, for they not only received abundant employment at the farm, but were protected by its very vicinity from their ruthless assailants, and, for the first time in several years, were permitted to cultivate their little plantations in peace. A distinct denial is moreover given to the charge of making slaves of the natives, or driving them with the whip. Some men who were guilty of theft were certainly punished by their own head man, at the request of Mr. Carr, whilst he remained on the farm; and others were subsequently chastised by the hands of their own people for some clear and flagrant offence; but there was decidedly nothing like slave-driving. The labourers invariably received their wages themselves, and their chiefs only got occasional presents for special services, or to secure their good will. The conduct of the people left at the farm appears, indeed, throughout their sojourn there, to have been praiseworthy in all points relating to the slave-trade; but they were in other respects guilty of several improprieties. It must be remembered, however, that on the departure of the superintendent, they were necessarily left under an imperfect authority—a state of things which was certainly not contemplated when they were first sent up—were without a religious instructor, far removed from the eyes of their superiors, and from all the restraints incident to civilised society. As regards the condition of the farm itself, it appears that a quantity of land was cleared for cultivation, especially of cotton, for which the soil was well adapted. The crop was left on the ground at their departure in good condition, and a neighbouring chieftain had instructions to save it, with an understanding that it was to be made a present to himself. No scarcity of native labour was experienced, at the rate of 50 or 100 cowries a day (about 3*d*.), and their whole demeanour is characterised as most peaceable and friendly. The security which the presence of the white man's agents afforded was the means of creating a number of new plantations in the neighbourhood, many refugees having flocked thither for protection. The health of the people at the settlement was good; nor do the leaders appear to have entertained any serious apprehensions for their safety, if left behind. It was Lieutenant Webb's full intention to have left the volunteers (more than half the original number of labourers) at the farm, under the care of Acting Assistant-Surgeon Hensman, who had generously offered to accompany the Wilberforce from Fernando Po; but some sickness having appeared in that vessel, this gentleman could not well be spared, and the consequent arrangements were given up. The surrounding tribes expressed great regret at their departure, and anxiety for their return. Many natives of different parts of the river, located at Sierra Leone, have intimated their desire of going up to settle, should another visit be paid to the site of the model farm."

Eruption of Mount Etna.—The following account of this great eruption, which is now spreading devastation in the neighbourhood of Bronte, is condensed from a letter dated from Palermo, Dec. 1:—"The day before yesterday, passing along the Marina, or public walk that skirts the exquisitely beautiful bay of Palermo, and casting my eye over the range of the Madonian mountains, and beyond the picturesque hills of Termini, I saw resting above the snowy ridge of Etna (which lies literally east of sunrise from here) a long line of feathery whitish cloud, which, from its peculiar tree-like shape, I knew at once to be smoke from the volcano. Accordingly towards night, when the sun had dropped down into the bay of Mondello, a deep-red lurid glare became distinctly visible at the foot of the column of smoke, and all the world was then aware that the volcano was in active operation. This has continued ever since, dimly discernible by day in a pillar of cloud of that peculiar form which an eye experienced in eruptions instantly perceives to be the vapour from a crater—and more conspicuous by night in a body of deep-red fire, of the apparent size of an ordinary haycock, but brightening and lessing fitfully with the swells and lulls of the blast of the fiery furnace. Telescopes have been much in requisition of nights, since Tuesday, and many persons say they see the showers of red-hot rocks rising and falling in the air above the crater, but I myself have as yet seen nothing more than what I have described above, and this is as clearly visible to the naked eye as the outline of the Surrey hills from Highgate. The distance of Etna from Palermo, as the crow flies, is above ninety English miles, and to any one unfamiliar with the marvellous translucency of the Sicilian atmosphere it might seem almost incredible that a mere smoke in the air could be discerned a hundred miles off; yet true it is, that never when on board a steamer have I seen the smoke out of its own chimney more plainly than I see from hence the column rising out of Etna. The height of Etna is the best ascertained of any lofty mountain in the world. Cacciatore, the present astronomer royal at Palermo, and our countrymen, Sir John Herschell and Captain Smyth, the celebrated trigonometrical surveyor, by processes entirely independent of, and unknown to, each other, all fixed it at 10,874 feet English, not differing a fathom in the three computations. So exact a coincidence, in a case in which several compensations had to be allowed for, must necessarily have been partly accidental; but, as Dr. Wollaston said of it, the accident was one upon which no three fools could by any possibility have stumbled. It is worth observing that Etna, which is more than twice as high as Vesuvius, has not half so large a cone of clinkers and ashes at the top, nor is its crater anything like so large or deep as that of

Vesuvius, which latter is in fact quite a model volcano, as if made for show. The present great eruption of Etna (it is at this moment flaming away with undiminished brilliancy and grandeur) is the first that has been visible at Palermo since 1823. Intelligence travels slowly in Sicily, and we have not yet had any authentic advices from the scene of action. The weather is indescribably delicious, like a May of the best quality in England. Sitting on the rocks, the cold hour before sunrise this morning was perfectly pleasant. The flowers and many fruit-trees are in full bloom, and the newly-dropped lambkins are frisking in the fields. I have just seen a letter from Riposto, within fifteen miles of the crater. The hurly-burly began on Sunday night. The smoke that afternoon, and the drying up of the springs, betokened that Enceladus was getting fidgetty; and in the dead of the night the mountain heaved and quivered like the midships of a three-decker, when she pours her first broadside into the ribs of the enemy. A roar succeeded louder than a thousand train of artillery, and myriads of red-hot rocky fragments shot up to the heavens. No lava had yet begun to flow. Many persons here saw, or thought they saw, it floating down the flanks of the mountain to-day; but as I do not tax my imagination for my facts, on this head I can at present tell you nothing."

The late Sir Sydney Smith.—The *United Service Gazette* recently gave an account of a sister of Sir Sydney Smith having been found with her son in a state of great destitution in London. The latter had been bred to the sea, but had been for some time out of employment. Miss Jane Porter, the authoress, having addressed a letter to Mr. Emerson Tennent communicating the circumstances, that gentleman brought them under the notice of Sir Robert Peel, by whom the following letter was addressed to Miss Porter:—"Whitehall, Dec. 5, 1842. Madam,—I have just read a letter written by you, detailing facts connected with the past and present circumstances of Mrs. Dwyer, a very near connexion of the late Sir Sydney Smith. The means at my disposal, being confined to limited donations from a fund called the Royal Bounty, are very restricted; but such as they are, they shall be applied by me with the greatest satisfaction to her relief. I think it probable that they cannot be so in a manner more acceptable to her feelings than through your intervention; and if you will permit me, I will place the sum of 150*l.* in your hands, to be applied for the benefit of Mrs. Dwyer. I will write to Lord Haddington with respect to her son, and mention the general purport of your letter to Mr. Emerson Tennent. I have the honour to be, madam, your obedient servant,—Robert Peel." This prompt relief has been followed up by the appointment of the lady's son to a birth on board H.M.S. Thunderbolt, thus rescuing both individuals from their recent destitution.

Newspapers.—Every weekly newspaper published on Saturday next will have printed this year 53 Saturday numbers, the present year having commenced and finished on that day; a circumstance that will not occur again until 1853.

Law.

Court of Exchequer.—Banking Companies.—*Stewart (Public Officer)* v. *Walker. Same* v. *Griffiths and Others.*—Baron Parke pronounced the judgment of the Court in these cases, which were actions brought by the public officer of the East of England Banking Company, against the partners of another Banking Company, for debts due by the banking copartership. The defendants were sued in their private capacity as partners of the company, and they pleaded in effect, that the debt for which the action was brought was not incurred by them in their individual character, but as members of a banking copartnership having a public officer liable to be sued, under the provisions of the statute 7 Geo. IV., chap. 46. To this plea there was a demurrer, on several grounds; but the substantial objection to the plea was, that it did not answer the action, inasmuch as, although the defendants were members of a banking copartnership having a public officer, they were still liable to be sued in their private capacity as partners in a trading copartnership. The question which the court was called upon to decide was, whether the liability of the defendants as partners in trade was affected, and to what extent, by the statute on which the plea in question was founded? By the act 7. Geo. IV., c. 46, "for regulating of Copartnerships of Banks in England," it is declared that "all actions, or suits, and proceedings in law and equity, to be commenced by any person or persons, bodies politic or corporate, or others, whether members of such copartnership or otherwise, against such copartnership, shall and lawfully may be commenced, instituted, and prosecuted, against any one or more of the public officers nominated under this act, for the time being, of the said copartnership." It was perfectly clear that, under this provision of the statute, the plaintiff might have sued the public officer of the company, of which the defendants were members, and the question was, whether he was bound to sue such public officer, or had also the option of suing the individual partners? At common law, and before the statute, it was undoubtedly true that the plaintiff might sue the defendants as he now did, and it was strongly pressed upon the court in the argument that, if the Legislature intended to deprive persons to whom banking partnerships were indebted, of the right of suing the individual partners, the remedy would have been taken away by express enactment. It was to be considered, however, that by the common law the members of banking copartnerships were only liable to be sued upon debts and contracts arising whilst they were members, but by the Act of Parliament a new liability is created. Persons becoming members are liable to debts incurred before they become members, though they are only liable to be sued in the name of the public officer. Looking to the provisions of the statute, the object of the Legislature seemed to be, to provide a more convenient remedy for parties to whom banking copartnerships should be indebted, and, by the appointment of a public officer, to protect the individual members from actions for the debts of the company. It may be conceded that where no public officer existed, the common law right of action against the individual members remained, and perhaps there might be other special circumstances which would entitle a party to sue the private members. The construction the court put upon the Act of Parliament was, that in ordinary cases the Legislature meant that the public officer, and the public officer only, should be sued. The opinion of the court was, therefore, that the common law remedy against the individual partners was taken away by the statute, where a public officer existed, and that in such cases the public officer only could be sued. The learned baron then went through the other objections to the plea, which were purely of a technical nature, and were all overruled, and concluded by directing that the judgment of the court should be entered for the defendants.

Court of Queen's Bench.—*Veitch* v. *Russell.*—This was an action by the plaintiff, a physician, who sought to recover from defendant the amount of a bill for attendance on defendant's brother. He had to hire cabs to perform his journeys, and he had not been paid by fees as the attendance went on. It was contended for him that, in fact, his attendance in this instance had not been in the character of a physician, but had been performed under an express contract between him and the defendant. To prove this, certain letters were put in, the first of which was in these terms:—"As your account must be a formidable one, I must beg you will let me have it, up to the time of my brother's removal:" and another was in these terms:—"My wish is to present you with such a sum as you will be entitled to call on me to pay. I don't know what expense you may have incurred, or what you would consider remuneration for your great professional skill." At the trial of the cause, Mr. Justice Wightman left it to the jury to say whether there had been any contract between these parties; and if they considered that there had been such contract, they were to settle the amount of what they considered to be due. The jury negatived the existence of a contract, and returned a verdict for the defendant. A rule had since been obtained to set aside this verdict and have a new trial. The Court now expressed a clear opinion, that, as a rule, barristers and physicians could not maintain an action for fees. What they received was only an honorary payment for professional services. But there might, under particular circumstances, be a contract which should give them a legal right to payment. That contract, however, must be distinct and express. The letters here did not amount to such a contract. The case had been properly left to the jury, and the verdict was one which ought not to be disturbed. Rule discharged.

Applegarth v. *Colley.*—In this case, which came before the Court upon a demurrer to a special plea, setting up that the defendant was sued as the stakeholder of a sweepstakes deposited in his hands on a horse-race, Mr. Baron Rolfe delivered judgment in favour of the plaintiff, on the ground that the race in question did fall within the spirit of the Statute of Charles or Anne, to which reference had been made on the argument. The gaming and betting, he said, aimed at by the former statute, certainly was of a fraudulent or excessive character, and this proceeding did not fall within either description. The question then remained, was this transaction affected by the Statute of Anne? The first section of that statute referred to betting and playing, &c., on credit more than 100*l.*, and avoided all securities given upon such transaction. It was urged at the bar by the plaintiff, that though the securities were void, yet that the statute meant to protect the transaction itself, or, in other words, to allow of a man's recovering on the implied contract, but not on the express one, and that on the ground that the Court might always have the means of seeing the contract itself, which it might not do when it was secured by bill, note, or other instrument. The cases upon this clause are contradictory, and by no means satisfactory; but upon the whole, we incline to the opinion advanced by the defendant, and think that the Legislature meant to apply that clause to all sorts of bets and gaming on credit, whether secured in any way or not. It comes, then, to this point—is this contract here, on which the plaintiff sues one for money lost at play, within these statutes? And this we answer in the negative; because it is clear that they meant to check playing at such games on ticket or credit. Now this is strictly a ready-money playing. The subscribers deposit 2*l.* each, and a party advances 15*l.* as a premium to be given to the winning horse, and the owner of that horse wins, and ought to receive, all the stakes as soon as the race is over. For this reason we think that this case does not fall within the first section. Neither does it come within the second, which prohibits the recovery of any money lost at one sitting beyond 10*l.*, for no one person loses that sum here. That section must apply to the case of two parties playing or betting to the extent of 10*l.* at one time, which is a very different case from that of a sweepstakes. At all events, whatever the plaintiff's right might be to recover the stakes, it is clear that there is nothing to prevent him from suing for the prize of 15*l.*; to that extent he is decidedly entitled to our judgment. Under these circumstances, the Court pronounces its judgment generally for the plaintiff.

Vice-Chancellors' Courts.—(Before Sir L. Shadwell.)—*Hickson* v. *Mainwaring.*—This suit was instituted on behalf of the creditors of Sir Henry Mainwaring, to impeach an arrangement entered into by him with his son, Mr. Harry Mainwaring, in 1838, by which he conveyed to the latter his life interest in the family estates in Cheshire, with a view to secure an annuity of 500*l.* a-year to himself, and to devote the rest of his property for the benefit of his creditors. The creditors alleged the transaction to be a fraud upon them, and prayed that the deeds might be delivered up. Upon a motion for the appointment of a receiver over the property, the following circumstances were stated to the Court:—Sir Henry Mainwaring, who was tenant for life of the family estates, prevailed upon his son, the next tenant in tail, upon attaining his majority, to join him in a new settlement of the estates, by which a power of appointment was given to Sir Henry, and in default in strict settlement upon Sir Henry, his son, and issue, not excluding the female branches. On the son's marriage, several years afterwards, another settlement was executed of these and some other estates belonging to Sir Henry, by which they were made subject to powers of sale for the payment of some very heavy encumbrances which had been created by Sir Henry subsequently to the previous settlement, but which could only be exercised by the consent of his son. The creditors of Sir Henry, having discovered the position in which they were placed by this deed, became clamorous, and Sir Henry was forced to fly to Boulogne. In the course of 1838, an application was made by Mr. Harry Mainwaring to his father to assign certain leasehold tithes, in order that some bond debts on which they were jointly liable might be paid off, stating that his object was not to enrich himself, and intimating that in doing so it could never be said Sir Henry intended to defraud his creditors. Sir Henry Mainwaring, who was alleged to have committed several acts by which his son's interest in the estates was greatly prejudiced, was induced to accede to the proposal, and replied that he would do anything to relieve his son, if he were not required to commit an injustice to his general creditors. Sir Henry was alleged to have given this reply in consequence of having been advised by his solicitor, Mr. Corbett, that the assignment would be an undue preference to a creditor. The assent of Sir Henry was at length obtained to the plan, on being informed that it had Mr. Brodie's approbation, and he finally executed the assignment of the tithes, and a conveyance of his life-interest, Mr. Henry Mainwaring stating by letter that he should consider himself as acting between his father and the creditors, and that all that could be done would be devoted to them. The arrangement being thus concluded, Sir Henry thought he was free to return to this country; but on expressing such an intention to Mr. White, he was advised not then to attempt it, as the creditors were not yet reconciled to the loss they must sustain, but rather to adopt the suggestion of Mr. Brodie to change his residence to Germany. Sir Henry upon this declared his disappointment at the effect of the arrangement, and asked if the income promised him could not be secured by a deed; but being told it was impossible under the increasing importunities of his creditors, he, in 1841, executed a deed which secured him his personal liberty, and assigned to them his life interest, which had been previously vested in his son in the manner before mentioned. Under this last deed of 1841 the title of the creditors to sue in equity was set up, and they submitted by their bill that the transaction of 1838, by which the life interest of Sir Henry was assigned, was a fraud both as against himself and the creditors. The conduct of Mr. Harry Mainwaring was defended by impugning the previous deception, misrepresentation, and injury, practised upon him by Sir Henry himself, whereby, upon attaining his majority, he was persuaded, under false representations that he was only consenting to admit the introduction of females into the entail, to give up all his interest in the estates to his father, and place himself at his mercy; that soon after he had yielded to this request, the estates were encumbered by Sir Henry to the extent of 40,000*l.*, an annuity suffered to fall in arrear, and the estate impoverished by the cutting down of timber. The deeds were defended on the ground that they had first been submitted to the most honourable and eminent practitioners, who were acquainted with all the affairs of the family, and that they were honourably intended to save something even for the creditors, where everything would have otherwise been spent in wild and useless litigation. The present motion, however, was resisted mainly on the ground that the answer had not admitted such a title in the plaintiffs as entitled them to have a receiver appointed over the property. The Vice-Chancellor very briefly delivered judgment, confining his observations to the defect of interest shown on behalf of the plaintiffs to entitle them to what was asked by the notice of motion. His Honour was willing to admit that very grave questions arose on the face of the correspondence between Sir H. Mainwaring and his son, whether the deed of March, 1838, could be supported in a court of equity. But even supposing it should turn out that there had been, to a certain extent, an improper dealing with the estates, on the part of the son, in obtaining the conveyance of his father's life interest, yet before relief in equity could be given to the father, sufficient equity ought to be done to the son. At present, however, the court gave no opinion upon any of these points; the only question now to decide was, whether the plaintiffs had shown any right to have a receiver of the property. Upon a careful examination of the deed of 1841, his Honour could find no specific conveyance of any interest to the plaintiffs in the estates. All the deed intended to do was to admit that the plaintiffs were judgment creditors, but it abstained from making any conveyance to them of an interest in the property. Supposing, however, the plaintiffs had such an interest, it was not made to appear to the court by the manner the case was brought before it. If a case of suspicious title were shown upon the admissions in the answer, the court would appoint a receiver; but the plaintiff had failed to do so, and it was not in their power to supply the defect by affidavit. The case of the plaintiffs, therefore, entirely failed, and if they came to the court with a speculative motion of this nature, they ought to take care to be prepared with the necessary materials to establish that they had such an interest as they claimed in the estates; but failing to do so, the motion must be dismissed with costs.

TATTERSALL'S, Thursday.—The following bets will sufficiently explain the nature and extent of the business transacted, without the necessity of any comment:—

DERBY.

25 to 30 agst. Mr. Blakelock's A. British Yeoman (taken).
2500—100 agst. Colonel Peel's Murat (taken.)
1000—20 agst. Duke of Grafton's Oxygen colt (taken.)
5000—100 agst. Colonel Peel's St. Valentine (taken.)
500—10 Lord Chesterfield's Parthian (taken and afterwards offered.)
1000 to 16 agst. Mr. Coleman's Jamal (taken and afterw. offered)
1000—15 agst. Duke of Richmond's Clara colt (taken and afterwards offered.)
2000—30 agst. Lord Exeter's Lucetta colt (taken.)
2000—15 agst. Mr. St. Paul's Cheviot (taken.)

OAKS.

1000—30 agst. Lord Westminster's Decoy filly (taken.)

MARK LANE, Friday, Dec. 23.—We have but little English Wheat at Market, and Monday's quotations are fully maintained; on Wednesday there was a good demand for Foreign at about the same rates, and this morning there has been a trifling advance realised on some fine qualities: we did not hear of any sales for exportation. Fine Malting Barley is scarce and our currency is maintained, but secondary and grinding qualities are plentiful and 1s. cheaper. Peas are sent freely to market and are a dull sale; Beans have realised the same prices. There is a large supply of Scotch Oats at Market, which are of good quality and yet a dull sale. Irish are unaltered.

SEEDLING DAHLIAS FOR 1843.

MRS. JAMES RICHARDSON and TODD'S LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20, 1842.—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards of York. This Flower was shown at the Royal South London Floricultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first-rate. The following was the decision of the censors: Form, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasionally tipped; class of quality, first-rate.—*From the Gardeners' Chronicle and Gazette.*

Also obtained the following prizes :—No. of Blooms Exhibited.

1st prize at Hull, Aug. 30th	12
1st prize at Beverly, Sept. 7th	2
Awarded at extra prize at the Royal South London Horticultural Society, Sept. 13th	4
1st prize at Leeds, Sept. 21st	12
1st prize at Newcastle, Sept. 21st	6
1st prize at Sunderland, as a superior fitst-class Seedling, Sept. 27th	6
1st prize at the York Floral and Horticultural Society, Sept. 28th	18
1st prize at the York Florticultural Society, Oct. 1st .	12
1st prize in its class as the best white or blush, ditto.	

Height, 4 to 5 ft. Plants, 10*s*. 6*d*.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size; very constant, and a decided first-rate show flower. Height, 4 ft.; Plants, 10*s*. 6*d*.

All orders addressed J. EDWARDS, Florist, Layerthorpe, Nursery or Seedsman, 7, New Bridge-street, York, will be strictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec., 1842.

FUCHSIA ST. CLARE.

YOUELL & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Advertisement of the above magnificent Fuchsia, inserted in this Paper of the 24th inst., together with their two new Verbenas.

Great Yarmouth Nursery, Dec. 29, 1842.

SHIRLEY VINEYARD, NEAR SOUTHAMPTON,—NURSERY DEPARTMENT.

CLEMENT HOARE respectfully announces that he has now on sale an extensive collection of Grape Vine Plants of superior growth, and of the most approved sorts in general cultivation, varying in price from 2*s*. 6*d*. to 7*s*. 6*d*. each.

Lately Published,

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS. By CLEMENT HOARE. 3d edition. 8vo, 7*s*. 6*d*. boards. LONGMAN & Co., London. Sold by all Booksellers, and at the Vineyard at Shirley.

PATRONIZED BY HIS GRACE THE DUKE OF RUTLAND AND MANY OF THE NOBILITY,

THE FASTOLFF RASPBERRY.—For many years past there has been cultivated in the neighbourhood of Yarmouth, adjacent to the ancient Castle of Sir John Fastolff, a red Raspberry of a most extraordinary size and rich flavour. The Nobility who visit the sea-coast here have invariably expressed their astonishment at the exceeding fineness of the fruit of this variety, and until lately YOUELL and Co. have not been enabled to obtain a sufficient stock of it to bring it into public notice; but having now obtained a supply (although limited) of fine Canes, beg to offer them on the following terms, and they can be sent with safety to any part of the United Kingdom, on the receipt of a Post-office order.

Packages containing 50 Canes, 25*s*.—Packages containing 25 Canes, 14*s*.—Package included.

The few to whom YOUELL and Co. have sent it, have expressed their high admiration of its superiority over other varieties; and a letter just received from a Gentleman in Derbyshire, to whom this variety was sent, states that it invariably takes prizes at the Hort. Shows in his neighbourhood. In conclusion, YOUELL and Co. beg to state that they have not, or do they intend to recommend any article but that which they can do with confidence; and in this instance they feel fully assured of its giving the most entire satisfaction.—Great Yarmouth Nursery, Norfolk, Dec. 22d, 1842.

SEYMOUR'S SUPERB WHITE CELERY.

MESSRS. LANE and SON beg again to offer to the Public the above superior Celery Seed (at 1*s*. 6*d*. per packet); the qualities of which are so well known as to require no eulogium here, although it may be advisable to state, by way of caution, that there is an old variety of Seymour's White Celery offering for sale, which is very inferior to the above.—Also the BLACK-SEEDED BATH COS LETTUCE, at from 1*s*. to 5*s*. per packet.—Either or both can be sent by post, on the receipt of postage stamps or post-office order from unknown correspondents.—Nurseries, Great Berkhampsted, Dec. 26, 1842.

CHARLES FARNES, No. 128, ST. JOHN-STREET, LONDON, respectfully informs the Public that his Collection of New KITCHEN-GARDEN AND FLOWER-SEEDS are now ready to send out. Catalogues with prices will be forwarded on application.

Farnes' Superior First Early Peas, height, 1½ to 2 ft.
Flack's Dwarf Blue Victory Pea, 2 ft.
Knight's Dwarf Blue Marrow do., 3 ft.
American Dwarf do., do., 3 to 4 ft.
Improved Green ditto, do., 4 ft.
New-Auvergne, do., 4 to 5 ft.
Young's Milford Marrow, do., 5 to 6 ft.
Improved Giant do., do., 6 to 7 ft.
Marshall's Early Prolific Bean
Green Dwarf Fan do.
Green Windsor do.
New-England Long-podded do.
Early French Olive-shaped Radish
Wood's Early Frame do.
White Spanish Onion
White Globe do.
James Keeping do.
Early Dutch Horn Carrot
Long Red Surrey do.
Large Altrincham do.
Ady's Large Cos Lettuce
Paris White do., do.
,, Green do., do.
Black Seed Bath do., do.
Siberian do., do.
Golding's do., do.
Versailles Cabbage do.
Malta do., do.
Spotted do.
Flanders Spinach
Seymour's White Celery
,, Red do., and other kinds
Earliest Dwarf Cabbage
,, Nonpareil do.
Large Asparagus do.
Early Hope do.
,, Crompton do.
Earliest White Walcheren Broccoli
Chappell's Splendid Cream do.
,, Early White do.
Myatt's do., do., do.
Imported Brussels Sprouts
Small Dark-Red Beet
,, French Sugar do.
,, do. Sweet do.
,, do. Summer Endive
,, do. Chicory, for coffee

With every variety of Vegetable and Flower Seeds in cultivation.

T. AND C. LOCKHART, FLORISTS, 156, Cheapside, London, have published their List of Seeds for 1843, which will be forwarded free, by post, on application. In consequence of the late favourable season, they are able to offer most kinds at considerably reduced prices.

THE FARMERS' AND GENERAL FIRE AND LIFE INSURANCE INSTITUTION. Empowered by Act of Parliament. Offices, Strand, London. Capital, 500,000*l*. With 1,960 Shareholders Enrolled.

HONORARY DIRECTORS.

His Grace the Duke of RUTLAND
The Earl of STRADBROKE
The Earl of COVENTRY
Earl DUCIE
The Earl of STAIR
The Earl of STAMFORD and WARRINGTON
Lord STANLEY, M.P.
Lord RAYLEIGH
Lord FAVERSHAM
Lord Viscount CAMPDEN

And Seventy-two other Members of Parliament and Gentlemen.

COUNTY DIRECTORS.—Upwards of 170 Gentlemen, Landed Proprietors, or otherwise connected with Agriculture, holders of 50 Shares, have been appointed County Directors.—FARMING STOCK insured without the Average Clause at 1*s*. 9*d*. per cent., no duty.—COMMON INSURANCE at the usual moderate rates.—INSURANCE OF LIVES on an equitable scale of charge. Endowments of all kinds for future or existing children. The usual commission to Solicitors. Agents are appointed in all the principal Towns in the kingdom. W. SHAW, Managing Director.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

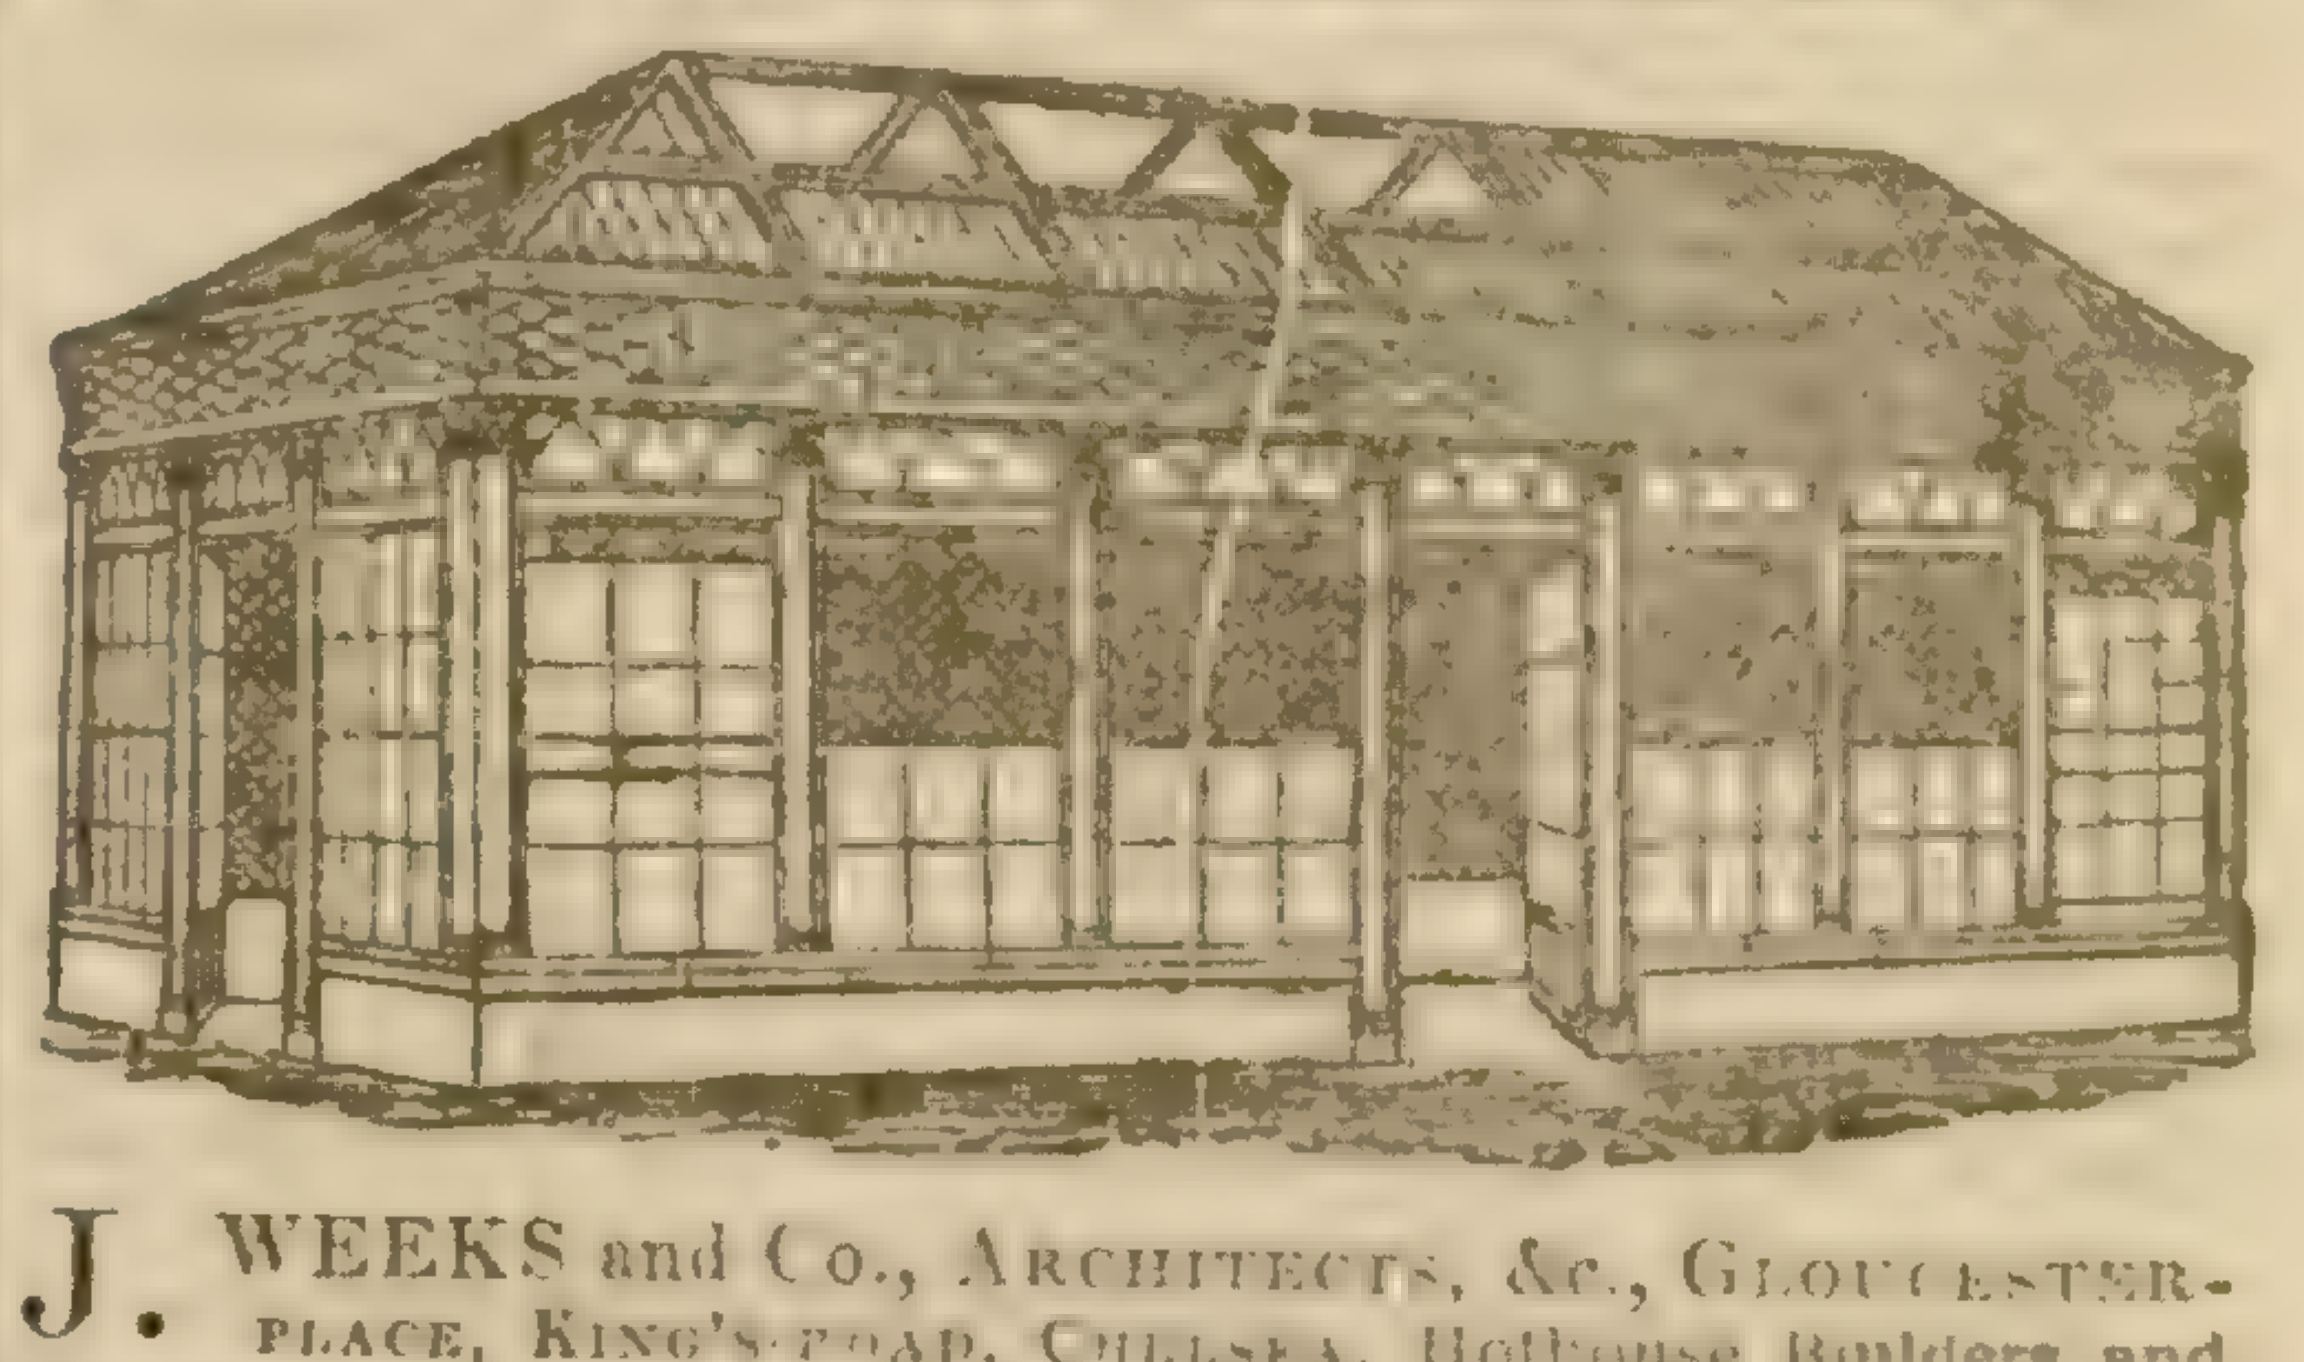
PENN'S SYSTEM PERFECTED—FOR OBTAINING A FREE CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL & OTHER BUILDINGS.

W. HILL having had every opportunity of making himself acquainted with the best method of constructing Horticultural Buildings of every kind—to command the above truly-desirable result—and having with much satisfaction witnessed the gradual improvement in the adaptation of this principle to almost every variety of Building, begs to announce to the Nobility and Public generally, that he erects CONSERVATORIES, HOTHOUSES, PITS, &c., &c., upon the above system, which has (*at an immense cost to the inventor*), been brought to *great perfection*, and heats the same by HOTWATER APPARATUS, with improved Tube or Conical Boilers. W. HILL also adapts DR. ARNOTT'S NEW BALANCED REGULATOR to the Boiler Apparatus, by which an immense saving of fuel is effected, the greatest regularity of Temperature preserved, and much time and trouble saved. PENN'S SYSTEM only requires publicity to be appreciated. The Public are therefore invited to inspect its efficient working at the Inventor's Residence, Lewisham. The great end gained by adopting this system, *is a perfect and rapid Circulation*, producing consequently an equable temperature throughout the building (of whatever construction), and renders access to it at all times safe and agreeable, ladies of the most delicate constitution being enabled to remain for hours in a temperature greatly exceeding summer heat, with as much comfort as could possibly be derived from an out-door temperature equally high. W. HILL would refer any, who may desire to apply the above system to Forcing-Houses in particular, to Mr. JOHN WILLMOT, of Isleworth, who after 40 years' experience has adopted this system throughout his extensive Establishment. Designs, and any further information, upon application to W. HILL, Builder and Surveyor, Lewisham.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5*l*. 5*s*. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WAYTE's New Patent Land-presses and Drills.

HORTICULTURAL BUILDING and HEATING by HOT WAT



J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER-PLACE, KING'S-ROAD, CHELSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

GUANO ON SALE BY THE IMPORTERS, ANTHONY GIBBS AND SONS, LONDON; GIBBS, BRIGHT, AND Co., LIVERPOOL AND BRISTOL.

THE GENUINE GUANO ON SALE AT LIVERPOOL.—Any quantity of this celebrated and valuable NATURAL MANURE can be obtained from the Queen's Bonded Stores, either in Liverpool or in London. Apply to Messrs. WILLIAM JOSEPH MYERS and Co., Importers, Liverpool; Messrs. COTESWORTH, POWELL, and PRYOR, Great St. Helen's, London; or EDWARDS, DANSON, and Co, Brokers, Liverpool.

This day is published, price 3*d*.,

PUNCH'S ALMANACK FOR 1843, Brimful of Fun and Jokes, and containing upwards of One Hundred humorous Cuts. Also,

PUNCH'S LETTERS TO HIS SON. Revised and corrected from the original MSS. in the Bloomsbury Library, by DOUGLAS JERROLD. With 24 Illustrations by KENNEY MEADOWS. Price 5*s*.

PUNCH'S PANTOMIME; or, HARLEQUIN KING JOHN, AND MAGNA CHARTA; as now performing at the Theatre Royal, Covent Garden. Price 1*s*.

PUNCH; or, the LONDON CHARIVARI. Volume the THIRD. Price 8*s*. Published every Saturday, price 3*d*., and in Monthly Parts.

PUNCH'S POCKET-BOOK is now on sale, price 3*s*. 6*d*., roan tuck.

OFFICE, 13, Wellington-street; and sold by all Booksellers.

To begin precisely on the 1st of January.

No. 1.,

THE GARDENERS' EDITION of the BOTANIC GARDEN, at Sixpence a Month. ("The money's nothing.") The work will contain coloured Copper-plate Engravings. It will contain Sixteen Wood Engravings. It will contain plain descriptions of the best FLOWERING PLANTS, the best method of management, and everything else that's useful. What more can be desired?

If you don't order the GARDENERS' EDITION at SIXPENCE, you disregard cheap moral gratification.

ENCYCLOPÆDIA OF FLOWERS.

On Saturday, January 7, will appear the first portion of this valuable guide to the Florist and Amateur—being

THE COMPLETE HISTORY and CULTURE of the HEARTSEASE, for the Border and for Exhibition; forming a leading feature in the First Number for 1843 of the GARDENER and PRACTICAL FLORIST, price THREEPENCE. Published every Saturday by R. GROOMBRIDGE, 5, Paternoster-row, where all advertisements that can interest the nobility and gentry who have gardens, must be forwarded. The charge is 5*s*. for six lines, and 6*d*. every additional line.

THE NUMBER FOR JANUARY NEXT WILL COMMENCE THE VOLUME OF

MAUND'S BOTANIC GARDEN, which, besides the former additions, will contain a portion of Professor Henslow's BOTANICAL DICTIONARY; and this will be continued in every succeeding Number till completed. The Dictionary will contain an explanation of upwards of [illegible] words, and nearly 200 illustrative woodcuts. The plates of Hardy Garden Flowers continue to be engraved and coloured in their usual beautiful style; and the FLORAL REGISTER, with [illegible] woodcuts of plants, and the AUCTARIUM, are given as usual.

Price 1s. 6d. Large, 1s. Small, per Month.

The January Number will afford a favourable opportunity for those who are fond of the open Garden to commence taking this now cheapest of all Botanical works.

London: SIMPKIN, MARSHALL, & Co.

On the 1st of January, 1843, price 1*s*., No. I. of

THE ZOOLOGIST; an entirely new Monthly Illustrated Magazine of Natural History, treating of Quadrupeds, Birds, Reptiles, Fishes, Insects, and Animalcules, together with all facts and anecdotes relating to their appearance, migrations, habits, food, habitations, nests, and young.

JOHN VAN VOORST, 1, Paternoster-row.

TRACTS ON BEES, BY THE REV. W. C. COTTON.

Now ready, price 6*d*. each, or 5*s*. per dozen,

TWO SHORT AND SIMPLE LETTERS TO COTTAGERS ON BEES. Letter I. On BEE-MANAGEMENT, Letter II. On the NATURAL THEOLOGY of BEES. By the Rev. W. C. COTTON, M.A., Student of Christ Church, Oxford; and Chaplain to the Lord Bishop of New Zealand.

RIVINGTONS, St. Paul's Church-yard, and Waterloo-place.

Also, by the same Author, just published,

MY BEE-BOOK. (*With 70 Engravings on Wood.*) Small 8vo. 12*s*.

In One Volume, 8vo, with numerous Wood Engravings, 20*s*.

THE SUBURBAN GARDENER AND VILLA COMPANION; Comprising the Choice of a Suburban or Villa Residence, or of a Situation on which to form one; the Arrangement and Furnishing of the House; and the Laying-out, Planting, and general Management of the Gardens and Grounds; the whole adapted for Grounds from One Perch to Fifty Acres and upwards in extent; and intended for the Instruction of those who know little of Gardening and Rural Affairs.

"The most complete work on villa-gardening that has ever appeared in our language."—*Quarterly Journal of Agriculture.*

"Not only those who are looking out for a house, but such as are settled in one already, be it small or large, will find much and available information. All who delight in a garden should possess this book."—*Spectator.*

"The whole work contains so much sound good sense, combined with the results of long experience, that it will be invaluable to every one who wishes to enjoy all the comforts of which a suburban residence is susceptible, with a due regard to economy; and it should be carefully perused by every person who resides in a house having a garden. We regard it, on the whole, as the most original, and as calculated to be the most extensively useful, of all Mr. Loudon's works, and we have no doubt it will effect as great a change in the appearance of the gardens and grounds of our suburban and other small villas, as Mr. Loudon's 'Encyclopædia of Cottage Architecture' has, in various parts of the country, effected in the appearance of the labourers' cottages."—*Times.*

London: LONGMAN, BROWN, GREEN, AND LONGMANS.

Now published, price 10*s*.,

A SECOND Edition of MILLS' TREATISE ON THE CULTURE OF CUCUMBERS, MELONS, SEA-KALE, and ASPARAGUS, with a descriptive Plate of his Pit, and also daily Notes of Practice from December to February inclusive.

Published by WM. SMITH, 113, Fleet-street, and sold by all Booksellers.

REV. LEONARD JENYNS, M.A. F.L.S., &c.

In a few days will be published,

THE NATURAL HISTORY OF SELBORNE.

By the Rev. GILBERT WHITE.

A new edition, in foolscap 8vo, price 7*s*. 6*d*., with 26 Illustrations, and Notes by the Rev. Leonard Jenyns, M.A. F.L.S., &c., Author of "A Manual of British Vertebrate Animals."

JOHN VAN VOORST, 1, Paternoster-row.

ENCYCLOPÆDIA OF FLOWERS.—Any Person wishing to obtain THE FIRST NUMBER FOR 1843, of THE GARDENER AND PRACTICAL FLORIST, which contains the commencement of the Encyclopædia of Flowers, may have it *forwarded free*, by inclosing 4 Postage-stamps to the Publisher, RICHARD GROOMBRIDGE, 5, Paternoster-row.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.

Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY.

The Number for December, 1842, contains highly-finished drawings of *Cattleya superba* (Superb-flowered Cattleya), *Correa bicolor* (Two-flowered Correa), *Loasa Herbertii* (Mr. Herbert's Loasa,, *Salvia bicolor* (Two-coloured Sage). Floricultural Notices—Gloxinia discolor. — Gongora—?—Maurandya—?—Niphæa oblonga. — Oncidium Lemonianum. — Oncidium michrochilum.—Oncidium volubile.—Scutellaria splendens.—Tropæolum azureum. Operations for January—Index—Dedication—Advertisement—Latin Index to Coloured Figures of Plants—English Index to Coloured Figures of Plants—Woodcut and Coloured Illustrations.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. ORR and Co., Paternoster-row.

Price 7*s*., illustrated with Wood-cuts of Birds, Cages, &c.,

A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BECHSTEIN, M.D.

"A very delightful book of its kind. . . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator.*

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact, rivals the beauty of the Annuals."—*Weekly Dispatch.*

London: W. S. ORR and Co.; and W. R. CHAMBERS, Edinburgh.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5*s*. 6*d*.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published." London: WHITTAKER and Co.

FAMILIAR ASTRONOMY. By GEORGE DARLEY, A.B., Author of a System of Popular Geometry,—Companion to the Popular Geometry,—a System of Popular Algebra,—and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth, lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A. SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4*s*. 6*d*. cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4*s*. 6*d*. cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4*s*. 6*d*. cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3*s*. 6*d*. cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics."*

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

In one small volume, price 15*s*.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. ANDREWS, Bond-street; ORR & Co., Paternoster-row.

HAND-BOOKS FOR THE PEOPLE.

THE HAND-BOOK OF GARDENING; expressly intended for Persons possessing and fond of cultivating a Garden of moderate size. Price 2*s*. cloth, a New and Enlarged Edition.

THE HAND-BOOK OF BOTANY;

Or Linnæan Lessons on Common Plants, for Field and Garden Practice. Price 2*s*.

THE HAND-BOOK OF AGRICULTURE;

Chiefly for the use of those interested in the Allotment System. Price 1*s*. 3*d*.

THE HAND-BOOK OF COOKERY;

Intended for the use of the Middle Classes. Price 2*s*. cloth.

THE HAND-BOOK OF THE TOILETTE;

Having in view the union of Bodily Health with Beauty of Person. Price 2*s*. cloth.

THE HAND-BOOK OF THE LAUNDRY;

Expressly intended for those who "wash at home." Price 1*s*. 9*d*.

THE HAND-BOOK OF MEDICINE;

Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2*s*. cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY.

Price 1*s*. 9*d*.

London: W. S. ORR & Co.; and W. and R. CHAMBERS, Edinburgh.

One Volume, price 7*s*. 6*d*.,

THE LIFE AND TIMES OF RIENZI.

"Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository.*

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to become acquainted with the true history of a man who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

London: WHITTAKER and Co.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener (Sundays excepted).

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.—City Office, 98, Gracechurch-st.

KEENE'S PATENT CEMENT.

THIS CEMENT is harder than any other known, and is especially fitted for the Walls of Hothouses, Conservatories, &c., as it neither cracks nor vegetates, and is perfectly impenetrable by insects.

The entire range of Hothouses erecting by the Government at Frogmore are about being stuccoed with it, and the price ranges nearly equally with the Cements in ordinary use for floors, and it forms a paving harder and cheaper than Portland Stone.

Patentees and Manufacturers, J. B. WHITE and SONS, Millbank, Westminster.

WANTS a SITUATION, as STEWARD and AGENT, a person quite competent to the general management of landed property, having had many years' experience in the above capacity.—Direct, prepaid, to A. B., 10, Tottenham Court-road, London.

WANTS a SITUATION as GARDENER, a Married Man, 37 years of age, who thoroughly understands Forcing, the cultivation of Exotics, Kitchen and Flower-garden, and everything connected with the business; he has lived five years in a Situation where the strictest attention was paid to good cultivation and management. Address M. M., at Mr. STANLEY'S, Butcher, Edmonton.

WANTS a SITUATION as GARDENER, a Married Man, without incumbrance; age 40, of industrious habits, perfectly understands his business, and is a good Florist; his wife is a good Cook, can bake, and understands the Dairy; both can be well recommended from their last place. To save trouble, Horse, Chaise and Cows will be objected to. Address to M. E., at Mr. CHARLWOOD'S, Seedsman, 14, Tavistock-row, Covent-Garden.

WANTED BY HUGH LOW AND CO., a person as PROPAGATOR. Application to be made by letter only.

Clapton Nursery, London, Dec. 21, 1842.

TO GARDENERS.—A Premium of TEN POUNDS will be given to obtain the Advertiser a Situation as under-Gardener, where there is a good collection of Plants, and all kinds of Forcing. It will be expected, that the Engager will keep the Advertiser a limited time: such as may be agreed on. He has been in the business 5 years, age 22. For further particulars address to J. A., Mr. LAWRENCE, Bookseller, Welwyn, Herts.

SEED-TRADE.—WANTED IMMEDIATELY (for a London House), an ACTIVE SHOPMAN, accustomed to the Trade. Address A. B. C., Mr. LANGDON'S, Stationer, Newgate-st.

NOTICE.—WILLIAM PAMPLIN respectfully informs his Customers and Friends that, he has removed from 9, QUEEN-STREET, to 45, FRITH-STREET, SOHO-SQUARE. London, January, 1843.

SCOTTISH AGRICULTURE.—The Subscribers to the Fund for obtaining the services of one or more CHEMISTS to aid Agriculturists in Scotland, by means of analysis, in selecting the specific Manures best fitted for their estates or farms, and in checking the adulteration of the substances now extensively used for fertilising Land and for feeding Stock, are requested to meet in the Highland Society's New Museum, on George IV. Bridge, on Monday, 9th January, 1843, at 3 o'clock, P.M., for the purpose of having laid before them a Report by the Interim Committee appointed at a meeting of noblemen and gentlemen, held in Douglas's Hotel on the 14th instant; and of passing such resolutions as may be necessary to carry into effect the proposed object.—Edinburgh, 23d Dec. 1842.

PATRONISED by all the principal Architects and Builders in this Country and Abroad.——SEYSSEL ASPHALTE.—In consequence of the daily attempts made to imitate this valuable mineral production, and of the name of "Asphalte" being given to most of the spurious and "cheap" materials, the Directors of this Company particularly recommend Architects, Builders, and others, (for the purpose of securing the use of the genuine article,) to insert in their specifications "The Seyssel Asphalte, Claridge's Patent," and not merely "Asphalte" or "Bitumen," as, in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. For the information of those residing at a distance from London, and of those who, having employed the spurious composition, may, from its failure, have become prejudiced against the use of Asphalte, the following are mentioned as some of the distinguishing qualities of the genuine material. The Asphalte of Seyssel is of a light colour, closely resembling Yorkshire stone, has a smooth surface (without being slippery), and joints almost imperceptible; it is also free from smell, is not acted upon by change of temperature, and is at all times dry and warm, and remarkably pleasant to walk upon, and, from its elasticity, never cracks. The fictitious material, on the contrary, has a dark and dirty-looking appearance, presents a rough and coarse surface, and, from its brittleness, is liable to crack, particularly in frosty weather. In consequence of the above qualities, the genuine material (being perfectly impervious to wet) has been used with great advantage for roofing; it can be laid down to any extent, presenting one uniform surface, and is far superior to lead, as it is not liable to expansion or contraction in consequence of any change in the temperature. For covering of arches, (to prevent the percolation of wet,) it is invaluable, the Greenwich Railway Company alone having covered upwards of 400,000 superficial feet; it has also been used on the Great Western, Birmingham, Midland Counties, South Western, Brighton, Blackwall, and other Railways; at the joint Stations, London-bridge, and at the South Metropolitan, Highgate, and Nunhead Cemeteries. As proof of the great durability of the genuine Asphalte, it need only be mentioned that the first work executed in this Country with this material, (amounting to 3,952 feet,) was at Whitehall, opposite the Horse Guards, in the month of April, 1838, and which, although only half an inch in thickness, has remained up to this time (a period of four years and eight months) in the most perfect condition. Books of Testimonials with scale of prices may be obtained on application to J. FARRELL, Secretary.

Seyssel Asphalte Company's Depot, Stangate, London.

Note—Neither the pavement in Parliament Street, London, nor the works at the Model Prison, at the Abney-park Cemetery (which from its failure has since been removed), or at the Hotel at the Slough station of the Great Western Railway, were executed by this Company.

TARPAULINGS, POLICE-CAPES. — 8,000 Yards of Tarpaulings on Sale, at 2*s*. per square yard; made up to any sizes, same price. It is perfectly waterproof, and is suitable for Roofs, Stack and Waggon Covers, Greenhouses, Frames, &c. &c. Above 1,000 second-hand London Policemen's Tarpauling Capes, lined with cloth, redressed and waterproof, 1*s*. 9*d*., 2*s*., and 2*s*. 6*d*. each, suitable for Gardeners, Shepherds, Carters, Labourers, and Farm-servants. Garden-Nets, Rabbit-Nets, Sheep-Nets, and Fishing-Nets of all kinds.—ROBERT RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New-road, near Euston-square, London. Samples sent.

N.B.—Largest size Garden Mats, 1*s*. 2*d*. each, and 1*s*. 1*d*. each if 50 taken at once. Mats 6 ft. by 3¼ ft., 7*d*. each.

ROWLAND'S MACASSAR OIL.—Under the Special Patronage of Her Most Gracious Majesty the QUEEN, the Royal Family, and the several Courts of Europe. This Oil is universally acknowledged to be the ONLY ARTICLE that will effectually *produce* and *restore Hair*, prevent it from *falling off* or *turning grey*, free it from *scurf* and *dandriff*, and will render it *delightfully soft and flexible*. It will also preserve the coiffure in the heated atmosphere of crowded assemblies. CAUTION.—Much *pernicious* trash is now offered for sale as "MACASSAR OIL;" it is therefore of great importance to purchasers to see that the words "ROWLAND'S MACASSAR OIL" are engraven on the wrapper. All others are "GROSS IMPOSITIONS." The Proprietor's Signature is also engraven on the wrapper, thus:—*A. ROWLAND & SON, 20, HATTON GARDEN, LONDON*; Countersigned "ALEX. ROWLAND." Price 3*s*. 6*d*.—7*s*. Family Bottles (equal to four small), 10*s*. 6*d*., and double that size 21*s*. per bottle. Ask for "Rowland's Macassar Oil." Sold by them, and by Chemists and Perfumers.

Handsomely bound in cloth, with Ninety-three Wood-Engravings, Price 6s. 6*d*.
ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.
From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."
TILT and BOGUE, Fleet-street.

The Gardeners' Chronicle.

SATURDAY, DECEMBER 31, 1842.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Monday, Jan. 2	Entomological	8 P. M.
Tuesday, Jan. 3	Floricultural	6½ P. M.
Wednesday, Jan. 4	Geological	8½ P. M.
Friday, Jan. 6	Botanical	8 P. M.
Tuesday, Jan. 10	Zoological	8½ P. M.
Wednesday, Jan. 11	Medico-Botanical.	8 P. M.
Saturday, Jan. 14	Royal Botanic	8¾ P. M.

OUR friends across the Tweed may well be more successful than their neighbours in undertakings where honour or profit are to be won. It is no marvel that they distinguish themselves at the bar, in the colonies, in the army, or in the more humble, but far more important, pursuits of Agriculture. We are not surprised that a Scotch farmer should grow rich at a rent of 5*l*. an acre, where an Englishman would be ruined at 40*s*.: we perfectly understand the reason of a Scotch gardener managing a charge successfully from which a Southron would turn away in despair. The Scotch are better educated: there is the whole secret. They have not more enterprise than other people; they are not soberer; they are probably not more persevering: but the nature of their education gives them skill, imparts a force and true direction to their acts, and enables them to concentrate such energy as they possess in the manner most likely to tell upon the object before them.

Of this national characteristic we have, at this moment, a striking example. It is certain that, among the aids which cultivators must now look to with most anxiety, is that of Chemistry. It is evident to all who understand the principles of tillage, whether in gardens or fields, that the dear old empirical rules of action are inadequate to the wants of the world; that, if we are not to starve, or be otherwise ruined, we must have more out of the land than our fathers had; and that the common modes of cultivation will not give us more. This is as plain as the sun at noonday. Under such circumstances, what is it that we English do? Why, our Agricultural Associations talk of chemistry as a fine thing—listen to lectures on chemistry, often, we fear, without understanding them—and are contented to rest there; or, at the most, they expend a few pounds in procuring bad analyses of soil from country chemists, or careless London analysts. The Horticultural Society of London indeed formed a committee for defraying the expense of inquiries into the chemistry of gardening; but in two years it is not joined by a score of members! and we are persuaded that the great mass of that great Society regards the proceedings of the committee with no interest. The truth is, that English education—including that of Cambridge and Oxford—does not enable men to appreciate the value of such inquiries.

What, on the other hand, happens in Scotland, will be seen from an advertisement in another part of our Paper. A Mr. John Finnie, described as a farmer, and, we presume, one of those well-educated yeomen of whom England has so few, convenes a meeting to consider the propriety of subscribing a fund for the purpose of securing to Scotch farmers the services of a Chemist of eminence, who shall at all times be accessible to the subscribers, and who shall advise them chemically upon the matters in which they may be interested. Mr. Finnie's meeting is attended immediately by 18 noblemen and gentlemen of rank, certain resolutions are adopted, a subscription is entered into, and in ten days there are 242 subscribers, furnishing annually nearly 220*l*. a-year, in sums varying from 10*s*. to 10*l*. We hear of no idle apprehensions that science may prove a delusive guide; the Scotch farmer feels that he has skill enough to make use of science without allowing her to mislead him. We find no lukewarm expressions of a wish that the plan may prosper, coupled with a fear that it will not; no apprehensiveness that the gain to the subscribers may be less than the subscription of 10*s*. a year; no ignorant timidity. On the contrary, the eager support, not only of 16 noblemen, but of 70 farmers, is instantly volunteered, although their subscription gives them few privileges beyond that of being able to gain access to a thoroughly good adviser, for whose analyses and opinions they have to pay in addition. This is the kind of well-directed zeal which has led to success in other things, and which we may venture to predict will, in this instance, prove most advantageous to Scotland. We cannot doubt that a very short time will suffice to produce a sum sufficient for the accomplishment of Mr. Finnie's object; and we most earnestly exhort our Scotch readers to join the Association, for the sake of the best interests of their country.

"THAT fearful scarlet fever," says a clever lady of our acquaintance, "keeps one in hot water about every one's children. *We* have done our quarantine at T., and are now welcomed back into the bosom of our family and allowed to mingle in good society, without reproach or molestation. Aunt L., who is so afraid of infection, that I believe she wouldn't look at it through Doctor South's telescope, if one had it in the same street, has just got her eldest little girl through it, and *no one knows how she managed to catch it*. Is it subsiding in Eton and Windsor? The Queen could not go to Brighton, solely on account of its being so prevalent there. I talk and think so much about it, that I ought to write in red ink."

This, which is a genuine extract from the letter of a sensible, high-born woman, to her intimate friend, is too precious a morsel for us to part with, except to our readers of the *Chronicle*. The fair writer is one of those well-read, well-educated, persons, who are brilliant wherever they shine, but who know nothing of the nature of the elements that surround them. She cannot conceive how the child, nursed in the lap of luxury, and guarded by the most tender solicitude, could have caught the fever, which she regards, as well she may, with so much terror. She knows not that the angel of death is nourished by the misery of the poor and the culpable neglect of their overseers. She talks of the Queen hastening to Windsor to avoid some imaginary danger at Brighton, but she does not dream of Windsor itself being the centre of contagion. She sends her only son, the heir of a noble house and large possessions, to Eton, never suspecting that in the neglected ditches of that very place are a thousand demons of pestilence, ready to rise into the air the moment the Genius of the fever shall call them up.

If this lady, and such as she, did but know the true source of the dangers that surround them, how long would the starving labourers be unemployed? And yet it is certain that there is not a stagnant pool, nor an offensive sewer, nor one mass of decaying animal matter, that may not bear the death of some one on its exhalations—*that* one may be a royal infant at Windsor, or a noble boy at Eton, as well as a ragged urchin in St. Giles's.

SIGNS of good are gathering fast, and promise a happier winter than we anticipated. At An agricultural meeting the other day at Steyning, the Duke of Norfolk being in the chair, we find that Mr. H. D. Goring, much to his honour, proposed as a toast "The labourers of Sussex." This event, although we do not find it noticed in any of the daily papers, except the *Times*, is one of no little signification, and deserves to be permanently recorded. We are not informed of what further took place on this occasion; but we trust that all who were present will act upon the sentiments conveyed in Mr. Goring's toast.

It is of the utmost importance to society to put the agricultural labourer in a better position, to increase his comforts, and to give him a stake in the country; a consideration which, we fear, has been too much lost sight of. After all that capital can procure, and skill direct, and science advise, the owner of land is utterly undone without the active and willing aid of a stout and well-disposed peasantry. It is a frightful mistake to suppose that one sort of labourer is as good as another, or to regard a man as a mere machine, out of which a certain amount of brute force may be extracted, if an equivalent amount of cooked food is put into it.

Labour must be the foundation of agricultural prosperity: we cannot plough, and reap, and sow, or feed cattle, or do any of the main operations of cultivation, by driving a steam-engine. *We must* trust to *hands* for their due performance; and it makes a very serious difference whether those hands are willing or reluctant. If we strip the Pacific of guano, or Peru of nitrate of soda, or India of saltpetre, or exchange the hills of Surrey for the phosphate mounds of Spain, we shall have done just nothing at all without labour; while, if we have but enough of that, we may even leave these products in the countries where God has placed them. The following case, mentioned in a country paper, is a pretty good illustration of this:—"In the village of "Tatenhill, near Burton-on-Trent, the following "excellent—we might say, unparalleled—crop of "Wheat has been grown during the present summer, "in his garden, by an industrious cottager of the name "of Stanley. The quantity of ground sown was barely "9½ digging roods, or about 600 square yards, something less than one-eighth of an acre. On this ground "was dibbled last autumn one gallon only of Wheat. "During the succeeding winter, the plants appeared "weakly; but after a spring hoeing, which, the "Wheat being set in conveniently-distanced rows, "was an effectual one, they improved with astonishing "rapidity. On reaping the crop, it was found to produce upwards of 8 imperial strikes, or at the rate of "more than 65 bushels per acre! It should be understood that the ground was not in first-rate condition."

It may be very true that this is an unusual case, and that spade-husbandry will not do the same elsewhere. That may be; but it at any rate shows that abundant labour will produce abundant return.

WE are desirous of collecting evidence concerning the working of the allotment system; and shall be greatly obliged to those of our readers who may favour us with a full detail of the facts within their knowledge as to its operation—whether beneficial or disadvantageous. The size of the allotments should in all cases be stated. Such information as we possess is very favourable to the system; but we presume there must be instances of its working ill; and we are anxious to know what those instances are, in order that we may not hereafter, when we take up the subject formally, give a false colouring to the statements we may have to make.

ON MANURING WITH GREEN CROPS.—No. III.

(By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

(*Continued from page* 820.)

2. *White Lupine* (Lupinus albus).—Although Lupines are much used in Italy and the South of France as green manure, their use is very circumscribed in this respect in the North of Europe. Mr. Wulffen, of Pitzpuhl, near Magdeburg, has acquired some celebrity by proving, on an extensive scale, that Lupines belong to the plants which are capable of improving barren sandy soils. The effects of this practice are indeed so striking at Pitzpuhl, that even the small farmers have followed his example for some time past. Mr. Wulffen has published an interesting account of his proceedings. The following are some of my own experiments, which I also have made with great success:—

If Lupines are cut when the first pods are already formed, the Magdeburg acre will yield on an average 15-16,000lb. green herbage, 1000lb. of which consist of

800·0lb.		of water in fluid form.	
4·3	,,	nitrogen (contained in the organic matter),	
1·0	,,	potash.	
1·6	,,	soda.	
2·5	,,	lime.	
1·0	,,	magnesia.	
1·8	,,	phosphoric acid.	
0·5	,,	sulphuric acid.	
0·1	,,	chlorine.	
100·0	,,	carbon.	contained in the organic matters.
74·2	,,	hydrogen and oxygen	
3·0	,,	silica, alumina, manganese, and iron.	
1000·0lb.			

16,000lb. of green Lupines will consequently convey into the furrow slices of one acre 70lb. nitrogen, 16lb. potash, 27lb. soda, 40lb. lime, 16lb. magnesia, 28lb. phosphoric acid, 8lb. sulphuric acid, 2lb. chlorine, and 1760lb. carbon; all which substances must have an effect on the crops subsequently grown. It is especially the nitrogen, potash, soda, phosphoric acid, and carbon, which advance vegetation. Whilst 4,000lb. of green Spurry will afford the soil 16lb. of nitrogen, 16,000lb. of Lupine will convey 70lb. to the soil—which is the best inducement to grow Lupine, because all substances containing nitrogen are essential to the nourishment of plants.

One of the most valuable properties of Lupines consists in the roots penetrating to the depth of 24 or 26 inches, and thus bringing substances to light which are as good as lost to corn crops, whose roots under ordinary circumstances do not reach deeper than 12 or 15 inches. Lupines suffer also little from heat, partly because of their deep roots, and partly because they attract much moisture from the atmosphere. This success, moreover, is the more certain because they are never laid, and do not suffer from insects. They, however, do not grow very fast, and if we want to obtain a considerable mass of herbage (say 16,000lb. per acre and more), they must be sown in the beginning of May. It is only after three and a half or four months' growth that they are fit to be ploughed in—this being the period when they form their second blossoms. If they are intended to seed, they must be sown (on dry land) in the middle of April. I have grown Lupines on a humous burning soil to the height of 7½ feet, but generally they are not more than 3 or 3½ feet high. But however well the Lupines will succeed in loamy, sandy, humous, and clayey soils, marley or calcareous soils are not at all suited to them, probably owing to their being compelled to absorb more lime and magnesia than they want—their roots emitting an acid which renders these earths very soluble in water. They succeed best on land with a subsoil containing much iron, which is explained by the fact that 1000lb. of the herbage required nearly 1 lb. of iron for its chemical constitution. Lupines are more especially useful on clayey lands, which their copious herbage and also their roots loosen considerably. The quantity of herbage is so large, that it acts (as I know from experience) in the second year; whilst the action of Spurry is gone after the first year. The Rye which I grew after Lupines stood always as well as after a strong manuring of dung. Before being ploughed in, it is best to mow them down, and draw them with a rake or some such instrument into the furrows, which will insure their being thoroughly buried. The field can be sown immediately, or it may wait a few days, till the soil is somewhat settled. As the seed of Lupines is coarse, 100 or 110lb. are required per Magdeburg acre. It is well known that no cattle will eat them, so that they can only be used for green manure. In Italy, the seeds of Lupines are deprived by hot water, or roasting, of their germinating powers, and then are used for manuring sick Olive trees, &c.; and it is probable that they will be equally beneficial to old Olive trees. (?)

(To be continued.)

FIXING AMMONIA.

I have so frequently been applied to by practical persons desirous of knowing how much of this or that substance is required to fix a given quantity of ammonia, that I have thought the following simple rule may be of service to many of your readers. I need hardly observe that the use of chemical re-agents or tests is inconvenient, where the operator is a working man, not versed in the use of these substances. What is required is a plain, simple, and cheap method of ascertaining whether or not a liquid contains free ammonia. The following method answers well, and is easily applied :—

Take a teaspoonful of common turmeric powder, and mix it into a thin paste with a little water; keep aside one half of the greenish yellow paste thus formed, and mix the remainder with three or four times its bulk of the liquid to be examined. If it contain any free ammonia, the liquid becomes immediately of a reddish brown colour; the depth of the colour depending on the quantity of free ammonia it contains: upon the addition of a few drops of any acid the ammonia will be neutralised, and the turmeric will return to its original yellow colour. I have never recommended turmeric paper as a test of free ammonia, as it is hardly suitable for common use. I find, however, that the powdered root is so convenient an indicator of free ammonia in liquid manure &c., that I do not hesitate to recommend it.

The value of any acid or other substance as a fixer of ammonia may be well tested in this manner; the liquid must be mixed with a little of the powdered root, which it will immediately redden. The value of the fixer, or the quantity of it required for any quantity of the manure, is known by observing how much of it must be added to bring back the original yellow colour of the turmeric. Turmeric-root may be procured at almost any Chemist's; if only the whole roots can be obtained, they are readily rubbed to powder on a common grater, like ginger.—*E. Solly.*

EMPLOYMENT FOR COUNTRY LABOURERS.

I am glad to find you advocating so earnestly the cause of the country labourer; and I agree with you in thinking that in no way could he be so usefully employed as in furrow-draining, by means of tiles or faggot-wood, or, in the case of pasture-land, of turf. I would farther suggest, that where neither stones, bricks, tiles, wood, straw (as in Essex), stubble, leaves, nor turf can be got, the surface soil, which has been long under the plough, and can be taken from the crowns of the ridges and thrown into the drains made in the bottoms of the furrows, will admit of the water running through it for a number of years, and may be worth adoption by a farmer whose lease has only five or six years to run. I have known such drains in the neighbourhood of Edinburgh, on loamy soil, to last for seven years.

Besides draining, there may be mentioned as sources of employment during the winter, stocking up old hedges, hedge-banks, and hedge-wastes, which will supply a mass of soil, that when mixed with lime, will form a valuable compost, while the roots may be given to the labourers as fuel, and the tops may be used in fencing or in draining. Old coppice-woods may also be stocked up, to be changed into grass or arable land; and new plantations, as substitutes, may be made in other parts of the estate, the ground being previously drained and trenched.

Another source of employment may be found in cutting off, close to the trunk, the dead stumps and dying branches of the Pine and Fir tribe in plantations. There are hundreds of acres of Scotch pines and larches in every part of the country, with the trunks studded with the remains of dead branches from the ground to the height of thirty or forty feet. Nothing can be more unsightly than the trees in plantations of this kind; and though cutting off the stumps close to the stem might not greatly improve the quality of the timber already formed, seeing that a portion of every dead stump is already surrounded and in part buried by live wood, yet it cannot be denied that their removal would greatly improve the appearance of the trees, while the stumps cut off would be valuable fuel for the labourer.

The last suggestion which I would make with a view to benefiting the country labourer is, that of paying him partly in money and partly in bread corn, a practice which has been followed in Scotland and Northumberland from time immemorial, and which was also, I am informed, the practice in Norfolk, Suffolk, and other parts of England, till about the commencement of the present century, when the great rise in prices tempted the farmers to give it up and pay solely in money. It is almost unnecessary to say, that the advantage of paying partly in bread corn is, that whether the money price is high or low, the labourer has always the same quantity of the staff of life, and is consequently always well fed and fit for his work. I grant that a recurrence to corn-payments, whether of wages or rents, is a retrograde step in political economy; but so long as the fluctuations in prices of the necessaries of life continue, this mode of payment is justifiable by its expediency.

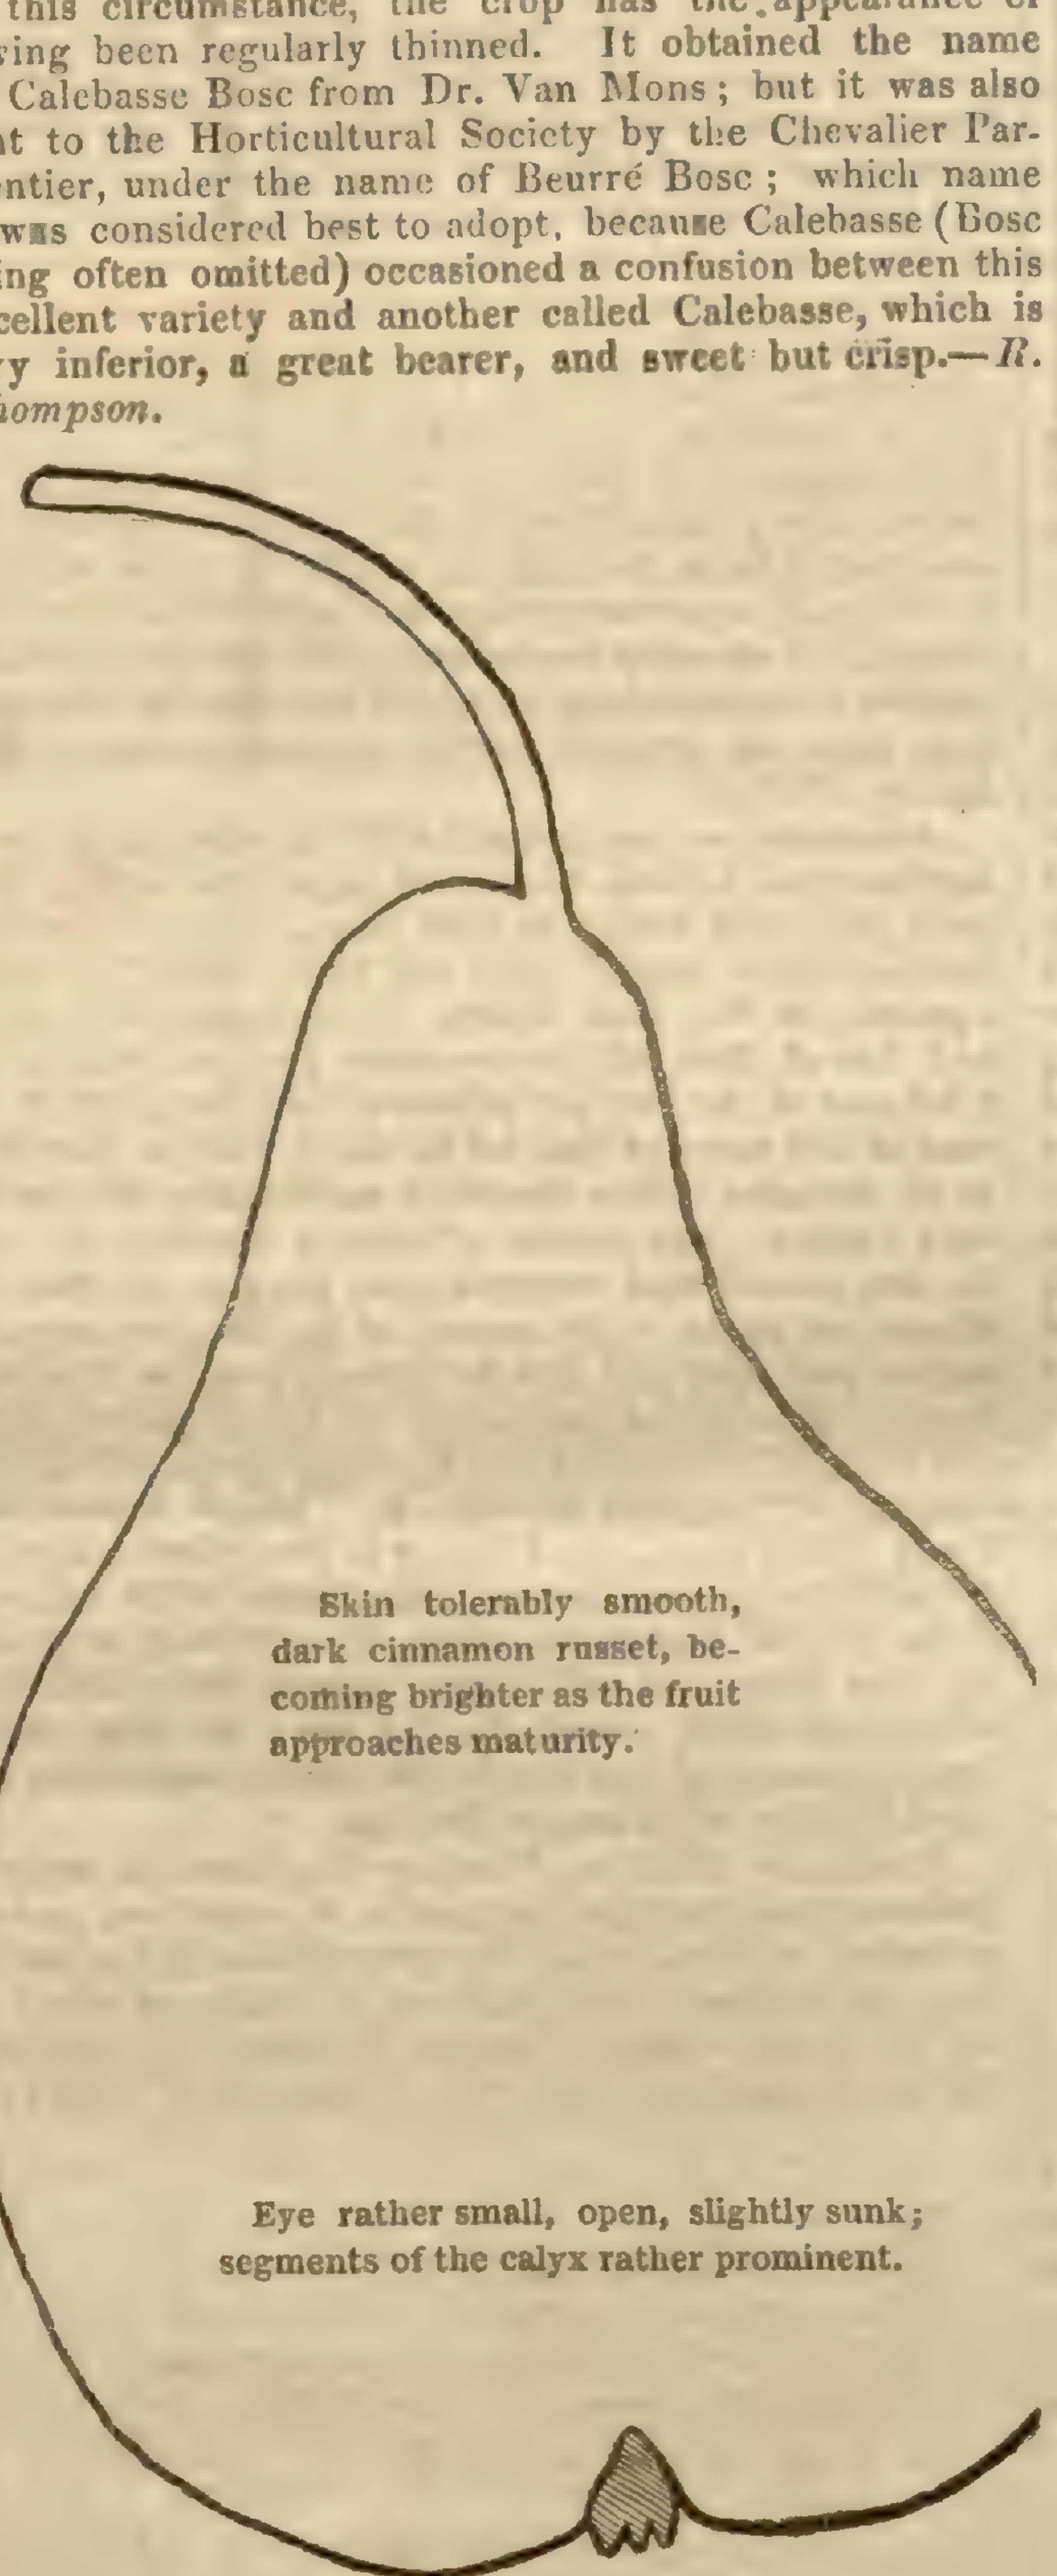
I will add one other suggestion for the benefit of labourers [illegible], which is, that, instead of pur[illegible] [illegible] would purchase wheat, and have it [illegible] their own bread. Half-a-dozen or a [illegible] together, purchase a quarter of [illegible] after it was ground, divide it equally among them. I have ascertained, from persons who practise this mode, even about London, that genuine wheaten bread may thereby be obtained at considerably less cost than it can be procured at the bakers' shops—

J. C. Loudon, Bayswater.

BEURRE' BOSC.

Calebasse Bosc, Beurré d'Yelle (of some), *Marianne Nouvelle, Bosc's Flaschenbirne.*

The accompanying outline represents the average size from a standard, and the usual form of this excellent Pear. The stalk is from 1¼ to 1¾ inch in length, and curved. The surface of the fruit is somewhat uneven; yet, over the inequalities, the skin is tolerably smooth. The flesh is yellowish white, melting, buttery, and sugary, with a rich cinnamon flavour; in perfection in October and November. The tree is of vigorous growth; shoots light olive, with a sprinkling of large pale brown spots. The flowers are remarkable for the long elliptical form of the petals, so narrow that they do not touch each other when expanded. The trees bear well as standards; in general, the fruit is produced singly; that is, not in a cluster from the same bud. Owing to this circumstance, the crop has the appearance of having been regularly thinned. It obtained the name of Calebasse Bosc from Dr. Van Mons; but it was also sent to the Horticultural Society by the Chevalier Parmentier, under the name of Beurré Bosc; which name it was considered best to adopt, because Calebasse (Bosc being often omitted) occasioned a confusion between this excellent variety and another called Calebasse, which is very inferior, a great bearer, and sweet but crisp.—*R. Thompson.*



Skin tolerably smooth, dark cinnamon russet, becoming brighter as the fruit approaches maturity.
Eye rather small, open, slightly sunk; segments of the calyx rather prominent.

HYACINTHS IN POTS.

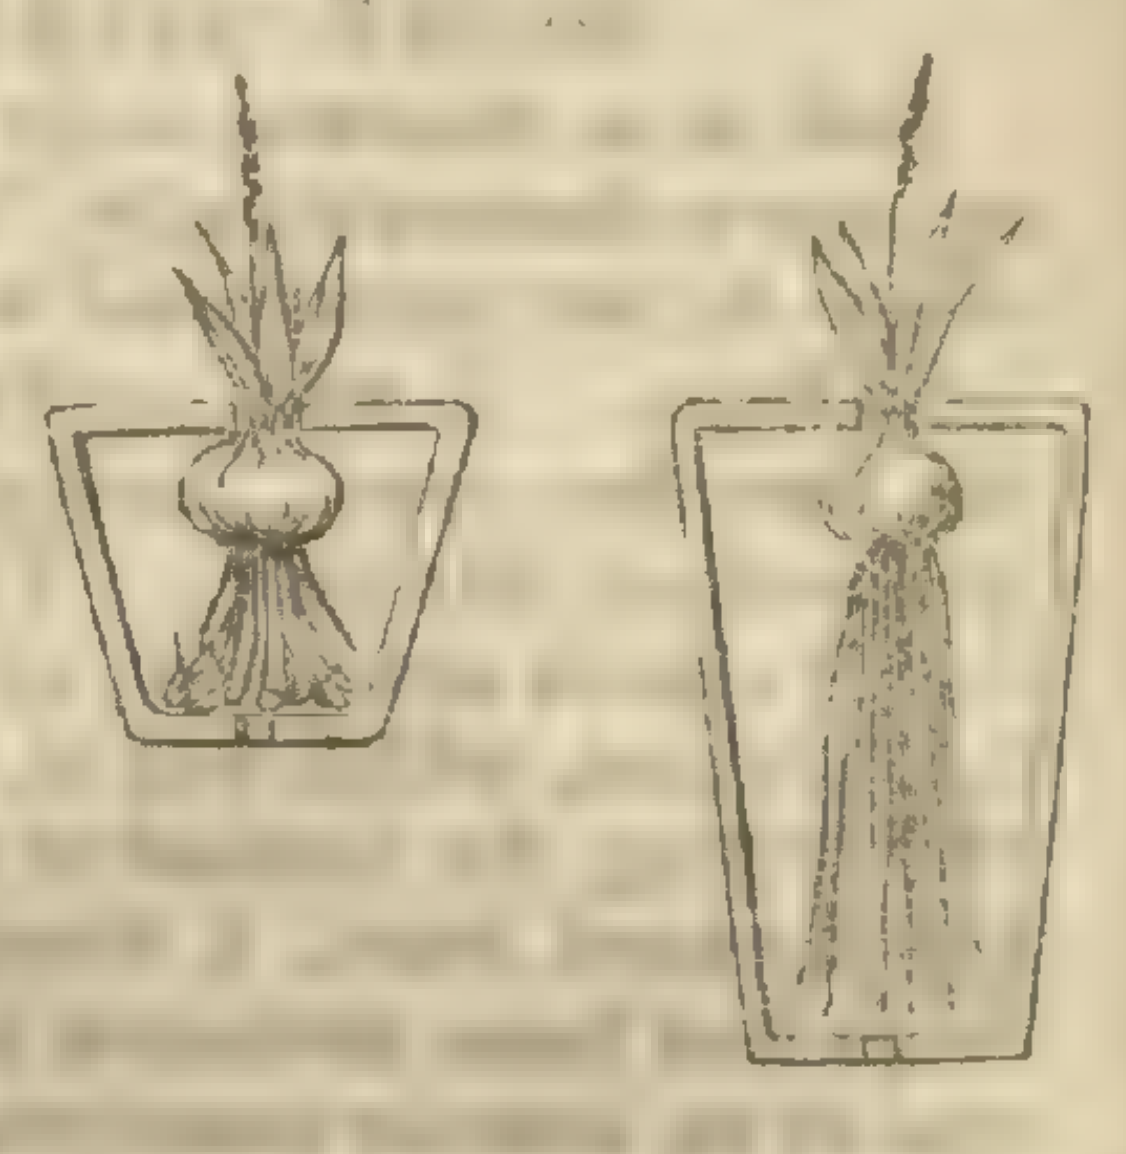
As far as relates to planting Hyacinths in the open border, nothing can be better than the directions given upon that subject, at p. 741, by Mr. Storm, to an English nobleman; but as no notice is taken of the way in which we most frequently see them grown in this country, namely, in pots, and as the number of those who attempt to make a bed of these beautiful flowers is comparatively small, I trust I may be allowed to suggest a few observations regarding their cultivation in pots. In order to do this successfully, it is requisite to consider the native country and habits of the plant, without which we cannot hope for success in cultivating them.

The Hyacinth is believed to be a native of Persia, where it inhabits sandy plains, parched up with drought in summer, and exposed to heavy rains and occasional frosts in winter. Its season of growth begins with the first autumnal rains, at which period it emits long white succulent radicles from its circular bulb, 12 or 18 inches in length. These maintain it through the season of flowering, after which the increasing heat of the sun dries up the earth; and whilst the accumulated sap in the centre of the root is preparing the future flower for the next spring, the bulb remains apparently dormant, surrounded by warm dry sand. From hence we may see the necessity of taking up the bulbs, and of preserving them in a warm dry place during our English summers, which are nine times in ten so wet as to cause the decay of the bulb, when surrounded by moist rich mould, at a time when its natural habits require quite the reverse.

The ordinary treatment we subject them to is, indeed, as unsuited to their nature as possible. They are sometimes placed in water-glasses, and excited by the heat of a dwelling-room or greenhouse; while at the same time little or no nourishment is afforded them by pure water. It is, therefore, obvious that the flowers and young leaves must be chiefly supported by the substance of their own bulb (stored up the previous year); how then can we wonder that the plant becomes debilitated, the bulb shrivels, and it is found incapable of blooming the next season? Nor is the fate of those placed in pots for forcing much more lenient; the pots being generally very shallow, and, in many cases, scarcely twice the size of the bulb. The tender radicles, on shooting downwards, are cramped and forced to become twisted back upon themselves; they encounter the drainage of broken potsherds, and frequently force their way through the hole at the bottom of the pot. In all these instances they meet with an irregular or deficient supply of food, and the plant consequently suffers.

The bloom being faded, the bulbs are either thrown away as useless, or, having been forced early by artificial heat, they are put into some cold, damp, dark place, (perhaps exposed to cutting cold winds in March), to be out of sight; or, if intended to be preserved, they are planted in the open ground to recover themselves—a remedy worse than the disease.

To obviate these evils, and to save many valuable and beautiful roots from perishing, it is only necessary to attend to two or three points. Firstly, to give a light free soil, mixed with a little leaf-mould and sand, of which they are very fond; and next, which is not less important, to give them enough space to grow in without starving their roots. The easiest way to do this, is to have pots made of a deeper shape than those in common use, which may be understood by the accompanying drawing. By this simple arrangement the roots have sufficient nourishment, while the pots take up no more space on the stand than at present. An inch or two of very rotten cow-dung may be put at the bottom of the pots, to promote the richness of colour and perfume of the flowers. Three or four bulbs may be planted in the same pot; but it is essential that the latter should be sufficiently large and of the requisite depth; twice the diameter of the top is a good proportion.



Lastly, after the bloom is over, put those which are fine varieties and worth preserving in some warm and light place; the top shelf of a hothouse, greenhouse, or vinery, close to the glass is the most preferable. There they will require no more care nor watering; and, after the leaves wither, they may be sorted and put by until the planting season returns. If these points are attended to, I can say from experience that Hyacinths will suffer but little from forcing, and will flower again the next year; not quite so finely, perhaps, as at first, but still far better and with greater vigour than under the common hard and cruel treatment; being first starved for want of food, and then chilled with wet and want of sunshine.—*C. D.*

AMATEUR'S GARDEN. No. LIII.

The temperature of the air in the evening must now be carefully attended to by those who have a greenhouse or pit to manage. A thermometer hung out in an exposed part of the garden should be looked at frequently whenever there is any appearance of frost. Mats used for covering the frames are very delicate indicators of a change of temperature, and frequently become stiff and glossy, even before the thermometer falls to the freezing point. Those, therefore, who have not a spare thermometer to hang out in the open air, may easily be guided by a piece of wet mat placed in an exposed situation. Chrysanthemums which are fading may be cut over and removed from the greenhouse to a cold frame or any place, where they are slightly protected from severe frost; in this situation they will send out numerous shoots, from which cuttings may be made at the proper time. Remove all dead or decaying leaves from plants in cold frames, as the disease is infectious, and communicates itself to other leaves in the same manner as rotten fruit on the shelves of a fruit-room. Such places should be freely exposed to the air when the weather is fine and mild.

After the holidays are over, out-door alterations may be proceeded with when the weather is favourable. A piece of rock-work is very interesting in a garden, when it is placed in a proper situation and constructed with taste. In some retired part, near a lake or stream,—or in other situations, where from the nature of the surrounding scenery we are led to expect something of the kind,—the effect it produces is very pleasing. It would be out of character if placed near fine architectural buildings, or where the ground has a very artificial appearance, and instead of adding beauty and interest to the scenery, would mar and destroy the effect of the whole.

I have now had the pleasure of accompanying the amateur, and directing him how to proceed with the varied operations of his garden, from the commencement of the year until its close. The orchard and kitchen-garden, the flower-beds and borders, the greenhouse, pit, and frame, have all come under observation; and I have always studied, as much as possible, to give plain directions on those subjects with which I have supposed him to be least acquainted. Window-gardening, also, has been frequently adverted to for the benefit of those who have not the convenience of a greenhouse or frame,—even at the risk of displeasing the medical man, whom the *Quarterly Review* describes as "the man of science, who speaks some weighty words on oxygen and hydrogen," and gets the poor pet plants banished for ever from the room of his patient where they are most enjoyed. [See a Leading Article at p. 571.]. The principles or theory of gardening have been also frequently brought under observation with the view of making them go hand-in-hand with practice. Doubtless a man who only knows the practice, without the principle, may succeed with certain operations; but, like the quack doctor who cures by chance, he also injures and destroys in the same blundering way, and is deprived of all the pleasure which is felt in knowing the reason why he kills or why he cures. Plants, like animals, are living and active beings; they have a period of youth and of age—are born and die; their organisation alike resists decay as long as the vital principle exists; but when that ceases to act, both return to the elements out of which they were originally composed—earth, air, and water. The principles which regulate the growth of plants are few and generally simple; and, if they have been rightly understood, the amateur will be enabled to test his own practice, as well as that which may be recommended to him by others.

In conclusion, although our walk has been in many respects a pleasant one, we must now, for a while at least, part company. It is sincerely trusted, that the efforts which have been made to increase the comfort and happiness of the lover of gardening have not been made in vain; and that while he has enjoyed the fresh breeze and healthful exercise of the gardener's life, he has also seen more of the wisdom and goodness of the great Creator, and has been thus taught to "look from Nature up to Nature's God."—*R. F.*

HOME CORRESPONDENCE.

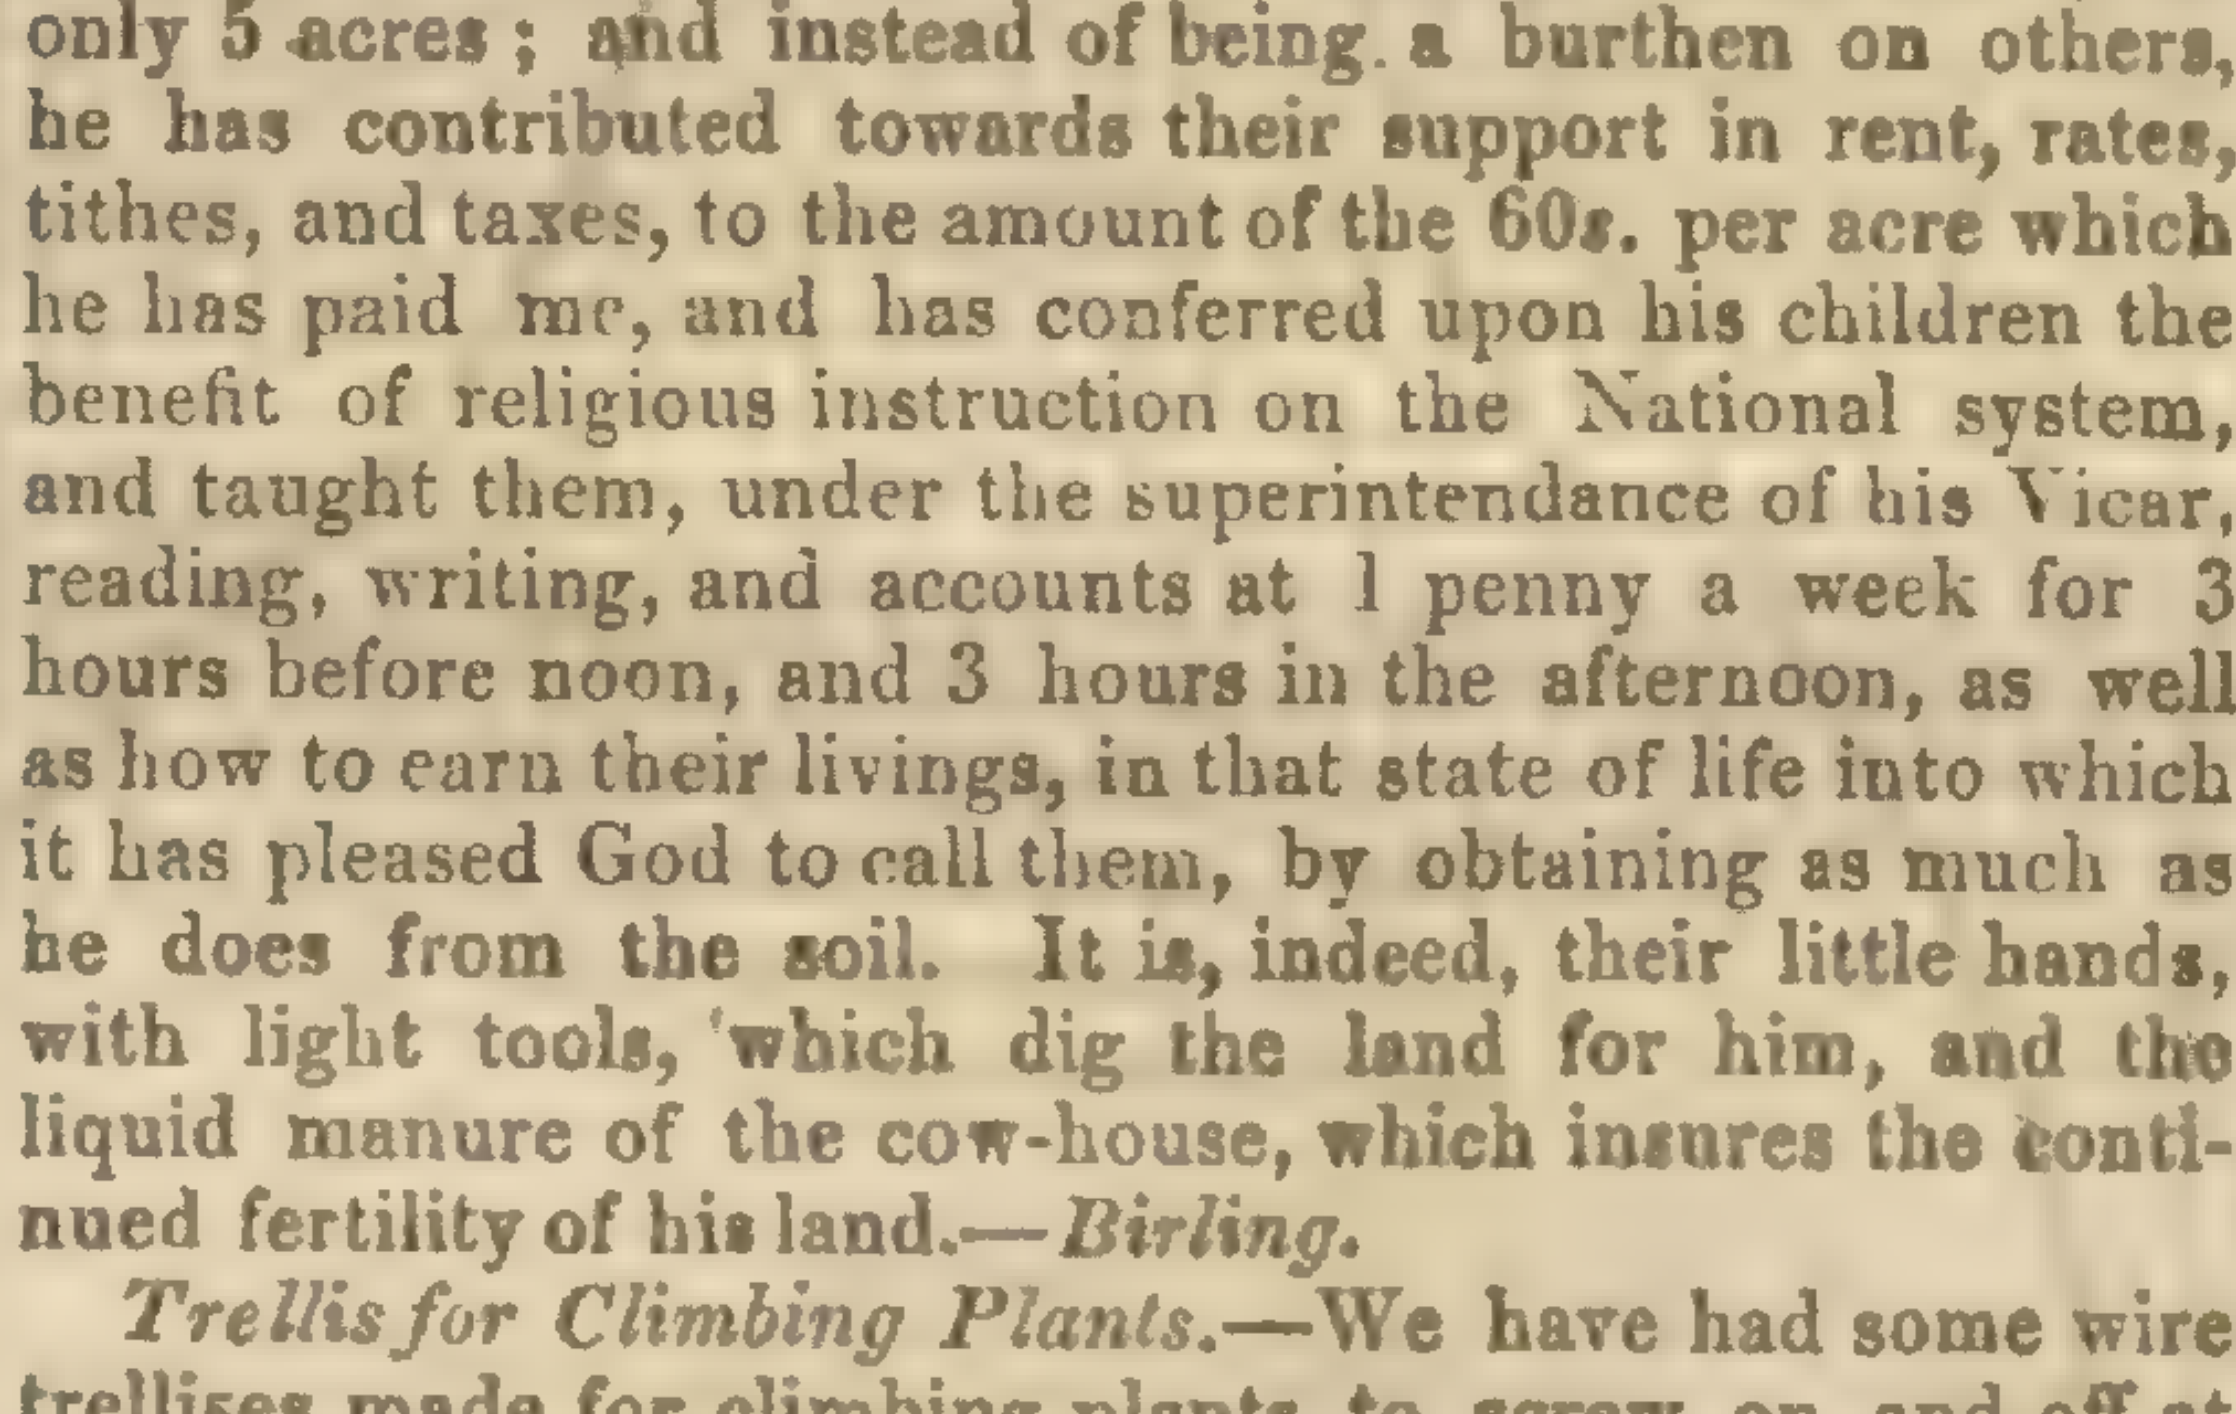
Salt as a Manure.—At p. 806 of the *Chronicle*, there are some observations by "Quercus," on salt as a manure, which do not correspond with what I have experienced of its effects. I will confine myself to the experience of the last five years, during which time I have been head gardener at this place. The garden lies low, is very damp, and if care is not taken, abounds with black slugs. When I first came, which was in the month of June, its produce was trifling, for instead of onions, carrots, and peas being in a forward state, I found that the greater part of the crops had been devoured by slugs, and that the remainder was of an inferior description. I immediately commenced manuring the ground with *Salt*, and cropping it as fast as the salt disappeared from the surface. My crops, under this treatment, improved rapidly; and from that time, I have had abundance of excellent vegetables, which have received the first prizes at the Horticultural Shows of Blandford, Weymouth, and Sherbourne. Manuring with salt has completely destroyed the slugs, and all my crops have been good, both in size and flavour; which I attribute in a great measure to the use of *Salt*. Many gardeners in this neighbourhood have adopted the same course, and it is with difficulty that I can now procure *waste* or refuse salt for money, when but a few months back I could almost have obtained it for the carriage. I do not mean to assert that I use no other manure, but that I consider *Salt* as the principal cause of my good and clean crops, and that it is a great saving of dung. "Quercus" entertains a bad opinion of salt as a manure, and appears to expect that your readers will consider his arguments as unanswerable, because he has been enabled to find in the Bible, some allusion to its nature. I am not prepared to argue with him as to its effects on vegetation; he appears never to have given it a trial; but as he plumes himself on his scriptural research, I should be thankful to him if he would explain the nature of salt that "has lost its savour." On the sea coast, especially in Northumberland, the farmers use seaweed as a manure, which is esteemed principally on account of its saline properties. To me, it appears to be entirely a question of quantity: "a salt land not inhabited," as described in Jeremiah, chap. xvii. v. 6, is perfectly intelligible; neither would a land of lime, a land of bone-dust, nor a land of guano, nor, in fact, would any land prove productive if overcharged with a powerful manure. Is not an Apple-pie improved by having a Quince put into it? Is not the food we eat made more palatable and nourishing by the addition of a limited quantity of Salt; and so is land rendered more fertile by the judicious aid of this and every other manure.—*Wm. Brewis, Gardener to R. B. Stendon, Esq., Frampton.*—[We quite agree with this correspondent. No doubt can possibly exist as to the value of Salt as a manure, if applied in small quantities, and where it is wanted.]

Daniell's Manure.—Where this has been properly applied, it has in some instances been of considerable use; and although the season has been much against it, yet when buried to the depth of an inch or two beneath the soil, it has been of great advantage to wheat and turnips. Most of the experiments made by farmers in this neighbourhood were conducted in a careless manner; not half of the manure was buried, and consequently all the nutriment of the exposed portion was quickly absorbed by the atmosphere. Mr. Daniell's crop of wheat was excellent, but great pains were taken by him both in burying the manure and in sowing the seed. He is now giving it the sixth trial on the same land. I have seen a good crop of potatoes produced by the aid of this manure upon a poor shallow soil, which previously would scarcely pay for cultivation. Half an acre of loamy arable land was also divided into two equal portions, and planted with potatoes; one of these was treated with stable manure, the other with Daniell's; there was no perceptible difference either in the crop or flavour of the tubers, but the artificial manure produced most haulm. To shallow upland I think it will be of great benefit, when properly applied; but although carefully tried upon pasture lands in three different ways, it produced no beneficial results. Mr. Daniell is making, and has sent out, great quantities of it. It will be of no benefit in gardens where the soil is loamy.—☞ *Bath.*

Forking Land.—I am glad to find that you are an advocate for spade and fork husbandry. Two years since, I introduced the latter implement here, and it is fast superseding the spade. Mr. Mitchell, of Wymondham (who, I believe, farms largely with the fork, and who has written a pamphlet on the subject), was kind enough to send me half-a-dozen of these instruments, which are readily manufactured by any smith. They weigh 7lbs., and have three tines, 14 ins. deep. Fair-working soil may be turned up to that depth with this fork, and the labourer will earn good wages, at 2½*d.* per rod, which is 1*l.* 13*s.* 4*d.* per acre. I recommend, however, for agricultural purposes, that the plough should precede the fork by turning over a wide furrow 5 or 6 inches deep; the next to be turned over with the fork. The plough, in preparing the succeeding furrow, covers the work done by the fork. In this way the supersoil is not buried, which is a desirable object where the subsoil is not of a fertilizing quality. This is an admirable plan for Potatoes, Carrots, and all plants which require a greater depth than can be given by the plough, and has the advantage of not being above half as expensive as double trenching by the spade, which often costs 1*s.* per rod, especially in preparing ground for plantations. For obvious reasons this deep cultivation will be injurious, unless the soil be naturally dry or well under-drained. I shall be happy to give any of your readers any practical information which I possess, or I would send them, through my smith, the forks, which are 4*s.* 9*d.* each, upon the receipt of a post-office order for the amount. I strongly recommend this plan for garden cultivation; and in taking up the White Belgian Carrot, the fork, from its strength, is the best instrument.—*Henry Dixon, Witham.*

Allotments.—I am pleased with the success of my last Agricultural School, which was begun last spring, at my son's particular desire, at East Dean, by John Harris, the Sunday-school master; who had been, owing to ill health, a pauper in the East Bourn Union-house, with his wife and five of their children—seven persons, who at 3*s.* a head cost at the rate per annum of 54*l.* 12*s.*; which is the rent of 273 acres of land let as sheep-walk at East Bourn at 4*s.* per acre. Now Harris is maintaining his family on only 5 acres; and instead of being a burthen on others, he has contributed towards their support in rent, rates, tithes, and taxes, to the amount of the 60*s.* per acre which he has paid me, and has conferred upon his children the benefit of religious instruction on the National system, and taught them, under the superintendance of his Vicar, reading, writing, and accounts at 1 penny a week for 3 hours before noon, and 3 hours in the afternoon, as well as how to earn their livings, in that state of life into which it has pleased God to call them, by obtaining as much as he does from the soil. It is, indeed, their little hands, with light tools, which dig the land for him, and the liquid manure of the cow-house, which insures the continued fertility of his land.—*Birling.*

Trellis for Climbing Plants.—We have had some wire trellises made for climbing plants to screw on and off at pleasure; so that during the season of rest of Tropæolums, &c., the trellises can be removed to a place of safety without the incumbrance of the pot attached. A reference to the accompanying sketch will, I think, show what I mean.



I have no knowledge whether or not this is an original idea, but I have never before heard of its having been adopted by any one.—A is a screw to fit B; B, the screw-socket; C, a section intended to represent the convexity of the front, which thus shows the flowers to great advantage.—*Charles Noble, Gardener to R. Mangles, Esq., Sunninghill.*

Creepers for Verandahs, &c.—During the winter months I think it would be desirable if your correspondents would amuse themselves, and impart a little instruction to your readers, by giving the result of their success during the late summer, in blooming different plants; at all events, I will give you mine, in the selfish hope of obtaining information, as I fear I can impart none. To the door of my cottage, fronting the south, I have a verandah, or porch, made of oak branches; and not knowing what kind of a summer we should have, I took care to have such a variety of creepers that some would be sure to succeed. I planted a Bombay (?) Rose, which thrived amazingly, but did not flower, as it was its first year; also the Tropæolum tuberosum, which grew well, but as a matter of course did not bloom. I planted it, by way of experiment, in poor soil, but I suppose not poor enough. I had also Clématis flámmula, which, being young, made little progress; and, to crown all, I had a plant of the Cobæa scandens, which answered my expectations in every way, covering the porch and climbing up a rough-cast wall to a very considerable height. I have been so delighted with it, that unless I hear of something as luxuriant, I shall be induced to have several next summer. To the north, west, east, and remainder of the south, I had wire-work (not wishing to spoil the wall with nails) about 6 feet high and 2½ wide, made in the form of an arch, the two legs being driven into pieces of wood which caused the wire-work to be firm in the ground. I planted against it the Sweet Pea, Tropæolum peregrinum, and the common Nasturtium; but as the Tropæolum grew so rapidly and flowered so beautifully, I threw the others away to give it more room. The Sweet Pea will not, I think, succeed well against wirework, as it seemed too cold for its tendrils. The Tropæolum peregrinum is so elegant in its foliage as well as flowers, that I intend to sow it up and down the garden, and put a pea-stick with it in the way one should plant Sweet Peas. I have now given the result of my experience, and shall be glad to learn how I can vary my Creepers for the verandah and wire-work; the former being suitable, but not the latter, for Creepers with delicate tendrils.—*J. R. W.*

Hacon's Incomparable Pear.—A friend of mine, in alluding to Hacon's Incomparable Pear, informs me that three years since, he dined with the late Mr. Wales, of Downham, who asserted that a Mrs. Rayner, 50 years ago, after eating a pear, went and sowed the seeds in the baker's yard, where the present tree stands, from which my friend took some grafts. He estimates the diameter of the tree to be 15 inches; it has also a large round top. Col. Mason formerly stated that it was raised from the Downham seedling by Mr. Hacon. I received scions from him, and also from the original tree, the history of which is just given. The fruit from both proves to be the same—a pretty conclusive evidence, as we all know how much seedlings are liable to vary. A curious feature of this Pear is, that the trees cannot by any means be made to bear until they are eight or ten years old; after which they bear freely and constantly. The blossoms will bear the sharpest frosts without injury.—*T. Rivers, Sawbridgeworth.*

Legg's new Early White Broccoli.—I beg to add the above Broccoli to Mr. Whiting's list at p. 810. I sowed a small bed the 17th of March last, and when the plants were strong enough, I planted out two rows each 30 yards long. About the middle of July I examined them, and found most of them showing flower; by the middle of August, several of them were fit to cut, being pure white, and as compact as any Cauliflower or Broccoli. They continued good till the last, there being only two bad ones amongst them. In such a season as this, it has been difficult to get good Cauliflowers during the months of July, August, and September, particularly the two latter. I think one sowing the middle of March, and another the first week in May, would ensure a succession till Cauliflowers came good again.—*William Hughes, Sherborne Castle, Dorset.*

Mushrooms.—It is not improbable that the cause of failure of J. D.'s Mushroom-bed, p. 712, was owing to the high temperature at which the house was kept. This would not only bring the Mushrooms prematurely forward, but also rob the bed of that moisture, which, under favourable circumstances, would have contributed to their nourishment. My case is somewhat different. The Mushroom-house is built upon the Oldacre principle, and is heated by a flue, the temperature averaging about 50°. The beds are seldom watered, but are covered with a slight coating of hay; the lower ones being filled with Rhubarb, Seakale, &c. In the forcing season the watering of the latter and an occasional sprinkling of the paths are sufficient to keep the atmosphere moist. In February, 1841, I had a succession-bed which had been spawned 6 weeks, and promised well. At the end of that period, a few Mushrooms with long stems and small leathery caps sprang up; the spawn of which soon spread over the rest of the bed. These I had cleared away, and had fresh soil spread over those parts of the bed which had been disturbed; but all proved unavailing. In materials, formation, and treatment, this bed was similar to two preceding ones, both of which produced abundant crops of excellent Mushrooms. Neither the exhaustion of the beds nor the temperature of the house could be the cause of failure in this instance, as the others kept on bearing abundantly at the same time. It seems also opposed to the assertion that the species of a Fungus does not depend so much upon the seed from which it springs, as from the matrix upon which it is nourished; in the present case, the nidus may be supposed to have been favourable for the production of the true Mushroom. I therefore concluded that the fault laid in the spawn, although it was from the same sample as that from which the other beds had been inoculated.—*T. Elliot, Knaresborough, Yorkshire.*

Rhubarb.—In a late Number of the *Chronicle*, "the true Tobolsk Rhubarb" is advertised by Messrs. Youell, who say, "this Rhubarb being the earliest in the open border by three weeks of any yet introduced, is rendered highly valuable for forcing." I beg to ask Mr. Youell, or shall feel favoured if any correspondent will inform me, whether there is not an earlier kind, as I have the Tobolsk and another sort, called the English Baron, in the open border. The latter has begun to throw up leaves already, and the Tobolsk has not yet made its appearance. It is probable that if the "Baron" be not protected, he will suffer. I intend to put over the plants large Seakale or Rhubarb pots, and when severe weather sets in, to give them a slight covering with dung; and if I succeed in this manner, I presume it will be superior to any forced in the regular way. I have a row of the Victoria which I began to force rather more than three weeks since; and after the dung had been about the pots a week, I found the heat too violent. I therefore took away the dung from the tops of the pots, that a portion of the heat might escape, and lifted off the lids, leaving them in that state for a few days. When I covered them up again, I despaired of having a crop, as the heat was excessive. The soil inside the pots was almost too hot for the hand, and the crowns of the plants appeared to be gone. Now, however, I have beautiful Rhubarb in every pot, quite ready for use. This account may seem "strange and unnatural;" but Rhubarb will bear almost any heat.—*A Young Gardener.*

Spontaneous Combustion of Moss.—A rather singular misfortune, the knowledge of which may not be useless to others, happened a short time ago in my small hothouse, which is heated by hot-water pipes. As tan is never employed, the gardener, by way of an experiment, packed a quantity of common moss round some of the larger pots, containing a Strelítzia reginæ, an Ipomœa Horsfálliæ, and a Dioscórea from Brazil, in order to supply them with bottom-heat. During the summer all went on well; but in the autumn, soon after the use of the hot-water apparatus was resumed, a very disagreeable smell was perceived, and one evening the house was found to be full of dense and suffocating smoke, such as issues from a brick-kiln. This smoke proceeded from the moss, which was partially in contact with the pipes, and which on being moved broke out into spontaneous combustion; having been apparently smouldering for several days. Strangely enough, the Strelítzia was uninjured; although its pot was blackened by the fire, which was strong enough to char an adjacent block of wood. Of the other plants in the house, many of them lost their leaves; Ipomœa rubro-cœrulea and another present a curious spectacle, being in full bloom without a single leaf, for the flower-buds were all unhurt by the smoke which turned the leaves black and spoiled them in the same manner as a frost would have done. Two or three Gesneras died, but the Amaryllidáceæ and Orchídaceæ were not hurt; the greatest sufferers were the exotic Ferns, some of which will, I fear, not recover; every one of them lost their fronds, but some are pushing up new ones. This will, I hope, be a warning to others against letting moss be in contact with pipes for heating.—*C. D., Sussex.*

Stewed Pears.—The best way to stew Pears is to pare them quite clean, without leaving even a pip behind, and then to place them with white sugar-candy in a block-tin dish, with a cover of the same metal. A small quantity of distilled water is to be added; and when thus prepared, the dish should be covered with enough paste, and put into an oven after the bread is drawn, where it is to remain until cold. The dish, when opened, will exhibit the Pears of a beautiful pink colour; which is easily accounted for, as the vegetable acid of the Pear holds in solution a small portion of tin, and produces this effect. Dyers well know that a good scarlet can only be procured by using an oxide of tin. I will leave you to judge whether the basin does not afford this metallic preparation in the course of stewing the Pears. Recollect that the success of the operation depends upon the absence of all extraneous matter beyond the Pears, sugar-candy, and water. Any flavour may be given to the Pears, but it must be prepared independently of the stewing, and added after the operation. —*T. H.*

A Problem in Cookery.—Respected Sir,—My friend at the Hall has this morning sent me your *Chronicle* of Saturday last, in which there is a letter with my signature. I need scarcely assure you, Sir, that it is altogether a wicked fabrication, as it is obviously impossible that I could have written it. Without troubling you further on this unworthy subject, I may inform you that since I first took the liberty of addressing you, I have met at the house of my neighbour a gentleman who is, I believe, a real philosopher, and who kindly condescended to explain the matter to me. He told me, that all the time the pie is in the oven, there is a constant pressure outwards from the cup; arising in the first instance from the expansion of the included air, and afterwards from the production of steam. That, therefore, during the whole process of baking, the juice must be lower within the cup than on the outside, and that consequently it produces an effect the reverse of preserving the juice, except in so far as it keeps the crust elevated above the bubbling liquid. He told me that I might obtain this latter advantage without the disadvantage, by having a cup with a small hole, like that made in the lid of a teapot. He explained this at greater length than I have given it, to suit my inferior capacity in these matters, and I feel sure that he is right. I see now also that your joking about the inquisition was to enable you to avoid, as politely as possible, giving any direct answer to what you deemed the foolish question of *An Old Lady.*

Boiling Sweetmeats.—The following is a safe way to make marmalades, and similar sweetmeats that require to be boiled, without the trouble of stirring, or the risk of being burnt. The copper pan, which holds the marmalade, should be placed in a block-tin pan, about two inches wider in circumference, at the bottom of which, and soldered on the inside, there should be four little pegs, an inch and a half high, to prevent the copper vessel from touching the bottom. This outer pan should be half-filled with strong salt and water (two parts of water and one salt,) so as to make very strong brine. The advantage of this is, that the salt and water can be heated to a hundred degrees above the common boiling point; by which means the sweetmeats are boiled without the possibility of being burnt or the trouble of stirring. This plan has been adopted for two years with perfect success.—*S. E. D.*—[Our correspondent is under some missapprehension Her mode of boiling, which is the same as that of a glue-pot, may be very good; but the boiling-point of salt and water is not 100° above that of water. The boiling-point of water holding 30 per cent. of salt in solution is 224°, not 312°.]

Weight of Poultry.—Should *J. C.* or *Geo. W.* have any further communication to make upon this subject, perhaps they will give some clue to the part of England of which they speak. I have got a duck and drake which weigh 13 lbs., or the duck 6 lb.—drake 7½ lbs. These are the common blue drake and grey duck of this country, and I am told that there are several to beat mine. Perhaps "Geo. W." would let me know what is the weight of the "Rouen Duck;" as my wish is to procure the largest duck possible free from the Muscovy breed.—*T. O. G., Liverpool.*——I have recently measured a drake and duck of the common English breed, raised by myself, and now one year and a half old. The former measures 2 feet 3½ inches, the latter 2 feet 1½ inch in length, from the tip of the bill to the end of the tail. In spring, when they were in good condition, the drake weighed 5½ lbs., the duck 5¼ lbs. During the winter season, I gave them inferior food. In February, I began to feed highly, as the ducks will lay towards the end of that month, if the season be mild. I have been careful to select always the largest and handsomest birds of both sexes for breeding from. The result has been an increase, in three years, of 1 lb. on the average weight of my stock, which is now considered unequalled in this part of the country, both for appearance and weight.—*Digamma, Durham.*——The information of late respecting the breed and management of ducks has been acceptable to myself and other readers, who have an opportunity of uniting an attention to such matters with a love of gardening. Perhaps some of your correspondents will be kind enough to inform us also which is the best breed of fowls, and where they may be obtained. The Dorking is recommended by some for size and appearance upon the table; but I consider them lazy layers and bad mothers. Others recommend the Blue Game; but the pugnacious nature of these, even when very young, is much against them.—*J.B.K.L.*

To destroy Worms.—I have found lime-water, although made as strong as possible, of little or no value in destroying worm-casts on lawns. My gardener, however, took some water, in which wood-ashes had been thrown and some bells washed by a bellhanger, with which he watered a small piece of the lawn; this destroyed the worms in vast numbers.—*R.S.V.P.*

Mildness of Climate.—The frost in October having cut off the Dahlias, Pelargoniums, Heliotropes, and similar plants which were growing in my flower-garden, I must confess I was on the 22d ult. surprised on visiting the Sandrock Hotel, Niton, to find the undernamed plants in full bloom. The distance from hence is only 10 miles: Tropæ'olum Shillíngii, Pelargóniums, Salvia rubescens, Mignonette, Godétia bifrons, Fúchsia microphylla, F. coccínea, Single Anemone, Antirrhinums, Daphne collina, Chrysanthemums, Senécio Jacobæa, Polyanthuses, Common Primrose, Heliotropes, Gílias, Hepáticas, Coreopsis tinctoria, Double Violets, Oxyúra chrysanthemoides, and Nemophila insignis.—*A Subscriber from the First, Newport, Isle of Wight.*

FOREIGN CORRESPONDENCE.

Paris, Nov. 1842.—Many of your readers have no doubt heard of "Pêches de Montreuil, Figues d'Argenteuil, Abricots de Triel, and Raisins de Fontainebleau," but perhaps few have ever visited these places, and as I have frequently been asked why they are so celebrated, the following information may be interesting. It is, I believe, generally known that French gardeners delight in "specialities," when they find any kind of culture particularly lucrative, or when the soil and air of one place is more congenial than another, that they almost invariably abandon a general trade or unfavourable situation, and direct all their energies to that one favourite object. Not only is this the case with fruit, but equally so with flowers and plants; but for the present I will revert only to fruit. Montreuil-aux-Pêches is about four miles east of Paris, and, together with the adjoining village of Bagnolet, has long been renowned for its Peaches and Nectarines; so much so, that Paris and the country for 50 miles round is almost entirely supplied from these two places. It is, in fact, their staple article of trade, and one by no means inconsiderable, if report speaks truly of the amount, which is stated to be on the average 80,000 francs a year, independent of other fruits. An exact estimate of a produce so entirely regulated by the state of the weather is, I think, very difficult to ascertain. The year 1841 was unproductive, and the long continuance of wet and cold also materially checked the consumption: this season, on the contrary, has been exceedingly prolific, and the excessively hot weather in August augmented the demand in an equal ratio, and it is said that the sale this season realised more than 120,000 francs. Large as this sum may at first sight appear, it will not upon reflection be found exaggerated, when the number and extent of gardens is taken into consideration: the markets and streets of Paris were literally glutted at the end of July; and in August fine fruit was sold at one penny, and very good at a halfpenny each. The gardens vary in size from one-half to a whole acre, and are surrounded with walls about 8 ft. high, rising amphitheatrically one above another to the top of the hills; they give the neighbourhood a picturesque appearance. The soil is generally a deep sandy loam, with here and there a mixture of blue clay, similar to that of Montmartre and Père la Chaise. Most of the trees are old, yet their general appearance is healthy, which the cultivators attribute as much to their being worked upon Almond stocks as to the suitability of the soil. Fan-shaped training is usually adopted; but another form called "Espalier carré," is now coming into vogue. M. Lepère, of Montreuil, claims to be the originator of this system, which, however, is warmly disputed by some others. It appears to me to be little, if at all, different from the horizontal training which has for many years been practised in England. As the design of these gardens is profit, it may readily be supposed that the varieties are chiefly confined to those which are most prolific, or produce the finest fruit in their different seasons of maturity. At almost every cultivator's I found the Petite and Grosse Mignonne, Chevreuse hâtive, Galande, Magdeleine, Bourdine, Admirable, Belle de Paris, Royale, Pavie, and Têton de Venus, with a few Nectarines, such as Violette hâtive, Musqué, and Grosse Violette. The other parts of the walls are clothed with Cherries, Plums, and Pears. Strange as it may seem, I could not find any one who grew the Morello Cherry; and although I have often asked for it in Paris and other cities of France, I have never yet been able to meet with this delicious variety. The Cherry used here for preserves and brandy is somewhat of the same form, but far inferior in size, and totally deficient in the racy, vinous flavour so peculiar to the Morello. Among the Plums, I found Royale de Tours, Monsieur, Reine Claude, Mirabelle, and Reine Claude Violette most prized amongst the older sorts: Coe's Golden Drop is also becoming known, and is in much request. Triel is a small town, north-west of Paris, between St. Germain and Poissy; it enjoys an equal reputation for Apricots. The soil is here light and sandy, and the gardens are walled and terraced, in the same manner as those at Bagnolet and Montreuil; but the culture is not upon the same extensive scale. The training and pruning do not, as far as I could learn, differ in any way from those in general practice. The fruit is entirely sold to the Parisians, and is valued, on the average, at about 40,000 francs a year. The only varieties in cultivation are Précoce, Musch, Abricot Pêche, and Breda, on the walls, and Précoce and Abricot Pêche on standards. This last is of first-rate excellence, and succeeds admirably in the open ground; it is of large size and fine flavour, very like the Moor Park, if it is not, indeed, the same. The Mirabelle Plum is also very extensively grown in both these places, and for preserves it is preferred before any other variety. I have not often seen it thus used in England, and may, therefore, be excused for calling attention to its merits. When perfectly ripe, it is of a beautiful transparent, wax-like, golden colour, with a flavour something between the Apricot and Date. It is excellent preserved in brandy, to which it imparts a peculiar softness and delicacy, far superior (as I think) to that of Cherries; it also keeps its colour for a considerable length of time. But this is not all: its greatest attraction is when it has become one among the favoured coterie denominated Glacé: there it challenges equality, if not superiority, to the Apricot, Reine Claude, Pastéque Chinois, or even the Pine-apple itself.

PROCEEDINGS OF SOCIETIES.

MICROSCOPICAL SOCIETY.

Dec. 21.—Prof. Lindley, President, in the chair. A letter was read from the Rev. J. B. Reade on the existence of Ammonia in gum, sugar, and other "non-azotised bodies." The object of the author was to show that ammonia does exist in many substances in which chemists have failed to detect it, and that the microscope affords the means of demonstrating its presence. "By burning the substance in the spirit-lamp until flame and aqueous vapour have ceased, and receiving the gas during subsequent combustion upon a slip of glass, moistened with hydrochloric acid," Mr. Reade conceived, that by these means, so minute a portion as $\frac{1}{1000000}$ part of a grain of nitrogen, if existing as a constituent of ammonia, may be detected with certainty. In this way he stated that he had ascertained its presence in sugar, gum, beer, and suet, all bodies asserted by Liebig to be destitute of nitrogen. In a letter read at the previous meeting, Mr. Reade had also asserted that ammonia exists abundantly in human breath. Various specimens of what the author regarded as ammonia, preserved on slips of glass, were produced. Several of the members present proceeded to discuss the observations made by Mr. Reade, and in all cases opinion was unfavourable to their accuracy. Mr. Edward Solly observed that, supposing that Mr. Reade had really obtained ammonia from sugar, there still was no proof that the sugar employed was pure. A very minute quantity of impurity would account for the appearances seen by the author. But the paper did not in fact contain a single proof that ammonia had been found at all. As to its having been obtained from the human breath, that was no proof that ammonia was found in the lungs; it probably existed in the air. Dr. Lankester remarked, that no proof was offered that the matter found by Mr. Reade, and by him called ammonia, was ammonia at all. How does the author distinguish it in its miscroscopical state from other substances? It may have been common salt that was found. Hydrochloric acid, employed for fixing the supposed ammonia, is seldom pure, and holds many salts dissolved in it, (Mr. Bowerbank afterwards stated, on the part of Mr. R., that the acid was pure). There was no evidence that the researches had been made with due precaution. Mr. Warrington observed that Mr. Reade's experiments were at variance with those of Mr. Dell, as detailed in the Annals of Chemistry, when it was chemically proved that the ammonia, which appears to proceed from sugar, is derived from the nitrogen of the atmosphere. Even if it were in sugar it would be driven off by heat, and consequently could not be obtained by Mr. Reade's process. No doubt the ammonia found by the author—if, indeed, he really had obtained that substance, of which there was no evidence, was derived from the combustion of the matter examined in contact with the nitrogen of the atmosphere. With regard to ammonia in the breath, he (Mr. Warrington) had investigated that supposed fact. By breathing into a tube several times bent, a very considerable quantity of vapour may be readily condensed; but all tests fail to show even the slightest trace of ammonia under such circumstances. Mr. White then read an account of a new species of Xanthidium, and Mr. Hassall produced some further observations on the action of Fungi in producing the decay of fruit. These observations were met by experiments made by Dr. Lankester, who considered them unfavourable to Mr. Hassall's views. As both gentlemen undertook to produce further evidence at the next meeting of the Society, we reserve an account of their statements till that time.

BOTANICAL SOCIETY OF LONDON.

November 18.—A. Gerard, Esq. in the chair. Various donations to the library and herbarium were announced. A paper was read from G. Clark, Esq., of the Island of Mahe, "On the Lodoicea Sechellarum." The Lodoicea of Sechelles is an intertropical plant, peculiar to the Sechelles Archipelago, where it grows naturally in two islands only—Praslin and Curiense. Praslin lies to the north-east of Mahé, distant 21 miles; Curiense is to the north of Praslin, and is much smaller; a deep arm of the sea, from one to two miles in breadth, separates the two islands. They lie between 4° 15′ and 4° 21′ S. lat. and 55° 39′ and 55° 47′ E. long. In the other islands of this archipelago there are only a few Lodoiceas, which have all been planted, and only two or three appear to thrive. The trunk or stem of the Lodoicea is straight, and runs to the height of 80 or 90 feet, terminated by a splendid crown of winged palmated leaves; it is only from 10 to 15 inches in diameter, and so flexible that it waves to the slightest breeze. When the wind is moderately strong, the huge leaves of this giant Palm are clashed together with an astonishing noise. The outside of the stem is very hard and compact; but the interior is soft and fibrous. The leaves, which are winged and palmated, open like a fan, and in the early growth are more than 15 feet long, without the footstalk, which is at least as much more. In the mature trees the leafstalk is not more than 8 or 10 feet long, and the whole leaf does not exceed 20 feet in length, by 10 or 12 in breadth, being entirely destitute of thorns. The nascent leaves are enveloped, till the period of their expansion, in a thick covering of cottony down, of a nankeen colour; but this is occasionally wanting. The unanimous testimony of the inhabitants of Praslin proves that each tree produces only one leaf a year; and as three leaves occupy about eight inches of the trunk, and 20 years expire before that appears above the surface, a tree of 80 feet in height must be about 400 years old. The flowers, about 20 in number, succeed each other; one, or occasionally two, at a time. The nuts are two-lobed, and sometimes two nuts are enclosed in one husk. Three-lobed nuts are very rare, but some are met with; and it is said that specimens with five lobes have been found. The form of the nut is very singular, and cannot be compared to that of any other production of the vegetable kingdom. Two highly-remarkable circumstances in the history of the Lodoicea are, the duration of its blossoms, and the period necessary for maturing its fruits; for the latter seven or eight years are required. The Lodoicea grows in every variety of soil, but delights most in the vegetable mould of the deep gorges of the mountains. It is, nevertheless, found on bare mountain-tops, and forms a conspicuous and remarkable object in such situations. It is curious that the vegetation of the nut is prevented by burying it; but if suffered simply to rest on the earth, in a situation not too much exposed to the sun, germination readily takes place. The fruit, in its unripe state, is an agreeable and refreshing aliment: when ripe, it yields oil. Its germ furnishes a very sweet food. The entire nut is an article of commerce with India, where one of its uses is as an astringent medicine. The trunk is employed in building. The leaf forms a covering for roofs, nearly as good as shingles, besides furnishing materials of a very superior description for hats, bonnets, work-baskets, and artificial flowers, in the manufacture of which many of the Sechelloises display great taste and skill.

November 29.—Sixth anniversary meeting; J. E. Gray, Esq., F.R.S., President, in the chair. From the report of the council it appeared that 13 members had been elected since the last anniversary meeting, and that the society consisted of 152 members. The donations to the library, herbarium, and museum had been considerable, and the plants sent to the members (in return for their contributions) had given the greatest satisfaction; in many instances the parcel had been sent within 10 days after the receipt of the specimens, and it was anticipated that, in future, members would always receive their parcels within 10 days after the receipt of their contributions. Among the rarer plants received were numerous Scotch species, from Mr. H. C. Watson; a large collection of Shropshire Rubi from Mr. Bidwell; numerous species of Jersey plants, from Mr. Thwaites; 300 specimens of Bupleurum falcatum, collected in Essex, from Mr. Doubleday; and numerous specimens of Lastræa cristata, collected in Norfolk by Mr. Wardale. It was anticipated that the foreign collection (which includes plants from North and South America, New South Wales, Cape of Good Hope, China, British Guiana, and various other parts of the world) would soon be in reference order. A ballot for the council for the ensuing year afterwards took place, when the chairman was re-elected president, and H. C. Watson, Esq., F.L.S., and J. G. Children, Esq., F.R.S., were nominated vice-presidents. Additional local secretaries were also appointed.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Dec. 1.—The general winter meeting was held in the new Hall, in the Experimental Garden, Inverleith, the Hon. Lord Murray, V. P., in the chair. A large collection of Jersey Pears, sent by Mr. René Langelier, of St. Helier, occupied one table. On others were displayed, intermixed with Chrysanthemums, specimens of fine Pears and Apples, from different parts of Scotland, with Pine-apples, Grapes, Medlars, and retarded Currants, besides various culinary articles, such as Celery, Hamburgh Parsley roots, forced Seakale, Melongena, &c. Several communications which were read excited much interest. The first was a description, by Mr. Alex. Temple, of a "safety flower-pot," intended to preserve the roots of Pine-apples from being scorched when the pots are plunged in a hotbed in a state of strong fermentation. A model was exhibited; it has a hollow chamber below, and three lateral tubes to permit the escape of heat and vapour. The next paper was by Mr. W. Sharpe; it gave an account of the advantageous employment of fresh tree-leaves, succulent stems of herbaceous plants, &c. as manure, for various crops, upon a stiff clay soil. Then followed a report, by Mr. J. Dawson, of the successful raising of carrots for 14 successive years on the same piece of ground, where no crop of Carrots could previously be procured. The plot was described as extending to 45 feet by 13; the soil a heavy loam; in autumn 1828 it was trenched, and four cart-loads of sandy and surface heath-soil mixed with it; afterwards two barrow-loads of soot, two or three barrow-loads of wood-ashes, and four barrow-loads of pigeon-house cleanings, were dug in, and the ground was left rough till March, when the Carrot-seed was sown. The soot, wood-ashes, and pigeon-dung were repeated yearly, but the peat-soil was only once applied. Altringham Carrots from this plot of ground were exhibited, of large size and quite clean. The silver medal was voted for this communication. The premiums offered for the best two bunches of retarded Grapes, exclusive of Muscats, were awarded, 1, to Mr. P. Crockett, gr. to Col. Ferguson, for Black Frontignan and Raisin Grapes; 2, to Mr. Jas. Dodds, gr. to the Earl of Mansfield, for Black Damascus and Black Hamburgh. For the best two bunches of Muscat of Alexandria, to Mr. J. Young, gr. to Mrs. Ferguson. For the best Pine-apple, the silver medal was awarded to Mr. J. Robertson, gr. to Lord Gray, for a Black Jamaica; and the bronze medal to Mr. J. Macnaughton, gr. to J. Wauchope, Esq., for a variety of the Queen. For the best six sorts of dessert Pears, exclusive of Marie Louise and Crassane, three awards were made: 1, to Mr. J. Addison, gr. to the Earl of Wemyss: 2, Mr. Young; and 3, Mr. W. Thom, gr. to Capt. M. Innes. Best six Marie Louise Pears, Mr. P. Lockhart, gr. to G. Hope, Esq. Best six Crassanes, 1, Mr. Addison; 2, Mr. J. Murray, gr. to A. Fletcher, Esq. Ribstone Pippins, 1, Mr. C. Mackintosh, gr. to J. Tod, Esq.; 2, Mr. D. Brewster, gr. to Col. Lindsay; 3, Mr. W. Sharpe, gr. to Sir J. S. Richardson, Bart. Best six kinds of Apples, exclusive of Ribstones, 1, Mr. Young; 2, Mr. Thom. Best six stalks of solid Celery, three red and three white: 1, Mr. Jas. Goodall, sen., gr. to the Marquiss of Lothian; 2, Mr. J. Goodall, jun., gr. to L. Buchan, Esq.; 3, Mr. P. Thomson, gr. to J. J. H. Vere, Esq. For the best Tomatoes, the kinds being chiefly the large and small red, 1, Mr. Robertson; 2, Mr. Mackintosh. Spring-sown Onions, Mr. W. Finlay, gr. to the Hon. Mrs. Cochran. Numerous extra articles were also exhibited; amongst which were—a collection of Pears, sent by Mr. G. Shiells, gr. to Lord Blantyre; specimens of some of the finest French and Flemish Pears from dwarf standard trees in Luffness garden; a collection of dessert Pears, from Mr. Dunbar; a tray of the Ganges Apple, of large size, from Miss Henderson; another filled with fine specimens of the Yorkshire Greening, from Lord Mackenzie's garden: and a third, with a great variety of dessert Apples, from W. Dennistoun, Esq. Baskets of Scotch Medlars, from Pitfour, and of retarded Currants, from Saltoun, attracted much notice. The tables were decorated with Chrysanthemums, from the gardens of Mr. Oliver and Mrs. Ferguson; and with a beautiful specimen of Epiphyllum truncatum élegans, from the Inverleith Nurseries of Messrs. J. Dickson and Sons. The only extra culinary articles consisted of large specimens of the roots of Hamburgh Parsley, much used on the Continent, sent by Mr. G. Annand, gr. to Lord Murray; and of a dish of forced Seakale, from Lord Mackenzie's garden. The secretary stated that Messrs. Lawson having offered a premium of two guineas for the best herbarium of indigenous phænogamous plants and Ferns, formed during the season 1842, by a journeyman gardener, two collections had been been sent in competition, one marked Linnæa and the other Aspirans; that, after a careful inspection, the premium was found due for the one marked Linnæa, formed by Mr. C. Galloway, at Balcarres, and the other by Mr. H. Wilson, at Melville, to whom the silver medal was awarded. These awards were confirmed and sanctioned by the general meeting. The following new members were enrolled:—Hon. Mrs. A. Cochrane; Sir T. B. Hepburn, Bart., M.P.; Right Hon. D. M'Neill; Maj.-Gen. Sir N. Douglas, K.C.B.; A. Anderson, Esq.; P. Robertson, Esq.; S. Campbell, Esq.; J. M. Hog, Esq.; W. Wallace, Esq.; J. Bennet, Esq., W.S.; J. Hamilton, Esq.; W. Penney, Esq.; A. Park, Esq.; J. Ireland, Esq.; W. Moodie, Esq.; W. Hutchison, Esq.; W. Meikleham, Esq.; and J. M. Wood, Esq. The election of office-bearers for 1843 afterwards took place. His Grace the Duke of Buccleugh was re-elected President; D. Anderson, Esq., Vice-President; Sir H. Jardine and Sir T. B. Hepburn, Bart., M.P., were chosen of the Council. D. Mackellar, Esq., and H. D. Hill, Esq., were elected members of the garden committee; and E. Henderson, Esq., Mr. Goodall, and Mr. Thomson, of the committee of prizes. The other office-bearers were re-elected; Dr. Neill, secretary (for the 32d time); Mr. Ivory, Treasurer; Mr. Jas. Macnab, curator of the garden; and Mr. W. Evans, clerk.

BOTANICAL SOCIETY OF EDINBURGH.

Dec. 7.—Prof. Christison in the chair. The election of office-bearers for the season took place: Dr. Neill, President; Profrs. Christison, Graham, Balfour, and D. Stewart, Esq., Vice-presidents. Various parcels of plants were announced, also donations to the library from Dr. Müllar, Dr. Maly, &c. Prof. Christison submitted a highly interesting communication on the Assam Tea Plant, illustrated by specimens. The author stated that the different kinds of tea were produced by different modes of preparation,—and showed, by a series of examples of the preserved Tea leaf, that the various forms were merely varieties of the same plant. A specimen of tea, of a yellow colour, and of a remarkably strong flavour, was exhibited; also tea, in the form of small rolls, sent to this country about twenty years ago, as a present from the emperor of China to George IV. Mr. Goodsir then read a paper by C. C. Babington, Esq., F.L.S., entitled "Observations upon a few plants, concerning the claim of which to be considered as natives of Great Britain, Sir W. J. Hooker expresses doubt in the 5th Ed. of his British Flora, with a few notes upon other species contained in that work, with reference to the Edinburgh Catalogue of British plants." The object of this paper was to show upon what evidence the authors (Prof. Balfour, Mr. Babington himself, and Dr. Campbell), of the Botanical Society's Catalogue of British Plants, had included in it the species concerning which Sir W. J. Hooker expresses doubt. "I cannot allow this opportunity to pass," says the author of this paper, "without expressing the great satisfaction which it gives me to see that so distinguished a botanist as Hooker has considered the catalogue deserving of quotation *throughout his work*, as I must consider it as a proof that the compilers of the Catalogue of British Plants have not produced a work discreditable either to themselves or to the Society that entrusted its preparation to them. Mr. Brand afterwards read a "notice of the presence of Iodine in some plants growing near the sea," by G. Dickie. The author found, by chemical examination of specimens of Státice arméria, from the sea-shore, and of others from the inland and higher districts of Aberdeenshire—that the former contained Iodine, and that soda was more abundant in them, while potass prevailed in the latter. Iodine was also found in Grímmia marítima; and Mr. P. Grant, of Aberdeen, has found it in Pyrethrum maritimum. An analysis was made of samples of Státice arméria, Grímmia marítima, Lichina confinis, and Ramalina scopulorum, all growing near the same spot, and occasionally during storms exposed to the sea spray; all these plants, with the exception of the lichen, contained Iodine. The specimens having been washed previous to analysis, the Iodine could not have been derived from saline incrustation. All these vegetables were healthy, and the author of the paper has been led to conclude that marine algæ are not the only plants which possess the power of separating from sea-water the compounds of Iodine, and of condensing them in their tissues, and this without any detriment to their healthy functions.

BIRMINGHAM HORTICULTURAL SOCIETY.

Dec. 7.—The annual general meeting of subscribers was held at the Waterloo Rooms, the Earl of Dartmouth in the chair. The following report for the past year was read. "The Committee, in presenting a statement of their proceedings during the past year, cannot but congratulate the members of the Society on the flourishing state of the Garden; on the high rank which it continues to hold among similar establishments; and on the interest which its extensive and increasing collection of plants excites among the distinguished botanists of the day, many of whom have visited the Garden during the present year. Mr. Cameron reports that 'the trees and shrubs continue to grow satisfactorily, and have so far increased in size as to admit of the removal of a great number of Laurels, Spruces, Poplars, Willows, &c., which have been planted to fill up the spaces between the specimen-plants during their early growth.' The fruit-trees during the past season have further proved the superiority of the kinds recommended in last year's report as appearing to be the best varieties for this neighbourhood. Some few Apple-trees nearly perished last spring; their roots, it is supposed, having been injured by the long-continued wet weather of the previous winter. The collection of plants has been kept up and increased by the receipt of plants and seeds from nearly the same public establishments, nurserymen, and private individuals, as in former years: and the usual returns in plants, &c. have been sent from the gardens. During last spring, allotments of seeds and Dahlia roots were distributed from the gardens to all shareholders who applied for them. A larger assortment of seeds than usual will be again ready for distribution by the 1st of January next, and the shareholders are invited to apply for them at the gardens after that time. The only improvements made have been in planting a collection of Roses near the entrance; in increasing the number upon the lawn; and in keeping the grounds in better order, by a small increase in the number of hands. The exhibitions have been well supported by gentlemen with specimens of plants, fruits, and vegetables; while the cottagers' stand has usually presented a good display, and excited considerable interest. It is to be regretted, however, that the exhibitions have been attended with a loss to the funds of 55*l*. 10*s*. The promenades have also been unusually well attended, which may be attributed partly to the fineness of the season, and partly to the additional privileges granted to the shareholders and subscribers when the increased subscription came into operation. With regard to the finances of the Society, the committee beg to refer to the balance sheet prepared by the treasurer, by which it will appear that the funds present a more favourable appearance than at the last annual meeting."—*Birmingham Advertiser*.

COUNTRY SHOWS.

Norwich Horticultural Society, Nov. 23.—This, the sixth exhibition for the season, was better attended than has been the case for several years past. The following is a list of the Members Prizes: FLOWERS—BEST 25 CHRYSANTHEMUMS—Cluster Blush, King of Whites, Queen, Starry Purple, Unique, Goliath, Perspicuum, Conqueror, Tasselled Lilac, Duc de Caneglianо, Vesta, Superb Yellow, Eclipse, Marie, Tasselled Yellow, Elegans, Minerva, Cleopatra, Wheelerianum, Expanded Pink, Defiance, Colonel Combes, Insigne, Conspicuum, Incurved White, Rev. J. Burroughes; 2, Mrs. Burroughes; 3, W. Rippingale, gr. to G. Morse, Esq. BEST 20 DO.—Invincible, Starry Purple, Vesta, Unique, King of Whites, Quilled Pink, King, Queen, Tasselled Lilac, Clustered Yellow, Eclipse, Lucidum, Minerva, Coronet, Colonel Combes, Victory, Marie, Incurved Blush, Elegans, Defiance—Rev. J. Burroughes; 2, Rev. J. Burroughes; 3, W. Rippingale. BEST 15 DO.—Perspicuum, Unique, Starry Purple, King, Vesta, Campestroni, Superb Yellow, Gem, Sultana, Insigne, Defiance, Princess Marie, Marie, Conspicuum—Rev. J. Burroughes; 2, W. Rippingale; 3, Mrs. Burroughes. SINGLE SPECIMEN (Vesta), Mrs. Burroughes. PLANTS, Cactus truncatus and Gesnera elongata, Mrs. Burroughes; Primula sinensis, R. Spence, gr. to Sir W. B. Proctor, Bart. CUT FLOWERS, J. N. Waite, jun., Esq. SALVIA SPLENDENS, W. Rippingale. FRUITS: PINE-APPLE, D. Waters, gr. to Lord Wodehouse. BEST GRAPES, (Black Hamburgh), W. Rippingale, gr. to G. Morse, Esq.; 2, (Muscat of Alexandria), C. Aldborough, gr. to G. S. Kett, Esq.; 3, Mrs. Burroughes; 4, W. Scarlett, gr. to Mrs. Kett. OUT-DOOR GRAPES (Muscadine), R. Spence; 2 (Sweetwater), H. S. Patteson, Esq.; 3 (Muscadine), Rev. J. Burroughes. DESSERT APPLES, J. Cockburn, gr. to J. T. Mott, Esq.; 2, P. Jacobs, gr. to J. Scott, Esq.; 3, J. Gordon, Esq. COLLECTION OF APPLES, E. Kemp, gr. to J. S. Muskett, Esq.; 2, J. Gordon, Esq., SAUCE APPLES, E. Kemp; 2, S. Short, gr. to J. Stracey, Esq.; 3, Mrs. Burroughes. DITTO, W. Gale, gr. to H. N. Burroughes, Esq., M.P.; and W. Scarlett. DESSERT PEARS, W. Gale; 2, D. Waters; 3, W. Kemp, gr. to Sir E. Stracey, Bart. DITTO, J. Cockburn. BAKING PEAR, S. Short; 2, W. Rippingale. PLUMS (Imperatrice), S. Short; 2, Mrs. Burroughes. MEDLARS (Nottingham), Rev. J. Burroughes. DITTO, Mrs. Burroughes. WHITE CURRANTS, S. Short. CRANBERRIES, S. Short. WALNUTS, W. Gale; 2, W. Rippingale. COLLECTION OF PEARS, Mr. J. Wighton, gr. to Lord Stafford. SCARLET NONPAREIL APPLE, R. Bellman, Esq. VEGETABLES: CELERY, S. Short; 2, E. Kemp. CARROTS (Orange), S. Short; 2, S. Harper, gr. to J. Culley, Esq. PARSNEPS, Rev. J. Burroughes; 2, H. S. Patteson, Esq. LETTUCES, W. Gale; 2, Mrs. Burroughes. ENDIVE, P. Jacobs. PEAS, W. Gale. COLLECTION OF POTATOES, R. N. Bacon, Esq.; 2, S. Short. BRUSSELS SPROUTS, S. Short. BEET, R. N. Bacon, Esq.; 2, W. Gale. RED CABBAGE, W. Kemp. SEA-KALE, S. Short. HORSE-RADISH, T. Potter. CAULIFLOWERS, W. Kemp. CAPE BROCCOLI, Mrs. Burroughes. SAVOYS, S. Short; 2, P. Jacobs. SALAD, W. Gale, 2, S. Short. ASPARAGUS, W. Gale. TOMATOES, S. Short. CUCUMBERS, D. Waters. SEEDLING POTATOES, Rev. J. Burroughes. MUSHROOMS, R. Spence. Prizes to the amount of 10*l*. were also awarded to Cottagers.—*Norfolk Chronicle*.

Dumfries and Galloway Horticultural Society, Dec. 3.—The concluding meeting was held in the Court-house, Buccleuch-street. The large table was crowded with articles for competition, for which the following prizes were given:—*Baking Apples*: 1, Mr. O'Loughlin; 2, Mr. Colquhoun. In the dessert department of the same fruit, the 1st and 2d prizes were gained by Mr. Colquhoun. Two seedling Apples attracted much attention, and, when tried, were found of superior quality. These were sent by Mr. O'Loughlin. The *Pears* shown were remarkably large; the first prize was awarded to Mr. Craig. *Chrysanthemums*, Mr. Dickson. *Broccoli*, Mr. O'Loughlin. *Brussels Sprouts*, Mr. Fergusson. *Parsneps*, Mr. Fergusson. *Leeks*: 1, Mr. J. Learmont; 2, Mr. Fergusson. *Onions*, Mr. J. Learmont. *Spinach*, Mr. O'Loughlin; and for some specimens of *Knight's Early Cabbage*. A prize was also given for cut Herbaceous and Greenhouse flowers, reared by Mr Colquhoun, and for two plants in pots cultivated by Mr. O'Loughlin.

Roxburghshire Horticultural Society, Dec. 7.—This meeting was held in the Spread Eagle Inn Assembly-room, where prizes were awarded for the following articles:—APPLES *from Standards*, for table: 1, Mr. W. Ross; 2, Mr. D. Crichton, gr. to the Earl of Minto. APPLES *from a Wall*, for table: 1, Mr. W. Ross; 2, Mr. Weir, gr. to W. O. Rutherfurd, Esq. STANDARD PEARS, Mr. J. Crichton, gr. to R. Denniston, Esq. PEARS *from Wall-trees*: 1, Mr. J. Crichton; 2, Mr. T. Weir. KITCHEN APPLES: 1, Mr. G. Taylor, gr. to G. Broad, Esq.; 2, Mr. D. Crichton. CELERY: 1, Mr. J. Crichton, for Seymour's new Solid White; 2, Mr. T. Weir, for Solid Silver White. BRUSSELS SPROUTS: 1, Mr. D. Crichton; 2, Mr. G. Taylor. ONIONS: 1, Mr. J. Crichton, for James' Keeping and White Spanish; 2, Mr. G. Taylor, for Deptford and White Spanish. CARROTS: 1, Mr. A. Oliver, gr. to W. Fair, Esq.; 2, Mr T. Weir, for Long Orange.—*Kelso Mail*.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

ACA'CIA BIFLORA. Two-flowered Acacia. (*Greenhouse Shrub*). Leguminosæ. Polygámia Monœ'cia. This plant is neat, and tolerably compact in habit, growing to the height of from 18 inches to three feet. The leaves are small and sessile, having the flowers in their axils. The blossoms appear in pairs, and besides existing in the axils of the leaves, form a kind of spike at the extremity of the shoots. They are capitate, of a moderate size, and have a deep yellow or orange tint, with a pleasing fragrance. It should be potted in sandy loam and heath-mould, with the main roots a little elevated in the centre of the pot, and should be placed in an airy part of the greenhouse; by timely pruning, its stems should also be prevented from becoming long and bare. Cuttings taken from the tips of the shoots will form roots, though slowly, if treated in the ordinary manner.—*Paxton's Mag. of Botany*.

ECHITES SPLENDENS. Splendid-flowered Echites. (*Stove Climber*). Apocynáceæ. Pentándria Monogýnia.—Of the many handsome species of this genus which the late researches of botanists and travellers in Brazil have made known to us, this is unquestionably the most beautiful, and may vie with the choicest productions of Flora which have been of late years introduced into our gardens. It was received last year from the Organ Mountains by Messrs. Veitch, and has already produced copious and richly-coloured blossoms. The stems are climbing; the leaves in opposite and remote pairs, from six to eight inches in length. The flowers are produced in racemes of four or six together, and have a white tube, spreading upwards, with a flat limb four inches across, and of a beautiful rose colour, deepening towards the margin.—*Curtis's Bot. Mag.*

MACLEA'NIA ANGULATA.—Angle-flowered Macleania. (*Stove Shrub*). Ericáceæ. Decándria Monogýnia.—This plant flowered in June last in the stove at Woburn Abbey. It is an evergreen shrub of great beauty, and well deserves a place in every collection. The leaves on the young shoots are very delicate, and have a deep tinge of red. The flowers are nearly an inch long, red with a yellow limb, and are produced in threes from the axils of the leaves.—*Curtis's Bot. Mag.*

MISCELLANEOUS.

The Weather.—The newspapers are full of surprising circumstances connected with this mild season. More Violets can be gathered than in May. Birds are pairing and building, and all nature seems of opinion that spring has come. In some of the gardens near London, the flower-buds of the common Laurel are 3 inches long, the Mezéreums are covered with their white and purple flowers, the Rhododéndrons are trying to unfold, and Hyacinths are piercing the ground. At Edinburgh, in the garden of the Horticultural Society, the evergreen Rhododendron davúricum is reported to be in full blossom. In Yorkshire, Strawberries, Filberts, and even an Apple-tree (near Doncaster) are in bloom; and a correspondent at Colommendy, near Mold, in North Wales, mentions his having gathered some Mushrooms, one of which measured nearly 6 inches in diameter. We have similar communications from all parts of the country. If we should have such a January as that of 1838, which was preceded by just such weather as this, there will be a terrible return of killed and wounded in our gardens.

The French Method of Cooking Endive.—Endive is a delicious vegetable when it has undergone the culinary art, though in England it is scarcely ever used but in the form of a salad. The Endive, after being well picked and washed, must be parboiled in four different waters, to destroy the bitterness peculiar to it. It must then be boiled in salt and water till sufficiently done, when it should be thrown into cold water, squeezed, and chopped fine. It may afterwards be put into a stewpan upon a lump of butter, with a few young Onions, chopped very small, added to it. Let it dry; then dredge it with half a table-spoonful of flour, and add some good gravy, some seasoning, and two lumps of sugar; let it stew very gently a quarter of an hour; then serve it up alone or on sippets, or under sweetbreads, fricandeau, or mutton-chops.—*Muscipula.*

GARDEN MEMORANDA.

Hexton House, near Hitchin, Hertfordshire.—The mansion is a modern building, delightfully situated at the foot of a range of hills which extend through this county. The pleasure-grounds are in good keeping, and are ornamented with a beautiful serpentine piece of water. Here we noticed a plant of Thuya occidentalis, blown down some years since, the branches of which, having come in contact with the earth, have struck root, and at this time form a clump of young plants, nearly 40 yards in circumference, and from 15 to 20 feet high. We also saw a fine plant of Araucária brasiliensis turned out on the lawn during the summer months. At one end of the mansion is a small conservatory, containing some large specimens of the old kinds of greenhouse plants. A walk leading from the pleasure-grounds along the banks of the serpentine piece of water, brings the visitor to a small flower-garden, whence a view of a pretty waterfall is obtained through a vista of trees. In the kitchen-garden we saw some fine old Fig-trees, and the wall-trees are also very good. In the houses the Peach-trees and Vines are in excellent health; but the latter are, in our opinion, too heavily cropped. Mr. Chapman's Potato is here cultivated, *and spoken very highly of.* —*J. A.*

Bamford Hall, the seat of J. Fenton, Esq., near Rochdale.—The Pine-apple is cultivated here without bark in rather a novel manner. The pots containing the plants are placed in holes formed in a stage, and are heated by hot-water pipes passing beneath them. The plants are perfectly healthy, and seem to be quite in their element. The hothouses at this place are all nearly new, having been finished about two years since; they are glazed with sheet-glass, from two to four feet long, and have a very light appearance. We understand that Mr. Cherry, the head gardener, superintended their erection, which reflects great credit upon him. We hope that he will furnish us with a plan of his fruiting pine-stove, and with an account of his treatment of that plant, in your forthcoming pages.—*A. B., Manchester.*

Reviews.

A Catalogue of the Fruits cultivated in the Garden of the Horticultural Society of London. 3d Edition. 8vo.

THIS is in every way the most important work on hardy fruits which has yet been produced. It is a catalogue of all the sorts of Apples, Pears, Plums, Cherries, Vines, and other fruits existing in the Garden of the Horticultural Society, where everything of the kind has, for these 20 years past, been collecting from all parts of the world. Every statement made in it is the result of the personal observation of Mr. Thompson: not a single circumstance having been taken on trust from others; and thus it has an authority which it could not have secured if the compilation of it had been less surrounded by precautions. By throwing the matter into the form of tables, a book that would otherwise have formed a volume as thick as a dictionary is compressed into 180 pages, without any loss of information. But it is not merely for the sake of its accurate descriptions that this work has so much value; the identification of synonymes is most extensive and important. If in Natural History the multiplication of names is a great evil, the inconvenience is carried much further among the fruits in common cultivation, many of which have a considerable number of different appellations; for instance, the Borsdorffer Apple has 13 names, the Old Golden Pippin 16, the Golden Reinette 14, the Moorpark Apricot 10, the Bigarreau Cherry 14, the May Duke 22, the Grosse Mignonne Peach 40, the Black Hamburgh Grape 36, and the Black Cluster Grape as many as 46 different names. All this confusion is most carefully rectified in the work before us. In short, containing as it does all the certain knowledge that exists concerning the fruits of Great Britain, it is as indispensable to a gardener as a spade or a pruning-knife. We are glad to add that it is published at so low a price as to be within reach of a very poor man's pocket.

Mills' Treatise on the Cucumber. 2d Edition.

THE demand for a second edition of this work shows the opinion of the public as to its value. It has already been noticed in the earlier pages of the *Chronicle.* The present edition contains, in addition, a plan and section of the author's improved pit. Mr. Mills has likewise furnished a series of observations upon forcing Cucumbers during the earliest months of the year, as well as the treatment which they should each day receive. The regularity of the temperature during this period within the pit, at the time of its being uncovered, is an important fact; the thermometer generally standing above 70°. Even on the 4th of January, 1842, when the thermometer outside fell 10° below zero (qy. 10° below freezing ?), that within the pit indicated 64°. In addition to the descriptions given for cultivating the Cucumber and Melon, this work also comprises accurate details for forcing Asparagus and Seakale, two vegetables now considered, in every good garden, almost indispensable at this season of the year.

The Zoologist. (8vo. Van Voorst.)—UNDER this name has appeared the first Number of a monthly publication, intended as a journal of facts and anecdotes relating to all departments of the animal kingdom. As far as we can judge from a single number, it seems well supported by contributors, and likely to become a useful and entertaining miscellany.

Punch,—Punch's Almanac,—Punch's Pocket-book,—Punch's Letters to his Son, although not horticultural, are popular productions of too remarkable a character to be entirely passed by in a newspaper. There may be some grave people who think that we poor gardeners should mind our spades, and not relax our faces even into a grin at this merry season; we dare not hope that *they* will agree with us in our recommendation of the works of Mr. Punch. We, however, who think a good laugh a good thing, and who like the under-current of right feeling which pervades the pages of our worthy contemporary, cannot refrain from joining the public press in recommending him to the favour of such of our readers as do not yet know him. Mr. Punch, in the form he has now assumed, is the good fool of our forefathers, who hid many a wholesome truth beneath his gibes, and more wisdom under his cap and bells than could often be met with in those days beneath a cowl or a helmet. Punch's Almanack in particular is admirable; and its illustrations, as indeed they usually are in these publications, a most extraordinary advance in the artist-like execution of wood engraving. To those, however, who think a quarto an inconvenient dose of almanac, *Howlett's Victoria Golden Almanac,* about three inches long and two inches wide, printed with gold letter upon an azure ground, may be administered without any fear of the consequences.

CALENDAR OF OPERATIONS *for the ensuing week.*

IN accordance with the plan of the Proprietors—who, with a view of diffusing the greatest possible amount of practical information, have determined that the Weekly Calendar of Operations shall be contributed by a different person every year—our labours terminate this day. In our past contributions a critical observer could, no doubt, discover many omissions and some oversights (for all of which we are answerable, with the exception of the article "Stove," that part having been furnished by another hand); yet we trust that upon the whole the Calendar has been found useful, not only by young gardeners, but in some degree also by those who have had the advantage of longer experience. It will be admitted by all who possess any practical knowledge of horticulture, that there is scarcely any business, even among those that are designated the higher professions, which demands so much forethought—such unremitting mental exertion—as gardening on an extensive scale; it is, therefore, in no degree unconscionable that even the most experienced among us should sometimes need a remembrancer. The most perfect of these, however, could not be universally applicable, because the accidental circumstances of soil, situation, climate, the particular requirements of different families, &c., must necessarily modify any given rules; still some useful hint might be gathered from a Calendar, even by those to whom many of the directions in it may be unsuited. We can from experience bear testimony to the advantages derivable from the system recommended by Mr. Paxton—namely, that young gardeners should make a Calendar for themselves, by a daily record of observations and occurrences relating to their business. In addition, we would suggest that, to afford a ready reference, the date when any crop is sown should be written on the tally, with the name of the variety.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—The general management of the plants, as previously detailed, should be continued, avoiding, as much as possible, all unnecessary excitement through the dull months of winter. Give water only when actually necessary, and then very sparingly. When the heat of the bark-bed is low, let the water be a few degrees warmer; when high, a few degrees cooler. The linings of dung-heated pits ought to be often examined; heavy rains will check their fermentation as much as cold weather. Uncover the pits early on mild mornings, to give the plants the benefit of light, and for the same reason the glass should be kept as free from dirt as possible.

VINERY.—If the Vines subjected to artificial heat have been habituated to early excitement, the buds will most likely now be breaking; in which case, the night temperature should be increased two or three degrees, giving air as before on fine days, but not so freely as to incur a loss of much heat. A frequent admission of fresh air, except for the purpose of keeping the temperature within prescribed limits, is not essential to the health of the plants until the leaves are sufficiently developed to perform their functions. The Vines in the late houses should be kept cool by frequent exposure. To ripen Grapes about the end of May, a house should be shut up now. Late fruit must be carefully attended to in damp weather.

PEACH-HOUSE.—When the blossoms begin to open, discontinue the sprinkling of the trees, and in other ways keep the atmosphere drier. During the period of flowering some of the sashes should be opened every day, if possible. The temperature by fire-heat may range between 45° and 50°, according to the state of the weather.

CHERRY-HOUSE.—Prepare a house for forcing, if it is intended to commence early next month.

CUCUMBERS.—See that bearing plants are not over-cropped. If growing in pots or boxes, take care that they are judiciously watered; but if in pits, in a larger body of soil, they will seldom, if ever, require water at the roots now. Attend particularly to young plants in common frames; a little inattention will destroy them.

ASPARAGUS.—If a constant succession be required, a new bed should be planted every three or four weeks; but the intervening time must of course be regulated by the size of the frames, and the consumption.

SEAKALE and RHUBARB should also be brought forward for succession.

STRAWBERRIES.—Some pots may be put into the early Peach-house, or any other convenient place where the temperature does not exceed 50°.

Out-door Department.

ARTICHOKES.—Dress off some of the long outside leaves, and then mulch round the plants with rotten leaves, or anything else that will be serviceable in keeping off frost.

CAULIFLOWERS.—Any of these, and likewise of Broccoli, which are now fit for use, must be taken up and housed before frost.

CELERY.—In case of frost cover a few rows with fern or litter.

ENDIVE.—That which is covered for blanching by flower-pans must be protected from severe frost by dry litter or leaves.

HORSE-RADISH.—Dig up a quantity for winter use, and lay it in sand.

JERUSALEM ARTICHOKES.—If none of these have been taken up, it should now be done; mulch those that are left in the ground.

PARSNEPS, CARROTS, and other winter roots must not be permitted to grow. The sprouting of these and the sorting of Onions can be done on wet days.

ORCHARD.—Unprotected Fig-trees must be covered before severe frost sets in, as the continued mild weather will have made the young wood more than usually susceptible of injury by cold. Prune Orchard trees; at the same time heading down any that it is intended to graft. Prune and nail when the weather permits: on bad days look over the fruit in the fruit-room, from which frost must be strictly excluded.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Water-plants, such as Nymphæa, may be rested for a few weeks, which will make them flower more freely in the following year. When the plants are infested with red-spider, the pipes should be painted over with a mixture of sulphur. Continue to make preparation for shifting the plants. Gloxínias and Sinníngias which are beginning to grow should be repotted and watered; others of the same kind which are not growing may still be kept dry, to flower later.

GREENHOUSE AND CONSERVATORY.—Whatever the weather may be, a little air, if at all practicable, ought daily to be given to hard-wooded plants, as these always suffer from close confinement with fire-heat, which should therefore not be unnecessarily employed. Let the plants be kept free from dead leaves and other eye-sores, be neatly tied and trained, and the surface of the soil now and then stirred, to prevent the growth of Moss. At a season when there are few flowers to interest, especial attention should be paid to order and neatness, for a well-managed plant is always a pleasing object, whether in blossom or not.

PITS AND FRAMES.—When plants that are in bloom are removed from the forcing-pit, the bark-bed should be stirred before taking in a fresh set. Introduce a few Pinks to the early Peach-house, or any other convenient place where the temperature does not exceed 50°. Maintain a regular succession of Hyacinths and Narcissuses, which, besides being easily managed, are, on account of their odour, the most desirable bulbs for forcing. Use every precaution to prevent the plants in the cold pits from damping; they should be very sparingly watered, and exposed to the air at every suitable opportunity.

Out-door Department.

Unless alterations are in progress, there will be little to do in the flower-garden at this season of the year, except occasional cleanings and the manuring and digging of empty beds or rough flower-borders. On frosty mornings wheel out the soil from beds which it may be necessary to renew for Carnations or other florists' flowers; that taken out may be spread over the herbaceous borders with advantage to the plants. If not yet done, let coverings be prepared for tender shrubs, as a dangerous degree of cold sometimes occurs without much previous warning.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Young plants which are intended to remain in the seed-beds another summer should be thoroughly cleaned, and the weeds dug into the alleys. All work of this kind should be forwarded while the weather continues open, that it may not be a hindrance in the busy season of spring.

FOREST AND COPPICE-WOODS.—Coppice-wood may be cut. Proceed also with the thinning of young plantations, which ought to be done in moderation, and according to some premeditated system, not at hap-hazard. Planting should be continued, if not yet finished.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Dec. 29, 1842, as observed at the Horticultural Garden, Chiswick.

Dec.	Barometer.		Thermometer.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
Friday 23	29.614	29.551	46	31	38.5	S.W.	.09
Saturday 24	29.794	29.651	50	25	37.5	S.W.	
Sunday 25	29.815	29.659	50	48	49.0	S.W.	
Monday 26	29.548	29.141	51	41	46.0	S.W.	.20
Tuesday 27	29.661	29.321	47	25	36.0	W.	.01
Wednesday 28	30.144	29.929	43	27	35.0	W.	
Thursday 29	30.174	30.112	52	46	49.0	W.	
Average	29.821	29.623	48.4	34.7	41.5		.30

Dec. 23. Rain during the day; clear and fine at night.
24. Slight frost; clear and very fine with bright sun.
25. Frosty; slightly overcast and fine; boisterous at night.
26. Densely clouded and windy; rain at night.
27. Rain; cloudy and damp; clear and frosty at night.
28. Frosty; clear and fine; slight frost.
29. Overcast throughout.
Mean temperature of the week 4½° above the average.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending Jan. 7, 1843.

Jan.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
						N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

Sat. 7	38.6	28.1	34.3	3	0.13	1	3	3	2	2	3	2	1

The highest temperature during the above period occurred on the 6th, in 1839—thermometer 53°; and the lowest on the 7th, in 1841—thermometer 6°.

REPORT ON COVENT GARDEN MARKET,

For the Week ending Dec. 30, 1842.

[The Half-sieve contains . . . 3½ imperial gallons.
The Sieve . . . . 7 " "
The Bushel Sieve . . . . 10½ " "
The Bushel Basket . . . . . . 1 imperial bushel.
Punnets for Seakale are . . . 7¾ in. wide and 2 in. deep.
" Radishes . . . . . 8 " 2 "
" Mushrooms . . . . 7 " 2 "
" Salad . . . . . . 5 " 2 "]

IN consequence of the Christmas holidays, the supplies have been much smaller than usual during the past week; prices in most instances remain the same, and trade continues dull. *Fruit:* Pines have made a slight advance in price; amongst them are some handsome Montserrats. Hothouse Grapes have also risen to 5*s.* and 8*s.* per lb. A few Pomegranates still remain, which are selling at 4*s.* per dozen. Dessert Pears of different kinds are well supplied; the principal sorts are the Old Colmar and Glout Morceau, at 8*s.* per half-sieve; Nelis d'Hiver at 10*s.*; with the Beurré Rance and Passe Colmar at 6*s.* per half-sieve. The best dessert Apples are the Golden Pippin and Nonpareil, at 10*s.* per bushel; the Ribstone Pippin, at 6*s.* per bushel; and the Newtown Pippin, from 2*s.* to 3*s.* per dozen. A few Cucumbers have also been offered during the week, from 9*d.* to 1*s.* 3*d.* each. *Vegetables:* The supply of Asparagus continues to increase: the best bunches fetch from 7*s.* to 9*s.* each; the smallest not more than 2*s.* and 2*s.* 6*d.* Seakale is of good quality and tolerably plentiful, which has rendered it somewhat cheaper. A small quantity of French Beans have appeared, which fetch from 2*s.* to 3*s.* per 100. Cauliflowers are no longer to be procured, but excellent White Broccoli may be obtained in their place: this, on account of the limited supply in the early part of the week, rose from 1*s.* 6*d.* to 3*s.* per bunch, but it is doubtful whether this high price will continue. The demand for Rhubarb is very small, and its price has consequently fallen. Mushrooms are unusually cheap and abundant, good ones being procurable from 5*d.* to 9*d.* per punnet. *Flowers:* Amongst the cut flowers we observed Helichrysum proliferum, Cypripédium venustum, Grevílleas, Gesneras, Camellias, Hyacinths, Azáleas, Rhododendrons, Epacrises, Tulips, Narcissuses, Violets, &c.

PRICES, SATURDAY, Dec. 31, 1842.—FRUITS:—

Pine Apple, per lb. 4*s* to 6*s*
Grapes, Hothouse, per lb. 5*s* to 8*s*
— Spanish, 10*d* to 1*s*
— Portugal, 1*s* to 1*s* 6*d*
Apples, dessert, per bush., 2*s* 6*d* to 7*s*
— Kitchen, 2*s* to 6*s*
Pears, dessert, per hf. sieve, 2*s* to 8*s*
Cucumbers, per brace, 1*s* 6*d* to 2*s* 6*d*
Melon, Spanish, 2*s* 6*d* to 5*s*
Pomegranates, per doz., 4*s*
Oranges, per doz., 9*d* to 2*s*
— per 100, 4*s* to 14*s*
— bitter, per 100, 10*s* to 12*s*

Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Almonds, per peck, 6*s* to 7*s*
Sweet Almonds, per pound, 2*s* 6*d* to 3*s*
Chesnuts, per peck, 3*s* to 7*s*
Walnuts, per bush., 12*s* to 16*s*
Filberts, English, per 100 lbs. 60*s* to 65*s*
Cob Nuts, per 100lbs., 70*s* to 85*s*
Nuts, per bushel—
— Brazil, 16*s* to 20*s*
— Spanish, 18*s* to 20*s*
— Barcelona, 24*s*
— Cobbs, 14*s*

VEGETABLES.

Savoys, per doz. 6*d* to 1*s*
Cabbage, per doz. 6*d* to 1*s*
— plants, per doz. 1*s* 6*d* to 2*s*
— Red, for pickling, 1*s* 6*d* to 5*s*
Brussels Sprouts, per hf.-sv. 1*s* 3*d* to 2*s*
Broccoli, White, per bunch, 1*s* 6*d* to 3*s*
— Purple, 9*d* to 1*s*
Beans, Kidney, forced, per 100, 2*s* to 3*s*
Potatoes, per ton, 40*s* to 75*s*
— per cwt. 2*s* to 4*s*
— per bushel, 1*s* 3*d* to 2*s*
— Kidney, per bu., 1*s* 6*d* to 2*s* 6*d*
— New, per lb., 6*d* to 9*d*
Jerusalem Artichokes, per half-sieve, 9*d* to 1*s* 6*d*
Turnips, per doz. bun., 1*s* 6*d* to 2*s* 6*d*
Red Beet, per dozen, 9*d* to 1*s*
Scorzonera, per bundle, 1*s* 3*d* to 1*s* 6*d*
Salsafy, per bundle, 1*s* 3*d* to 1*s* 6*d*
Cardoons, each, 1*s* 6*d* to 2*s*
Horse Radish, per bundle, 1*s* 6*d* to 4*s* 6*d*
Radish, per doz. hands (24 to 30 each) 8*d* to 1*s*
— Turnip, p. doz. bch., 1*s* to 2*s* 6*d*
Carrots, per doz. bun., 3*s* to 5*s*

Parsneps, per dozen, 6*d* to 1*s*
Spinach, per sieve, 1*s* to 1*s* 6*d*
Leeks, per doz. bun., 1*s* 6*d* to 2*s*
Onions, per bushel, 4*s* to 6*s*
— Pickling, per hf.-sv., 3*s* to 4*s*
— Green, p. doz. bun. 3*s* to 4*s*
— Spanish, per doz. 2*s* to 4*s*
Garlic, per lb. 6*d* to 8*d*
Shallots, per lb., 1*s*
Asparagus, per 100, 7*s* to 9*s*
— Second, 2*s* 6*d* to 3*s* 6*d*
— Sprue or Small, 2*s* to 2*s* 6*d*
Sea-kale, per punnet, 1*s* to 2*s*
Lettuce, p. sc., 9*d* to 1*s*
Endive, per score, 9*d* to 1*s* 6*d*
Celery, p. bd., (12 to 15) 6*d* to 1*s* 6*d*
Rhubarb Stalks, per bdle, 1*s* to 1*s* 3*d*
Small Salads, per punnet, 2*d* to 3*d*
Watercress, per doz. sm. bun. 4*d* to 6*d*
Parsley, per dozen bunches, 1*s* 6*d* to 2*s*
Tarragon, per doz. bun., 2*s*
Sage, per doz. bunches, 1*s* 6*d* to 2*s*
Mint, per doz. bunches, 2*s*
Mushrooms, per pottle, 5*d* to 9*d*

Notices to Correspondents.

TO CORRESPONDENTS.—*J. G.—J. B. D.*—Many thanks. We hope to find room for you next week.

MANURES.—*A. Y.*—The weight of a pint of guano, strike measure, is about 1 lb.¶——*M.*—It is the opinion of physiologists that Silicate of potash is not formed during the progress of vegetation, but that the silex and alkali are united in the soil, and absorbed in a state of combination.†

SOILS.—*A. W.*—You hardly give us information enough to enable us to send you a good answer. In the first place, you say you have formed a heap of Peat-moss and farm-yard manure; but what is peat-moss? Is it peat? If so, it is a good material, and you cannot do better than employ it to absorb the contents of your cesspool; there is no reason to fear any iron it may contain. Is it moss? If so, it is useless until it is thoroughly rotted. Supposing your compost heap to be mellowed by remaining for 2 or 3 months after the contents of the drains have been added, there is no doubt that 25 tons an acre of it will bring you heavy crops of vegetables, and consequently of turnips. We will give you a list of sorts for espaliers, if you will say how many Apples, Pears, &c., you want.†

GARRYA ELLIPTICA.—*A. S.*—If you have any specimens of this which do not produce catkins, pray examine them carefully to see if they are not females. This plant has males on one plant and females on another; the former only have yet been seen alive; and yet there ought to be females in the country. The discovery of them would be most interesting. The males always produce catkins, so far as we have ever seen.†

RHODODENDRONS.—*C. M. K.*—The following Rhododendrons may be recommended as hardy and showy:—catawbiense, and its varieties, azaleoides, pónticum, and its varieties, ferrugineum, hirsutum, máximum, and its varieties, campanulatum, davúricum atrovirens, caucásicum, Lówii.—¶

CHIMAPHILAS.—*J. A.*—Some of the American writers on Materia Medica say that *C. maculata* is inert; others, however, regard it as probably similar in its action to *C. corymbosa*. The latter, however, is the one that is officinal in the United States.†

HARDY PLANTS.—*A Beginner* will find at p. 807, a list of good hardy herbaceous plants, with which he may decorate his new flower-garden. To these he may add some of the more common bulbous plants, such as Snowdrops, Crocuses, Lilies, Narcissuses, Jonquils, &c., if he can procure the bulbs so late in the season.‡

EVERGREENS.—*T. S. P.*—The sooner you plant your Hollies and other evergreens the better: this operation must, however, be done when the weather is open.‡

MISTLETOE.—*E. J. H.*—For an account of the manner in which the Mistletoe is propagated, we must refer you to p. 225 of the *Chronicle* for this year.‡

COUCH-GRASS.—*A Surrey Subscriber and Others.*—The only means of destroying Couch-Grass is to fork over the ground infested with it; all the underground stems or runners met with in this operation should be carefully collected and burned.‡

FAIRY RINGS.—*Early Subscriber.*—We know of no means of destroying fairy rings. It is not they which produce fungi, but fungi which produce them.†

WEEDS.—*T. H. S.*—You must favour us with the real name of the plant you call Chickweed, before we can advise you what to do in order to extirpate it. Chickweed is neither perennial nor parasitical, but a little annual (Stellaria media) and of no importance. We cannot guess who your enemy is.†

SINNINGIA.—*A Tyro.*—Plants of this genus require to be grown in a humid stove, and should be potted in sandy loam, enriched with leaf-mould. They should be freely syringed during their period of growth; but in winter they will only need occasional waterings to prevent the soil from becoming dry.‡

EPACRIS.—*A Tyro.*—This tribe, as well as Heaths, can always be kept bushy by nipping out the tips of the shoots; which plan is much preferable to pruning them with a knife.‡

FRANCISCEA.—*A Tyro.*—Both Franciscea Hopeana and F. latifólia are stove-plants, and will succeed well if potted in a mixture of fibrous heath-mould, sandy loam, and silver sand. They should be allowed plenty of pot-room, and a moist atmosphere, and should be grown near the glass: they will be benefited by a slight shading during bright sunshine in summer.‡

THE MYRTLE.—*J. S.*—The Common Myrtle is Myrtus communis. It will grow in any free soil where it is fully exposed to the light; but as it cannot bear much frost, it must be put into a greenhouse or be well matted and drained in winter. The berries were made into a sort of wine by the Romans. It is a totally different plant from the Candleberry Myrtle, which is not a Myrtle at all, but a sort of Gale.†

RUSSELIA.—*R. S.*, who has several plants of Russélia júncea trained upon wire trellises eight feet high, had better cut out only that portion of the old wood which does not appear likely to produce vigorous shoots. If the young wood is allowed to droop in front of the trellis, instead of being trained to it, the plant will have a much nicer appearance.‡

BRUGMANSIA.—*R. S.*—Brugmánsia sanguínea succeeds best when planted out in the border of a conservatory. It may, however, be made to flower freely in pots, if allowed plenty of room, and planted in light rich soil. No doubt the reason why your plants have not bloomed is owing to your having kept them in the stove, where the high temperature would induce them to make abundance of wood instead of producing flowers.‡

CLIMBERS.—*A Subscriber.*—The following are good stove climbers for growing in pots: Stephanotis follicularis; Thunbérgia Hawtayneana, two varieties, one white and the other blue; Manéttia cordifólia, and M. bícolor; Ipomœa rubro-cærúlea, I. scabra, and I. Horsfálliæ; Convólvulus pentanthus, and Pergulária odoratíssima. The best greenhouse climbers are Tropæolum trícolor, T. azúreum, and T. brachýceras; Zíchya villosa, Z. pannosa, and Z. trícolor; Gompholóbium versícolor; Kennédya Marryattæ; Hardenbérgia macrophylla, H. racemosa, and Sóllya heterophylla.‡

EVERLASTING ROSE.—*A Young Lady.*—This is also known as the Rose of Jericho, described at p. 363. It may be grown in England, and the most likely method of succeeding with it will be to treat it in the same manner as the Ice-plant.‡

CUTTINGS.—*A Constant Reader.*—We advise you to let your cuttings of Fuchsias, &c., remain in the pots in which they were struck, until February or March, when they may safely be potted off separately. Unless the young plants are well rooted, it would be dangerous to disturb them at present.‡

ROSES.—*A. B. C.*—If your plant is the true Rose de Lisle, we can only account for its not flowering by your stating that it is grown against a north aspect. It usually is an abundant bloomer.‡

PELARGONIUMS.—*A. E. C.*—We recommend you to discard from your collection Röseum elegans, Ivanhoe, Bridegroom, and Joan of Arc: and to add to it—Matilda, Leila, Garth's Witch, Cyrus, Grand Monarch, Queen of the Fairies, Gaines' Rising Sun, Erectum, Orange Boven, Madeleine, Hodges' Commodore, Rhoda. Your collection is a small but very good one; deficient only in variety of colour.*——*J. H.*—Your collection of Pelargóniums will be much improved by adding—Conservative, Gem of the West, Hodges' Commodore, Grand Monarch, Leila, Garth's Witch, Hodges' Emperor, Matilda, Gaines' Rising Sun, Madeleine, Queen of the Fairies, Pamplin's Anna, Prince of Waterloo, Rhoda. Your question relative to the Carnations will receive attention.*

BULBS.—*νμρινη.*—Gladiolus tristis and Hesperantha longiflora should be potted in sandy peat to which a small quantity of loam has been added. They should be kept in an airy part of the greenhouse, and allowed plenty of water after they have begun to grow. Brunsvígia falcata should be planted in rich light loam, with the neck just above ground. It requires abundance of water when growing in winter, but should be kept during summer in a dry part of the stove in a state of perfect rest. Nerine flexuosa and undulata should be encouraged to make a vigorous growth of leaves during the autumn, and these must be kept from injury by frost or drought during winter: in May, the plants may be allowed to rest; and, after remaining in that state for three months, their growth must be again promoted by watering. The treatment which Vallota purpúrea and Hæmanthus toxicárius require is given at p. 809. Cyrtanthus obliquus should be kept near the glass in a cool part of the stove; a light soil, not retentive of moisture, is best adapted to it; and during winter, water should be sparingly administered. Amaryllis longifólia will succeed very well planted by the side of a pond, just above the level of the water; so that the roots will at all times have plenty of water within their reach.‡——*Bulbosus* writes thus: "A bulb of Brunsvígia Josephinæ broke into leaf in August last, and has since matured about eight large leaves on each side, in a temperature averaging between 50° and 60°. It has been occasionally well watered, but rather under than over done in this respect. Within the last nine days the leaves have appeared to flag; the bulb itself, which is above the surface of the soil and naked, is softer than what it ought to be; and some slight appearance of decay exists in the outer coats, but not much." [It seems very probable that the bulb has been affected by the moisture of the atmosphere. This seems to be confirmed by the statement of Mr. Herbert, one of the most successful cultivators of this tribe of plants, who says, "that if the bulb is exposed, it imbibes moisture from the atmosphere in the season of rest, which becomes fatal to it; and that those plants, the necks of which had never been raised above ground, were always found in the safest state. They should be potted in rich light loam, and should be watered abundantly in winter; in summer, dry heat and perfect rest are necessary." In all cases, the rule is to give water while growing, and in proportion to the rate of growth, and to withhold it when not growing. A temperature of 50° is too low to grow this plant successfully.‡]

FRUIT-TREES.—*A. B. Z.*—As you have already planted Cherries for training in the umbrella form, and as you do not wish for either Apples or Pears, your choice becomes limited to Plums; but without great care neither Plums nor Cherries will succeed when trained downwards. Their tendency to send up strong shoots in a contrary direction will be incessant during the growing season; and if these are allowed to take the lead, the pendulous branches will become so weak, that they will not be capable of receiving the full supply of sap, and gumming will be the consequence. You can only hope to succeed by pinching strong shoots on their first appearance. The eleven Plum-trees which you require may consist of the following: 2 Royale Hâtive, 2 Green Gage, 2 Purple Gage, 2 Coe's Golden Drop, Washington, St. Martin's Quetsche, and Ickworth Imperatrice.‖——*Hibernicus.*—The varieties enumerated for a *Subscriber*, at p. 825, are suitable for your north aspect; the remaining space may be profitably filled with Red Currants, planted two feet apart, and trained with a single stem, in order that they may reach to the top of the wall. For your east aspect—*Plums:* 1 Royale Hâtive, 2 Green Gage, 2 Purple Gage, 1 Coe's Golden Drop, 1 Ickworth Imperatrice. *Cherries:* 2 Mayduke, 2 Elton, 2 Bigarreau, 1 Florence. For the west aspect—*Pears:* Marie Louise, Beurré Bosc, Hacon's Incomparable, Thompson's Suffolk Thorn, 2 Winter Nelis, 2 Glout Morçeau, Passe Colmar, Knight's Monarch, Easter Beurré, Ne Plus Meuris, 2 Beurré Rance. Riders may be planted with advantage, provided you remove them before either their roots or tops interfere with the permanent trees.‖——*M. W. K.*—Three good Pears for a south-west aspect, are the Passe Colmar, Glout Morçeau, and Beurré Rance. Three Plums for a south-east aspect may be the Royale Hâtive, Purple Gage, and Green Gage; or Coe's Golden Drop, if you already possess enough of the Green Gage.‖——*J. D.*—The Jargonelle Pear will take on the Quince-stock, and succeed for many years, although not so well as some others. The Pear-stock is preferable for this variety. We have seen so many varieties of Pears growing on the Quince, that we can scarcely believe there are any that will not take upon it, if properly worked; that is, as the French do them, close to the ground; care being likewise taken that the Quince-stocks intended for being grafted are cut down before vegetation commences. If a variety of Pear should greatly overgrow the Quince, it will not live long: if the disparity of growth is but little, a slight check of the flow of sap is occasioned, and the tree in consequence is soon brought to a bearing condition: in the first case double working is necessary; in the second, it is needless.‖

CURRANTS.—*J. R. P., Chilwell.*—The origin of the Dutch Currant is not known. Doubtless the variety was imported from Holland. Switzer, in his "Practical Fruit Gardener," published 1724, says, "The great White Dutch Currant and the Great Red Dutch Currant are the fairest, largest, and best; and the great Yellow Dutch Currant differs only in colour. All others are to be ejected out of the gardens of the curious; the English and Black Currants not being worth planting in comparison with the great dark Red and White Dutch before-mentioned, they being much improved in taste since they have been endenizened." Your account of having seen, in the garden of E. Rawson, Esq., of Pegworth, a common Red Currant-tree, bearing bright Red Currants and pure White ones on the same and different branches, some being all of one sort and some mixed, would render it not improbable that they are mere sports of one another.‖

ONIONS.—*A Subscriber.*—Underground Onions should be planted in February, in well-prepared soil, such as is suitable for other Onions.‖

TURNIPS.—*Hibernicus.*—Too early sowing, for so hot a summer, has most probably been the cause of your Swedish Turnips running so much to seed. All you can do is to cut down the flower-stalks as they spring, and use those Turnips that are the most forward as soon as possible.‖

POTATOES.—*J. D.*—The Lady's Finger Potato may certainly be obtained by applying to any nurseryman. It was exhibited at the Smithfield Cattle Show, by Mr. Chatwin, seedsman of Hungerford Market.‖

BEES.—*A despairing Bee-keeper* may console herself with the knowledge that her hard case has met with commiseration, and that we have some information for her, which she will get next week.†

BOOKS.—*M. Y.*—Both Mills' and Ayres' Treatise upon the Cultivation of the Cucumber are good works of their kind. The former was advertised in our last Number; the latter at p. 16 of the *Chronicle* of last year.‡——*L. C.*—The "Naturalists' Library" is sold in separate volumes, and can be had through any respectable bookseller. Other answers next week.†——*C. D.*—No supplement has ever appeared to Martyn's Millers' Dictionary.†——*Etonian*, who wishes to know the best work on Plan-drawing, should first make himself acquainted with practical geometry, and then he will find "Clark's Drawing," and "Chambers's Educational Course" of great use in enabling him to draw plans of greenhouses, &c., correctly.‡

HORTICULTURAL SOCIETY.—*C. D.*—We must apologise for having overlooked the questions which, being placed at the end of some other matter, were not observed. When Orchidaceous or other plants are received by the Horticultural Society from their collectors, they are distributed to such Fellows of the Society as apply for them, with the exception of specimens reserved for the Society's collection. Such distributions have been always advertised in our columns. Mr. Fortune is not allowed to collect live plants or seeds for any one; he has, however, the privilege of making collections in other branches of natural history: and if it is dried specimens of Ferns that you want, he may undertake to supply them. He is just now in Scotland. *See* Books.†——*Taproot.*—Nurserymen are admitted under the same conditions as other people. Practical gardeners may, however, be elected, upon the recommendation of the Council, upon payment of an admission fee of 1*l.* 1*s.*, and an annual subscription of the same sum, provided they have contributed to the Society some paper, of importance enough to be printed in the Transactions.†

EXHIBITIONS.—*A Subscriber.*—Zíchya inophylla, Z. trícolor, Z. prostrata, and Kennédya Marryattæ, are sufficiently distinct to be shown at the Horticultural Society's Exhibitions as different varieties in a collection of climbers.‡

LOSS OF COLOUR IN PLANTS.—*Eleanor.*—Your Horseshoe Pelargonium, the dark colour in the leaves of which was intense during the summer, but which is now so changed as to have become almost plain, has probably been kept shaded by other plants. The nearer your plant is to the glass, and the more exposed it is to the light, the darker will be the markings of the leaves. The loss of colour cannot be remedied by the use of any particular compost.‡

A PROBLEM IN PLANTING.—*Stultus* says that a gentleman in his neighbourhood being desirous of forming a plantation, has given orders to have the trees planted *irregularly*, but all *to stand 4 ft. apart*; and he wants to know how that is to be done. We are not clever enough to be able to advise him.†

NEW PLANTS.—*W. L.*—It is quite impossible for us to remember anything about the Statice you sent us. If wild in England, it was not likely to be S. tatarica. Did you say it was wild?

WARD'S CASES.—*W. J. A.*—It would not be fair in us to recommend one tradesman in preference to another. Any brass or zinc worker can make them if he has a pattern. You will find an advertisement on the subject by some respectable people at p. 449 of this year's *Chronicle*. We quite agree with you that any nurseryman who would have these cases constructed and tastefully furnished with plants would find a ready sale for them in such a city as London.†

STAGES FOR PLANTS.—*Flora.*—As you have room in your conservatory for a stage 12 feet long and 7 broad, we would advise you to procure one of a pyramidal form, so that it will present the same appearance on every side. The upper shelf might, in this case, be 6 feet long and 14 inches wide; and this would be surrounded by four tiers gradually diminishing in width thus—12, 10, 7½, and 6 inches. The latter or lowermost shelf should not be raised more than a foot above the level of the floor; the first rise might be 6 inches, the next 9, the succeeding one 12, and the uppermost 15 inches. By this means each plant will have plenty of space to grow in, and the general complaint of plants not being allowed sufficient room will be obviated.‡

BAROMETERS.—*H. T.*—Good barometers, with a properly graduated scale, may be purchased from 3*l.* 10*s.* to 5*l.* 5*s.* A rather open shed will be a proper situation for one.‡

ICE.—*A Constant Subscriber.*—It is probable that ice may be preserved without straw, or some similar material; but if so, the house must be constructed on some peculiar plan. We doubt whether any means will prove at once so convenient and cheap as packing with straw.†

LABOURERS.—*Beginner.*—It is impossible for us to say what the cost of draining will be per acre; everything depending on local circumstances, soil, and other matters, that can always be ascertained on the spot, and nowhere else. You will find some observations on the subject by Mr. Loudon in another part of to-day's Paper. In draining, your object is to get rid of all water likely to stagnate round the roots of plants: we need not add that, to do it effectually, all the drains must run towards the lowest part of your grounds.†

PIES.—*Emily.*—Much obliged for your information; and as a friend of ours who served his apprenticeship to Messrs. Flour, Butter, and Co. appears to know a little about pastry-making, we, in return, on his authority, will give you a useful piece of advice, viz.: never to put pastry *into* the dish at all; but to be contented with an extra layer of it round the margin, and never to make a hole in the crust; if you do, it will never rise well. *M.*

MISCELLANEOUS.—*Anna.*—We are sorry to say we are unable to adopt your suggestion.‡——*A. B. C.*—You do not state which species of Daphne it is that you cannot flower.‡——*An Admirer.*—Your plant is Leucocoryne ixioides, a half-hardy bulb.†——*Alpha Rosæ.*—We cannot undertake to give a list of such Roses as will be suitable for growing in pots: you must apply to the Rose-growers for information upon this point.‡——*A. P.*—Of your plants, No. 2 is Rivina humilis; 3 is a Grevillea, probably acanthifólia; 1 is in too young a state to be determined.‡——*J. C.*—Our opinion of Mr. Brown's Improved Flower-pots has been already stated at p. 863.‡——*W. Gardner.*—There will not be a meeting at the Horticultural Society's Rooms, in Regent Street, before January 17th. A fine plant of Houlletia Brocklehurstiana, in full bloom, would no doubt form an interesting feature in the exhibition of plants.‡——*Charles.*—Your Apples are, 1, 3, Blenheim Pippin; 2, Beauty of Kent.‖——*W. B.*—The work may be obtained through any bookseller.——*W. K.* had better apply to the parties advertising. Their advertisements are in Nos. 50 and 51.——*T. C.*—We are neither schoolmasters nor translators.†——*A Subscriber.*—All that we know respecting the Khelat Lucerne is stated at p. 579 of the *Chronicle* of this year.‡——*A. B.* is informed that all advertisements, not objectionable on score of morality, are admissible.——*H. D.*—Nos. 1, 5, 22, 41, and 50 for this year may be had. Payment may be made by Post-office orders.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE publication of a Royal ordinance for the formation of a Privy Council is the principal fact in our intelligence from France. The object of this measure is to provide retiring pensions for ex-Ministers, and to institute a body of public men who, without taking a responsible part in the affairs of Government, may be ready to advise the Crown on all matters of state policy whenever it may be considered expedient to consult them. The principle of the measure is discussed at great length by the Paris papers: it is approved by those of the Conservative and Liberal parties, while the Royalist and Republican organs regard it as a proof that the Orleans dynasty is gradually returning to the monarchical system of the exiled Royal Family. The Ministerial papers announce that the King of Prussia has consented to become the arbitrator between this country and France, on the long-pending question of the Portendic claims, and that negotiations are now in progress between France and the German Union for the purpose of obtaining mutual reductions in the tariff.—From Spain we learn that the Regent set out on the 22d, on his return to Madrid, without entering Barcelona. The state of siege still continues, although the law is administered with great forbearance. None but military rebels have been executed; an additional time has been allowed for the payment of the forced contribution, and nearly every civilian has been set at liberty. The proceedings of the French Consul are still the subject of angry discussion both in the Spanish and French papers; nothing can be more contradictory than the accounts published on both sides, and we shall probably not be in possession of the truth until the Chambers reassemble.—From Portugal we have further accounts of discussions on the tariff; two councils of Ministers have been held, and some additional reductions are said to be agreed upon, but it is still doubtful whether their extent will satisfy the British Cabinet. The Portuguese Government have succeeded in effecting an extensive list of retrenchments in various departments of the State, amounting to an annual saving of 40,000*l.*; and their Majesties, it is said, have promoted the measure by voluntarily foregoing a considerable portion of their income. In Germany the new tariff of the Prussian Customs League has just been published; its details, as we have before stated, are by no means favourable to this country, but it will remain in force, and without any modification, for the next three years. A new scheme for an annual meeting of officers from all the armies belonging to the German Confederation has sprung out of the prevailing spirit of union and nationality which the King of Prussia's speech at Cologne may be said to have embodied. The object of this measure is to afford opportunities of personal acquaintance to officers who may be expected to fight side by side in the event of a war; and the first meeting is proposed to be held at Leipzig, on whose battle-fields the great contest was decided which relieved Germany from the power of Napoleon.—Accounts from Greece confirm the statements published in a recent Number; the office of Minister of Finance is still vacant, and every statesman to whom the King has applied has hitherto refused to undertake its almost impossible duties; the treasury is in a state of bankruptcy, and a crisis is said to be fast approaching.—From the Levant, we have the important intelligence that the Sultan has complied with the demands of the Ambassadors by consenting to appoint a Christian Governor for the Maronite population of Syria, and a Druse Governor for the Druses. If this decision be executed in good faith, there can be no doubt that it will virtually prove a pacific solution of all the difficulties of Syria.—From the United States we have received the Annual Message of the President, delivered at Washington on the 8th inst. It enters very fully into the circumstances of Lord Ashburton's treaty; expresses a hope that it may be the means of preserving, for an indefinite period, the amicable relations happily existing between the two Governments, and declares that there is nothing in the treaty which in the slightest degree compromises the honour or dignity of either nation. The President also alludes to the inability of his Government to obtain a loan from the European capitalists, and complains in strong terms of the distrust manifested by their refusal, at a time when the Governments of Europe, though involved in debt, and with their subjects heavily burthened with taxation, readily obtain loans for any amount, at a rate of interest much lower than that offered by the United States.—By the same arrival we have news from Canada to a recent date: the Governor-General has received despatches from the home Government, approving of his proceedings in regard to the late Ministerial changes, and supporting him in all his views of colonial policy. His Excellency's health continues very precarious, and an immediate removal to a milder climate is considered indispensable. Reports are already current in regard to his successor, and Lord Eliot, the present Secretary for Ireland, is generally mentioned as the future Governor.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, continue at Windsor Castle, and are in excellent health. The Queen has been prevented by the unfavourable weather from taking her usual walking exercise in the Home Park. On Wednesday Prince Albert enjoyed several hours' shooting at Cranbourne Tower, and on Thursday hunted with his beagles in the neighbourhood of East Burnham. It is expected that Her Majesty and his Royal Highness will visit Claremont in the course of a few days; but it is uncertain whether it will be before or after Twelfth-day, which will be spent by Her Majesty at Windsor. The Hon. Miss Lister and the Hon. Miss Liddell have succeeded the Hon. Amelia Murray and the Hon. Francis Devereux, as the Maids of Honour in waiting on Her Majesty.

Parliamentary Movements.—The election of a member for Carmarthenshire, in the room of the late Mr. Jones, took place on Monday, when Mr. D. A. Sanders Davies was elected without opposition.

Official Appointments.—It was announced in Friday's *Gazette*, that the Marquis of Anglesey has succeeded the late Lord Hill in the Coloneicy of the Royal Regiment of Horse Guards, and Lieut.-Gen. Sir James Kearney, has succeeded Lord Anglesey, as Colonel of the 7th Light Dragoons. It is rumoured in the Naval circles that Capt. Richard Arthur will be appointed Capt. Superintendant of the Royal Victualling Yard and Hospital at Plymouth, in the room of Capt. Coode, and that Rear Admiral Sir Lucius Curtis, will succeed Rear Admiral Sir John Louis, as Admiral Superintendant at Malta.

Military Promotions.—The following promotions for services during the war in Affghanistan and China were announced in Friday's *Gazette*:—To be *Lieut.-Colonels* in the Army by brevet, Majors Gore Browne, Joseph Simmons, George Hibbert, Thomas Skinner, G. H. Lockwood, C. Warren, G. A. Malcolm, D. L. Fawcett, J. B. Gough, and Norman Maclean. To be *Majors* in the Army, Captains A. Ogle, G. Baldwin, M. Smith, Franklin Lushington, F. White, J. Paterson, W. Greenwood, W. R. Faber, Arthur O'Leary, C. B. Daubeney, D. M'Andrew, F. Wigston, and F. Whittingham. To be *Aides-de-Camp* to the Queen, with the rank of Colonels in the Army, Lieut.-Cols. S. Bolton, Colin Campbell, P. E. Craigie, and Edmund Morris. The following officers of the East India Company's Forces have been promoted to take rank in her Majesty's Army in the East Indies, as follows:—To be *Lieut.-Colonels*, Majors Geo. Huish, F. Blundell, C. W. Young, and John Campbell. To be *Majors*, Captains R. Cobrington, T. Polwhele, F. Abbott, T. E. A. Napleton, G. Burney, F. T. Leslie, J. H. Craigie, J. Ferris, G. C. Ponsonby, J. Alexander, W. Anderson, J. Theophilus Lane, C. Blood, W. Riddle, H. M. Lawrence, T. H. Scott, D. Fitzherbert Evans, Jas. Macadam, W. H. Simpson, F. A. Reid, R. Shirreff, T. Townsend Pears, and R. Cornwallis Moore. To have the local rank of Major in the Army in Affghanistan, Brevet-Captain F. Mackeson. To be *Aide-de-Camp* to the Queen, with rank of Colonel in the East-Indies, Lieut.-Col. G. Petre Wymer. The following officers of the Royal Marines to take rank by brevet as *Majors* in the Army, Captains James Whitcombe and F. S. Hamilton.

Naval Promotions.—The following promotions have taken place in consequence of the recent war in China. To be *Captains*:—Commanders H. Boyce, C. Frederick, C. Richards, H. Kellett, R. B. Watson, W. H. Anderson Morshead, R. Collinson, and E. N. Troubridge. To be *Commanders*:—Lieutenants J. Tudor, and J. J. M'Cleverty, of the East India Company, R. B. Crawford, C. Wyse, Grey Skipwith, J. G. Harrison, C. Starmer, J. Fitzjames, H. C. Hawkins, J. Stoddart, and P. A. Helpman. To be *Lieutenants*:—Mates A. Tylden Freese, and E. L. Strangways, of the East India Company, H. Clerke, E. W. Vansittart, A. R. Henry, H. F. Neville Rolfe, A. P. Greene, H. S. Hillyar, H. Phelps, A. Anderson, G. H. Hodgson, N. Vansittart, and C. Keats Jackson. In addition to the above promotions, orders have been transmitted to Sir William Parker, the Commander-in-Chief, to report, for promotion, the names of the Senior Lieutenants and Senior Mates of ships engaged; the services of which ships shall, in his opinion, entitle them to such reward, and who shall not be included in the foregoing list.

Order of the Bath.—In consideration of the late victories in China and Affghanistan, the Queen has been pleased to appoint Major-General Lord Saltoun a Companion of the Order of the Bath; Colonel Robert Bartley, of the 49th Foot; Colonel J. Schoedde, of the 55th Foot; and Colonel John M'Caskill, of the 9th Foot, to be Knights Commander of the Order. Her Majesty has also appointed Knights Companions of the Order, the following Officers in her Majesty's service:—Colonels C. Campbell, P. E. Craigie, J. Bolton; Lieutenant-Colonels J. Knowles, J. Cowper, W. Johnstone, C. Warren, G. A. Malcolm, D. L. Fawcett, J. B. Gough, Norman Maclean, M. White, A. B. Taylor, G. Hibbert, T. Skinner, and G. H. Lockwood.—Majors J. Grattan, J. H. Grant, T. S. Reignolds, W. Greenwood, H. C. B. Daubeney, F. Whittingham, F. Lushington, and F. White.—Also the following officers in the East India Company's Service: Colonel G. P. Wymer; Lieutenant Colonels—C. F. Wild, John Tulloch, L. R. Stacey, G. W. Moseley, J. MacLaren, A. F. Richmond, C. R. W. Lane, G. W. A. Lloyd, R. W. Wilson, F. S. Hawkins, J. K. Luard, F. Blundell, C. W. Young, and John Campbell; Majors P. Anstruther, H. Moore, W. H. Simpson, F. A. Read, T. T. Pears, R. C. Moore, W. J. Thompson, F. S. Sotheby, H. Delafosse, G. R. Brommelin, C. D. Blair, E. Sanders, T. Seaton, J. H. Craigie, J. Ferris, W. Anderson, J. B. Backhouse, T. H. Scott; Brevet-Majors R. Leech, and Frederick Mackeson. The Queen has also been pleased to appoint Captain Thomas Bouchier, R.N., a Knight Commander, and the following officers in Her Majesty's Naval Service, to be Companions of the Order:—Captains—the Hon. F. W. Gray, Peter Richards, Sir J. Everard Home, Bart., C. Richards, H. Kellett, R. B. Watson, W. H. Anderson Morshead, Richard Collinson, and Brevet Lieut.-Col. S. B. Ellis, of the Royal Marines.

Foreign.

France.—The French Government has published a Royal ordinance of the 23d inst., instituting a Privy Council, "composed of men who, without taking any part in the administration of public affairs, in the action or responsibility of the King's Government, should nevertheless be available by the Crown whenever it should appear expedient to consult them." The ordinance then specifies the posts which it is necessary to fill in order to be qualified for the new Council; the members are to be called Ministers of State, and are to receive a salary of twenty thousand francs a year (800*l.*), if the Chambers think fit to sanction the financial part of the measure, of which there is little doubt, as all Ministers, past, present, and expectant, are interested in its success. The policy of the measure is of course the leading topic of discussion in the Paris journals. The Ministerial and Conservative Papers approve of it without reserve; the organs of M. Thiers and of M. Odillon Barrot accept the principle, but disapprove of some of the details; the Royalist papers regard it as a proof that the Orleans' dynasty is gradually approaching the monarchical policy of the exiled Royal family; while the Republican and Imperial organs protest against it as a reaction against the revolution which placed the present King upon the throne, and denounce it as another step towards the re-establishment of the *ancien regime*, with all its encumbrances and expenditure. It is rumoured in political circles that this project, which is nothing more nor less than to provide retiring pensions for ex-Ministers, has long been a favourite scheme of Count Molé, who intended to have made it one of the first measures of the Cabinet he has been expecting to form, and that M. Guizot has stolen a march upon that statesman by now announcing it.—The affairs of Spain have for the moment given way to the personal interests excited by this ordinance, but the accounts of the Barcelona affair are still treated with so much contradiction, that it is impossible to come to any conclusion on the subject. The Ministerial papers assert that M. Gutierrez, the political chief of Barcelona, was guilty of a misstatement in a very important particular, and that the Regent has resolved on dismissing him from office; but whatever may be the result of his charges against the Consul, the impression still continues that the insurrection was got up in Paris, and that the authors of it were suffered to proceed with it uninterrupted by the police.—Negotiations are said to be in progress between France and the German Customs' Union for the purpose of obtaining mutual reductions in the tariff.—The Bordeaux, Havre, and Nantes Chambers of Commerce have sent delegates to Paris, with strong addresses to the Minister of Commerce, calling for the suppression of the native sugar-refining, with an indemnity to the beet-root growers; and the Chamber of Commerce of Marseilles has addressed a memorial to the Government in which it declares itself in favour of the projected Customs' Union between France and Belgium.—The Ministerial papers state that the King of Prussia has consented to become the arbitrator between France and England upon the long-contested subject of the Portendic claims.—The seizure of the Marquesas Islands has directed attention to the subject of colonization. A mercantile house in Havre has determined to despatch a ship with colonists for these islands in the course of next month; and it is rumoured that Government intend to seize the island of Madagascar with the view of forming an extensive establishment in the Indian Ocean.—In the Provinces some important trials before the civil tribunals are the chief topics of interest. The Tribunal of Fontenay (Vendée) has just been called on to decide whether a person, who had been ordained a priest, but removed from his functions, can enter into the marriage state, which the Tribunal has decided in the negative.—At Nantes a chapel for Lutheran service was lately opened, but was closed by the prefect, in obedience to the law against associations, passed in the reign of his present Majesty. The Lutherans applied to the Tribunal, which has sanctioned the law of the prefect. The Tribunal ruled, that as the Catholic religion needed the approbation of the State to open a place of worship, the Protestants also needed it. The pastors plead, on the contrary, that if the Catholic religion needs, and submits to this, it is on account of a concordat with the Pope, whilst the Protestants should enjoy the benefit of the article of the charter unshackled, which grants freedom of worship. The trial has created some sensation among the Protestants of France.—At Lyons, public attention is exclusively occupied with the trial of a man named Besson, before the Court of Assizes, on the charge of murder. The details, which have already run to great length, and have occupied the Court for seven successive days, are scarcely less remarkable than those of the well-known trial of Madame Laffarge. It appears that on the afternoon of the 1st Sept., 1840, M. de Marcellange, a country gentleman of property, was sitting in his chair, when a shot was fired from without, and he instantly fell dead. A man named Besson, who had formerly lived with him as servant, was arrested in March last on suspicion of having committed the murder. On being examined, Besson attempted to set up an *alibi*; and the principal witnesses for him were the wife of the deceased, the daughter of the Count and Countess de la Rochenegly de Chamblas, and her mother. Besson was sent back to prison, where he remained until August last, when he again appeared before the Court of the Puy de Dome. The same attempts were made to set up an *alibi*, and were supported, as before, by Madame de Marcellange and her mother. Besson was found guilty, and condemned to death. He appealed to the Court of Cassation on grounds of informality. In consequence of this, a new trial was ordered to take place before the Court of Assizes of the Rhone. This new trial commenced on the 19th inst., and is still in progress. Among the remarkable features of the case, not the least striking are the evident desire of the prosecution to elicit such facts from the prisoner himself as may implicate other parties in the charge, and the circumstance that the wife of the deceased gentleman and her mother the Countess de Chamblas have both absconded, or rather have failed to appear in Court and answer to their names as witnesses on the trial.

Spain.—Accounts from Barcelona to the 23d inst. announce that the Regent took his departure from Sarria for Madrid by the Valencia road on the 22d, without having entered Barcelona. Gen. Van Halen still remained in the city, although his successor Gen. Seaone, the new Capt.-Gen. of Catalonia, had arrived. It appears that the Regent was unable to carry into effect his project of raising the state of siege and granting an amnesty as soon as he anticipated. Although the Republicans and insurrectionists were quiet, still those who had set them on were active and determined to thwart the Government by every means in their power. Of the 25,000 stand of arms, known to be in the possession of the Barcelonese, not more than 14,000 had been surrendered; the domiciliary visits which were threatened, in order to discover them, have not yet been put in practice; the forced contribution had been reduced from 600,000 to 400,000 dollars, and a delay of a week allowed for its payment. The Regent has shown great forbearance towards the insurgents, and no use whatever has been made of the state of siege. None but Military rebels have been executed, which might have been done without martial law. Every civilian almost has been set at liberty, notwithstanding the reign of terror which the French journals depict as hanging over the city. The press of Barcelona attacks the Government as freely as in Paris or Madrid; and the Moderados in the interest of Queen Christina intrigue to turn the municipal elections against the Government. One of their agents, Señor Gibert, has been arrested for his activity in ensuring the success of the Christino candidates. Private letters condemn in strong terms the conduct of the French papers in misrepresenting the late events, and add that the English press must have had sufficient experience of French telegraphs to render any remarks on the recent announcements unnecessary. It appears that the removal of the Captain-General was considered expedient, in consequence of the excitement produced by the bombardment, but the alleged removal of the political chief has not yet been officially announced. In regard to the French Consul, nothing can be more contradictory than the accounts of his proceedings; although the late revolt is generally considered to be of French origin, it is now asserted that the charges against him were exaggerated. The affair, however, has assumed too much importance to be settled by the contradictions of the newspapers, and we shall have all the circumstances before us in an official form, on the reassembling of the Chambers. As a proof of the humanity of the Regent towards the insurgents, it is stated by the Barcelona papers that two of his aides-de-camp and his domestic physician were sent by him on the 19th to visit the wounded lying in the Military hospital. They presented, in the name of the Regent, two dollars to each soldier, three to the sergeants, and a month's pay to each officer, including a captain, who being dangerously ill in the hospital on the day of the bombardment, had his leg broken by the bursting of a shell. An official account of the loss sustained by the troops in the insurrection has been published, by which it appears to have been much smaller than it was stated to have been, even in the lowest accounts given by the Madrid and Barcelona journals. It is as follows: Killed—2 commandants, 9 other officers of various grades, and 31 privates. Wounded—6 commandants, 29 officers, and 147 privates; 2 horses were killed and 16 wounded.—On the 11th, the annual ceremony in memory of the shooting of General Torrijos, our countryman Mr. Boyd, and others, by General Moreno, who was himself shot by his own soldiers on passing the frontier into France after the Bergara convention, was celebrated with great pomp at Malaga. The remains of the victims were placed on three funeral cars.—The Madrid papers state that the decree for the dissolution of the Cortes has been signed by the Regent, and that a modification of the Ministry is considered inevitable. They also state that two battalions of the National Guard of Seville have been disarmed, as a punishment for the attempted disturbances in that city in the beginning of the present month.

PORTUGAL.—We have Lisbon news to the 19th inst. The tariff question was the great object of discussion in Lisbon. Two Councils of Ministers had been held on the subject, and it was expected that further reductions would be proposed on salt fish, and other branches of our trade, though whether to such an extent as would satisfy the British Government was of course not known. The great objection of the Portuguese was to the uniform duty demanded by our Board of Trade on all articles, so as to make the duties equivalent to 20 per cent., *ad valorem*, on each article. The Portuguese, on the other hand, have some manufactures which they wish to protect, while, on such objects as are not already reduced, they would not object to make a considerable reduction. Ministers had succeeded in completing a remarkable list of retrenchments, amounting to an annual saving of at least 40,000*l*., and it was understood that their Majesties would enter into the prevailing views of economy by voluntarily foregoing 100 contos per annum. Another captured slaver had entered from Mozambique and Pernambuco. Her Spanish name was the Relampago, and it was said her former owner came passenger on board. She entered the Tagus as the Portuguese corvette, Principe Don Pedro.

BELGIUM.—The Brussels papers state that a white marble statue of Madame Malibran has just been placed in the mausoleum which M. de Beriot had erected in the cemetery of Lacken, to the memory of that celebrated singer. The mausoleum itself is about ten feet long, and nearly as many wide. The interior is circular, and crowned with a cupola, from which a lamp is suspended, which sheds a subdued light over the whole statue.

GERMANY.—The Prussian papers publish the different alterations made in the tariff of the Prussian Customs League, or Zollverein, as the result of a meeting which was held a short time since by the commissioners of the States of the German Union at Stuttgart. The new arrangement of the tariff is to take effect from the 1st January, 1843, and to remain in force, and without further modification, until the end of the year 1845, at which period another meeting of the commissioners will take place. The details of these arrangements are by no means favourable to the commerce of England. The *Allgemeine Zeitung* of the 21st inst. mentions a plan as having been in agitation for some time, for an annual meeting of officers from all the armies belonging to the German Confederation. The object of this meeting is, to afford opportunities for personal acquaintance to officers who, in case of a war, would, it is hoped, be called on to fight side by side. The zeal which at present prevails in Germany for everything that may tend to promote union and nationality, makes it probable that the proposed plan will meet with much favour among civilians as well as among military men. It is proposed that the first meeting should take place at Leipzig, near which city the great battle was fought, the "Völkerschlacht," as it is still called there, the issue of which relieved Germany from the domination of Napoleon.—The Berlin papers, in giving an account of a concert which lately took place in that city, state that a battle overture, from the opera called "The Hero of Lancaster," and a romance, from the opera "The Tournament," both by the Earl of Westmoreland, were among the pieces performed, and were acknowledged by the German musicians to be treated with masterly skill.—The Rhenish papers give an account of an inquiry into the causes of a recent accident on the Cologne Railway, which is curious as showing the course adopted by the Prussian Government in cases where the accident is caused by carelessness or bad management. It appears that on the 11th October the engine ran off the rails between Cologne and Aix-la-Chapelle, in consequence of the negligence of one of the attendants. The stoker was severely wounded on the occasion, but no one was killed. The attendant, to whose inattention the accident was owing, has, after a prolonged investigation, been found guilty, and sentenced to three months' imprisonment, a fine of five dollars, payment of all the costs of the procedure, a dismissal from his office, and a prohibition against his ever being employed again on any Prussian railroad.—The hundredth anniversary of the birthday of Field-Marshal Prince Blucher was celebrated at Dusseldorf on the 15th inst. by a public entertainment, at which not only many comrades of the deceased Marshal, but nearly all the officers of the garrison, were present. In almost every large city in Prussia the day appears to have been celebrated in a similar manner.—It appears, from a recent statistical return, that there are in Austria and its dependencies, including its Italian territory, 25,500,000 Catholics, 3,500,000 members of the United Greek Church, 2,900,000 of the Non-United, 1,260,000 Lutherans, 2,240,000 of the Reformed Church, 45,000 Socinians, and 600,000 Jews. The number of religious houses for men amounts to 766, comprising 10,354 persons, and including 27 religious orders. The Brothers of Mercy possess 34 houses, and 542 inmates; the Benedictines, 37 houses, and 1,093 inmates; the Capuchins, 98 houses, and 1,298 inmates. There are 157 convents, containing 3,661 women.—Letters from Trieste announce the arrival of the first cargo which has been conveyed from India to that port by the Isthmus of Suez. The cargo, consisting of tea, rice, and indigo, was brought direct from India to Suez by the Indian ship Bengalee, and thence to Cairo on camels. This fact is considered to hold out the prospect of making this mode of transit available for the importation of a large quantity of Indian merchandise intended for Continental consumption, which now passes through the warehouses of London and Liverpool.—Letters from Hamburgh mention, as a proof of the mildness of the winter, that on Tuesday fortnight the men at work among the shipping threw off not only jackets, but waistcoats and neckerchiefs, as they would have done in May. There was not a particle of ice on the Elbe; but, on the contrary, the day was quite warm.

ITALY.—A letter from Florence of the 18th inst. gives an interesting account of the Agricultural society, which was formed at Turin last summer, for the improvement of husbandry in the Sardinian States, under the title of *Associone Agraria*. The object of the society is not, however, merely the alteration of the present mode of cultivation. It proposes to improve and give activity to all trades and occupations which have connexion with agriculture. What was some years ago done to great advantage with the same view in Tuscany, by the influence of the Georgofili Academy, and more recently by the Marquis Rodolphi, who has just exchanged the directorship of the model farm at Meleto for the chair of Professor of Theoretical and Practical Agriculture in the University of Pisa, appears to the Piedmontese, a considerable number of whom have made agricultural science a principal object of study, an incitement, if such were yet needed, to further efforts. Foreigners, as well as natives, may become members of the institute. Turin is to be the seat of the directory, and the President is to continue in office three years. There are to be weekly meetings for general business, besides one each month, which will have for its chief object the consideration of the state of the accounts and the expenditure. In the principal towns of the provinces, as soon as 12 members can be found, an agrarian committee is to be formed. Once every year, between the 1st of July and the 1st of November, an agricultural congress will be assembled, which will sit alternately in one of the seven divisions of the Continental states. It will also be the duty of the society to devote attention to gardening, and all occupations connected therewith. It will also watch over the rearing of silkworms, the introduction of new implements of agriculture, and new manures. The society will publish at a low price a weekly Paper; and an agricultural library, with a museum, will be established at Turin. By a Royal decree, dated August 25, the formation of the society is authorized under the direction of the Minister of the Home Department and Finance.

RUSSIA.—The Russian Journals give some details relative to Moscow, which are not without interest. Towards the end of the 17th century, manufactories of cloth, silk, cotton, glass, porcelain, and crockeryware, were established in this city, but without any decided effect until 1822, when, in consequence of the protective system adopted by the Government, Moscow became the centre of a vast number of manufactories, all in the most flourishing state. At present there are, in and about the city, not less than 1,000 of these establishments sending forth goods to the amount of 40,000,000 silver rubles a year. Upwards of 40,000 workmen are employed in those manufactories, besides 30,000 in various trades. The prosperity of the city has, in fact, increased to such a point, that all traces of the terrible fire of 1812 are entirely effaced.—The Russian Commercial Gazette states, that a lump of native gold, of the enormous weight of 2 poods and 7lb. (about 95lb. English), was found on the 7th inst. in the sands of Miass, near the mines of Zlatooust, and placed in the museum of the Institute of Mines at St. Petersburgh.—The papers also mention a singular bequest of the Princess Jadimerowski, who died recently in Russia, leaving considerable legacies to two actors, one for having made her laugh, and the other weep. The following words are found in her will, in allusion to this matter:—"Having frequented the theatre for three years, and having felt there the only real emotions of my life, I think myself bound to recompense those persons who caused me so much gratification. I therefore, bequeath to Karatiguin, who has so often made me shed such delicious tears, the sum of 50,000 rubles (about 8,000*l*.) I also bequeath to a young actor, whose name has slipped my memory, but whom it will be easy, I imagine, to discover in France, as being the person who used to play the Gamin de Paris at the Theatre-Michel, the sum of 30,000 rubles, for having so well amused me." The actor Karatiguin, mentioned above, is the Talma of Russia, and the other is M. Laferriere, of the Vaudeville. The testamentary executor, in announcing to him this intelligence, has stated that the heirs-at-law intend to contest the legacy; but, as the wishes of a testator are more scrupulously observed in Russia, than perhaps any other country in the world, it is presumed they will fail in their opposition.

SWEDEN.—Accounts from Sweden in the Frankfort papers state, that Professor Geyer, who was charged with the examination of the papers contained in the mysterious cases deposited in the University of Upsal by King Gustavus, has made his report of their contents. The chief papers are—1. The memoirs of Gustavus, written by himself, and commenced in 1765, when he was only nineteen years of age. They contain important observations on the revolution of 1772, and on the two preceding reigns. 2. The history of the house of Vasa, which, according to Prof. Geyer, displays distinguished talent. 3. The plan of the form of Government of 1772, and a plan for the regulation of the Diet of 1778. We learn also from the same quarter, that the celebrated chemist, Berzelius, was nearly killed a few weeks ago by the explosion of a retort in his laboratory at Stockholm. Fortunately he escaped with some contusions, from the effects of which he had sufficiently recovered on the 16th inst. to be able to leave his house and resume his customary avocations.

MALTA.—The Cyclops steam-frigate and the Vanguard frigate are ordered to proceed to Port Mahon, where the Formidable has been lying since she was got off the shoal at Barcelona, in order to assist in navigating her to this port, when the captain and officers will be tried by court-martial for the recent accident. The Bishop of Gibraltar arrived on the 14th in the Belvidere frigate from Barcelona; the papers state that the Bishop seems doomed to be unfortunate at sea, having experienced a terrific squall in entering the harbour, which the frigate did under a single jib.

GREECE.—Letters from Athens of the 7th instant announce, that in consequence of the insanity of the new Minister of Finance, M. Lillevergo, the office was still vacant, and the King had not yet been able to supply his place. All those to whom his Majesty had offered that department refused to accept it; and it was thought that it would ultimately devolve on a Frenchman named Guerin, who was formerly a commissariat clerk at Navarino. "The treasury," say these letters, "is in a state of bankruptcy; the public functionaries have not been paid for the last three months. A crisis is fast approaching."

TURKEY.—Despatches, by extraordinary express, from Vienna, reached the French Government on Monday afternoon, dated the 21st, announcing that a special courier had arrived in that capital with the important advices from Constantinople that the Porte had consented to the appointment of a Christian Governor for the Maronite or Christian population of Syria, and a Druse Governor for the Druses. This decision is of great importance, and is virtually a pacific solution of the Syrian question. Nothing new has transpired in regard to the affairs of Servia, but it is generally believed that the Sultan has appealed to the Great Powers against the demands of Russia, and that a conference is likely to be the result.

EGYPT.—Additional accounts from Alexandria of the 7th inst. state that the mortality among the cattle still continued, and it was calculated that upwards of 200,000 oxen had already died. The Pasha and his son experienced the greatest difficulty in ploughing and sowing the lands, and were obliged to employ for that purpose their own horses, those of the cavalry and artillery, and a number of camels. Mehemet Ali was still in Lower Egypt, and intends, it is said, to purchase the Great Western, and convert her into a steam-frigate.

United States.—The Independence New York packet arrived at Liverpool on Sunday, after a quick voyage of 16 days, having left New York on the 9th inst. A quorum of the Senate having assembled at Washington on the 8th, the President delivered his annual message. It is as usual a lengthy document, but is interesting to the English reader as the first official expression of American opinion in regard to Lord Ashburton's treaty. After alluding to the circumstances which had long threatened the peace of the two countries, and the ratification of the treaty by which these differences were adjusted, the President says, "I trust that whilst you may see in it nothing objectionable, it may be the means of preserving for an indefinite period the amicable relations happily existing between the two governments. The question of peace or war between the United States and Great Britain is a question of the deepest interest, not only to themselves, but to the civilised world, since it is scarcely possible that a war could exist between them without endangering the peace of Christendom. The immediate effect of the treaty upon ourselves will be felt in the security afforded to mercantile enterprise, which, no longer apprehensive of interruption, adventures its speculations in the most distant seas; and freighted with the diversified productions of every land, returns to bless our own. There is nothing in the treaty which, in the slightest degree compromises the honour or dignity of either nation." With reference to the question of the Right of Search, he maintains the ground hitherto taken by the American Government, and applauds the extraordinary measure taken by the American Minister in Paris, of remonstrating against a treaty already signed by the five great Powers of Europe. In close conformity with the views of the American Government, the eighth article of the treaty, he says, was framed, which provides that "each nation shall keep afloat in the African seas a force of not less than eighty guns, to act separately and apart, under instructions from their respective governments, and for the enforcement of their respective laws and obligations." "From this," he observes, "it will be seen that the ground assumed in the message has been fully maintained, at the same time that the stipulations of the treaty of Ghent are to be carried out in good faith by the two countries, and that all pretence is removed for interference with our commerce for any purpose whatever by a foreign government. While, therefore, the United States have been standing up for the freedom of the seas, they have not thought proper to make that a pretext for avoiding a fulfilment of their treaty stipulations, or a ground for giving countenance to a trade reprobated by our laws. A similar arrangement by the other great Powers could not fail to sweep from the ocean the slave-trade, without the interpolation of any new principle into the maritime code. We may be permitted to hope that the example thus set will be followed by some, if not all of them. We thereby also afford suitable protection to the fair trader in those seas, thus fulfilling at the same time the dictates of a sound policy, and complying with the claims of justice and humanity." He hopes that as the United States do not desire to interfere in the affairs of Europe, they may claim an equal exemption from the interference of European Governments in what relates to the States of the American Continent. He recommends a modification of the tariff, and insists upon the benefits to be derived from moderate duties. He recommends also the Exchequer plan submitted by the Treasury last year, and expresses his intention to effect an early settlement of the only point now at issue with England, namely, the question connected with the Oregon territory on the Pacific, to a portion of which this country lays claim. The President complains of "the mortifying spectacle" of the inability of his Government to obtain a loan so small as not, in the whole, to amount to more than one-fourth of its ordinary annual income; at a time when the Governments of Europe, although involved in debt, and with their subjects heavily burthened with taxation, readily obtain loans at any amount at a greatly reduced rate of interest. "It would be unprofitable," he says, "to look further into this anomalous state of things; but I cannot conclude without adding that, for a Government which has paid off its debts of two wars with the largest maritime power of Europe, and now owing a debt which is almost next to nothing when compared with its boundless resources, a Government the strongest in the world, because emanating from the popular will, and firmly rooted in the affections of a great and free people, and whose fidelity to its engagements has never been questioned—for such a Government to have tendered to the capitalists of other countries an opportunity for a small investment of its stock, and yet to have failed, implies either the most unfounded distrust in its good faith, or a purpose, to obtain which, the course pursued is the most fatal which could have been adopted."—The Columbia steamship arrived at Liverpool on Thursday, with news seven days later than that brought by the Independence. It consists chiefly of the usual lengthy reports from the Secretaries of the Navy, War, and Post-office Departments, but has no interest for the English reader.

Canada.—The Canada papers come down to the 2d instant. The *Kingston Gazette* states, that "his Excellency the Governor-General has received, by the Acadia, despatches highly approving of his policy as regards his recent ministerial changes, and sustaining him to the fullest extent." His Excellency's health continues very precarious, and his medical attendants have advised an immediate removal to a more genial climate.—The accounts by the Columbia confirm the preceding advices, and state that Sir Charles Bagot continues in a declining and dangerous state; his medical adviser had recommended a removal to a warmer climate, but he was too ill, and great fears were entertained respecting his recovery, which seems extremely doubtful. It was rumoured in Toronto that Lord Eliot, the Secretary for Ireland, is likely to be Sir Charles's successor.

New South Wales.—A statistical return has just been published by Mr. E. Deas Thomson, Colonial Secretary, relative to our Australian colonies, exhibiting the progress they have made within the last ten years, which is in many respects remarkable. The total value of imports into New South Wales, including the district of Port Philip, was 604,620*l.* in 1832, and 2,527,988*l.* in 1841; the value of the exports was, respectively, at the same periods, 384,344*l.* and 1,023,397*l.* These returns show the remarkable fact of a gradual increase of trade up to the year 1840, at which point it abruptly ceases; the next year showing a considerable decrease. In the returns which regard the district of Port Philip separately, however, the same decrease is not observable in the exports. The amount for which this place figures in the total above stated for 1841, is, for imports, 335,252*l.*, and 139,155*l.* for exports. The total value of the imports of grain into the colony, including Port Philip, was, in 1832, 13,365*l.*, and in 1841, 201,632*l.*; the returns in this particular show the same decrease which affected the whole trade in 1841, the article flour and bread forming the sole exception, and, on the contrary, showing a considerable increase. The return of land in cultivation throughout the whole colony, at the close of 1841, shows the principal produce to be wheat and maize, of which the number of acres is, respectively, 58,605 and 25,004, producing 832,776 bushels of the one, and 503,803 of the other. The number of ships built and registered in the colony was 21 in 1832, the total tonnage being 2,143; and in 1841 the number was 110, the tonnage being 11,250. The revenue from the sale of Crown lands in the colony was, in 1832, 12,509*l.* 13*s.* 10*d.*; in 1840 it was 316,626*l.* 7*s.* 5*d.*, having gradually increased every year till then, and in 1841 it fell to 90,387*l.*

CITY.

Money Market, Friday.—Consols left off 94 to 94⅛ for the account; Bank Stock, 171 to 172½; Three per Cents. Reduced, 94⅛; Three-and-a-half per Cents. Reduced, 101½ to ¼; and India bonds, 50*s.* to 52*s.* premium. Canadian Debentures at 1¾ premium, Exchequer Bills, 60*s.* to 62*s.* premiums.

Metropolis and its Vicinity.

The Christmas Holiday.—On Monday, in consideration that Christmas-day occurred on a Sunday, the principal merchants, warehousemen, and firms in the City suspended business for the day, in order to afford the individuals connected with their establishments an opportunity of participating in the festivities of the season. Throughout the day, the warehouses in Aldermanbury, Eastcheap, Watling-street, Wood-street, Bread-street, Friday-street, Old 'Change, St. Paul's Churchyard, &c., were entirely closed; and in the course of the day the example was followed by the shopkeepers in different parts of the City. During the day, the streets and all the leading thoroughfares were almost entirely free from carts, waggons, and other vehicles containing packages and merchandise. The workmen employed at the New Royal Exchange, the Houses of Parliament, the Nelson Column, &c., were not required by the contractors to attend at work. An opportunity was thus afforded to thousands in the Metropolis of enjoying themselves by visiting the various institutions, and they were greatly favoured by the mildness and fineness of the day. The British Museum, the National Gallery, the Thames Tunnel, &c., had an immense concourse of visitors. Up to four o'clock, the hour at which the Museum closed, the number of visitors was nearly 30,000, being more than twice the number of last year. Notwithstanding this extraordinary concourse, their conduct was most orderly; no damage was done; they behaved with perfect decorum, and not a single case of drunkenness occurred. At the Polytechnic Institution, not less than 5000 persons had visited it up to 9 o'clock in the evening.

Custom-House.—The Government *Police Gazette* this week contains the offer of a reward of 10*l.* for the discovery and apprehension of a person named William Burnby, against whom true bills of indictment were returned by the Grand Jury at the last sessions of the Central Criminal Court for perjuries committed by him on his examination before the Surveyor-General of the Customs respecting the conduct of certain officers of the Custom-house and others, against whom warrants have been issued.

Income Tax.—The inhabitants of the wards of Bridge and Queenhithe have followed the example set them by the wards of Tower, Broad-street, and Langbourne, and have passed resolutions denouncing, in strong language, the oppressive character of the Income and Property Tax, and reprobating the vexatious conduct pursued by the surveyors and assessors entrusted with carrying its provisions into effect. The wardmote of Bridge Ward in their resolution state their opinion, "that the conduct of the surveyor of taxes has been arbitrary and unjust, in unnecessarily and vexatiously surcharging nearly one-half of the inhabitants of this ward on their honest return of rental, by which they have sustained considerable injury and inconvenience." The Queenhithe Ward call for its immediate abolition, and state that they have great reason to complain of the assessments in general exceeding the returns made, and deplore the great loss of time incurred by the citizens in being compelled to appeal against them.

St. James's, Westminster.—Mr. Peter le Quainter, formerly of Piccadilly, who died in 1783, left the residue of his personal estate, since invested in the purchase of 8,785*l.* 5*s.* 9*d.*, Old South Sea Annuities, to the rector and churchwardens of this parish for the time being, upon trust, that the proceeds thereof be for ever at Christmas equally divided among 20 poor persons who had been housekeepers in the parish, and such as the rector, churchwardens, and vestry, should deem proper objects to partake of the same. According to this annual custom, the distribution of the bequest, amounting to 263*l.* 11*s.* 2*d.*, was made by the rector and vestry on the 21st inst., when 20 persons coming within the terms of the testator's will, some of whom were once in affluent circumstances and possessed large houses in the parish, received their shares of the bounty, being 13*l.* 3*s.* 6*d.* each.

British American Association.—The Committee appointed on the 7th inst. by the Council of this Company, to investigate the charges brought against the management, delivered their report on Friday. Sir W. Ogilvie, Bart., presided. This report which must necessarily be considered an *exparte* document, stated, that the Committee have met from day to day, and have had before them the whole of the books, documents, papers, and accounts, connected with the formation and objects of the association, and have submitted the whole of the executive officers of the establishment to a strict examination; and, from a full revision of the circumstances, they have arrived at conclusions totally at variance with the facts stated in evidence at the Mansion House. Among these conclusions they state that the whole of the charges brought against the association, on some recent proceedings at the Mansion House, were unfounded in truth, and wholly unsustained by evidence; and they of course condemn the conduct of Sir John Pirie, then Lord Mayor, in writing the letter to the Duke of Argyll, which has led to the withdrawal of his Grace and other influential noblemen, from the lists of the supporters of the association. In regard to the passages of emigrants, they state that they have instituted the most searching inquiry into every circumstance connected with the deportation of the emigrants in the brig Barbadoes to Prince Edward's Island; and fully exonerate the association from every charge preferred against it, in connection with that vessel, at the Mansion House, and more particularly by the press. They state their belief that, the various properties acquired for the association, considered in reference to its joint objects of emigration and colonization, have been selected with judicious care, and are such as to afford a prospect of certain annual returns upon the capital to be invested. They conclude a long report, by recommending, among other things, "That the steps adopted towards procuring a charter be persevered in, and immediately advanced to completion; that the full number of commissioners provided by the constitution of the Company be immediately made up and established in office; and that an enlarged prospectus be issued, detailing the properties acquired, and setting forth more fully the sums required to be immediately provided, with estimates of the probable returns on the capital invested." On the motion of Sir R. Broun, Bart., the report was received. The meeting was afterwards addressed by Sir J. Hay, Bart., Dr. Rolph, and other gentlemen, and the recommendations of the report were unanimously adopted.

Anti Corn-Law Meetings.—A General Committee has been formed in London for the Metropolitan boroughs, for the purpose of collecting subscriptions in order "to promote free trade by the abolition of the corn and provision laws, and all other monopolies." The list already published includes the names of Earl Radnor, Lord Kinnaird, Lord W. Russell, Admiral the Hon. D. P. Bouverie, Sir De Lacy Evans, Col. Thompson, and the following Members of Parliament, Mr. Humphery, Mr. Gore Langton, Mr. Hume, Mr. Wynn Ellis, the Hon. C. P. Villiers, Mr. Milner Gibson, Mr. Marshall, Mr. Robt. Scott, Mr. Ewart, Dr. Bowring, and Dr. Elphinston.

Police.—On Christmas-day, a young man named Leary, a journeyman shoemaker, was murdered by his master, a man called Meaghan, a dealer in second-hand boots and shoes in Whitecross-street. The man, his wife, and the workmen lived together in the same house, and had gone out to spend the evening with some friends. The master, who appears to have been jealous of the deceased, returned to his house unexpectedly, when a quarrel arose, in which he stabbed the journeyman with a knife. The inquest was brought to a close on Thursday after a long examination, when the jury returned a verdict of "Wilful Murder against Michael Meaghan," and expressed their opinion that there was no evidence to implicate the female prisoners as accessaries before the fact. The details would have little interest for our readers.

The Model Prison.—The commissioners of this new prison have received a communication from the Secretary of State, approving of the dietary, rules, and regulations for the government of the establishment, and have determined that the prison shall be occupied by a certain number of such convicts as may receive the sentence of seven years' transportation at the ensuing Epiphany quarter sessions. By one of the rules of the establishment, the term of imprisonment will extend from two to three years; but this will, in a great measure, depend upon the good conduct of the prisoner; for, in case of refractory behaviour, he will at once be removed from Pentonville to the hulks, to undergo the full term of his sentence. The convicts will be constantly employed in various useful trades, for which purpose each cell is fitted up with gas. The hours of labour will be from six o'clock until eight at night in the summer, and from seven to seven in the winter. A county gaol upon the same plan as the model prison is about to be erected at Reading, and a similar one will be commenced at Gloucester in the ensuing spring. A third is ready for occupation near Bath.

Kensall Green.—On Thursday, a large meeting took place at Maida Hill, for the purpose of promoting by subscription the erection of a church in the Kensall Green district, the Bishop of London in the chair. His Lordship said that the district of Kensall Green, which included portions of Paddington, Kensington, Chelsea, Hammersmith, and Willesden, contained upon an average 3,000 inhabitants, a greater proportion of whom were destitute of church accommodation. This, together with efforts which had been made in those districts, sufficiently indicated the necessity which existed for taking the present steps; and he believed, that so soon as the proposed church should be built and consecrated, the committee would be able to obtain an endowment from the owners of the ecclesiastical property in the parish of Willesden, and likewise assistance from the ecclesiastical commissioners in the shape of a stipend for the minister. The Dean and Chapter of St. Paul's, to whom the property principally belonged, had not only expressed their concurrence in the measure, but had presented contributions to the fund. Although the wants of the Metropolis were the first to be considered, still, as members of the Church, they must not forget to extend their sympathies to the more destitute districts on the outskirts of the diocese. Resolutions in support of the proposed object were then proposed and carried, and the meeting was addressed by several clergymen connected with the district. The Bishop, in conclusion, said, that out of the 50 churches, for the erection of which he had made an appeal to the public some years since, 42, from the liberal manner in which that appeal had been met, were now either completed or in progress. The amount of subscriptions received during the day's proceedings amounted to 120*l.*

Kennington.—An order has been issued from the Home-office for the erection of a new police-court at the Newington end of Kennington-lane, a short distance from the Elephant and Castle. This court is intended to relieve the Union-hall magistrates of part of their business, and the building is to be completed by March, 1844.

Hackney.—The churchwardens of this parish have addressed a letter to the daily papers, representing that the proceedings at the late meeting respecting the church-rates were inaccurately reported. They state that an amendment against the adoption of their estimate was moved by Mr. Offor, and negatived by 82 against 29, and that the rate was carried by 83 against 29 dissentients. They also desire to state distinctly, that no expression was used by the proposer of the rate implying that the churchwardens would feel themselves at liberty to excuse from the payment of his due proportion of the rate any conscientious objector to the principle. Mr. Offor has since replied to this letter, stating that the preceding report was substantially correct.

Woolwich.—The daily papers have been requested to contradict a paragraph which appeared some days since with their intelligence from Woolwich, and was copied into our Paper last week, to the effect that Captain W. Allen was about to recommission the Wilberforce, and was anxious to return with her to the coast of Africa. The gallant officer to whom this task was thus ascribed has heard nothing of his being appointed to any such service, and has no desire to be again engaged in the Niger expedition.

Gravesend.—On Wednesday a meeting of the inhabitants of this town was held for the purpose of adopting measures for obtaining the repeal of the Income Tax. The meeting was addressed by several gentlemen, who though in many instances differing in general politics, concurred in denouncing the impost as the most oppressive of modern times. A petition to the House of Commons was then adopted, denouncing the tax as "inquisitorial, oppressive, unequal, and therefore unjust," and stating their opinion that "the regulations and ceremonies to be observed in appealing, and in cases of persons of small incomes in obtaining repayment of their duties, are so numerous and unintelligible, that large sums are by these means alone extracted from the pockets of her Majesty's subjects, contrary, as the petitioners believe, to the intention of the Legislature." Upon these grounds they pray for an immediate repeal of the Act. It was then resolved that the petition be entrusted to Lord John Russell for presentation.

Mortality of the Metropolis.—The number of deaths registered during the week ending, Dec. 17, was 966:—males 472, females 494; weekly average, 1838-9-40-41—males 467, females 445. The distribution of this mortality over the different districts was as follows:—West, 147; North 190; Central 182; East 224; South 223.

Provincial News.

Agricultural Districts.—Three stacks of wheat and one of barley were fired on Sunday week, at Tickhill, in Yorkshire, on the property of Mr. Amery. As there were no engines at hand, the stacks were completely destroyed, with the exception of about a waggon-load of wheat. A large reward has been offered for the apprehension of the incendiary.—In Lincolnshire, on Tuesday week, the stack-yard on the farm of Mr. Dawson, of Strubby, near Alford, was fired, and nine stacks of wheat and two of straw were consumed before it was possible for the engines to reach the spot.—In Essex, a farm at Little Horkesley, occupied by Mr. G. Sadler, was fired on Thursday, the 22d. The barn and wheat-stack, distant 300 yards from each other, were found in flames at the same time; two wheat-stacks, the produce of 26 acres, were destroyed, and the outbuildings much injured.—On Thursday week, a fire occurred near the village of Westonzoyland, a few miles from Bridgewater, in consequence of a fire-balloon, sent up by a man calling himself the Wizard of the South, having taken fire and fallen upon the stack-yard of Mr. Taswell at that place. In consequence of the strong wind that prevailed, it was impossible to arrest the progress of the fire, and in a short time the whole premises were enveloped in flames, consisting of barns, outhouses, besides the whole of the stock in the stack-yard. For an hour and more the fire was distinctly seen at Bridgewater, whence an engine was despatched to the spot, but was unable to reach it until the entire property was consumed. In the course of the following day, the "Wizard" was taken into custody, and underwent an examination before the magistrates; but as there was no doubt that the occurrence was an accident, he was afterwards discharged.

Barnstaple.—We noticed in our last the speech delivered by Earl Fortescue at Barnstaple, in which his Lordship adverted to the change of opinion on agricultural prospects ascribed to Mr. Acland, M.P. for West Somerset, in consequence of his recent speech at the Yeovil dinner. Mr. Acland has now addressed a letter to Lord Fortescue, disclaiming in decisive terms the change of opinion supposed to have been expressed by him on that occasion. The following passage contains the explanation of those remarks, which appear to have been misreported by the local papers from which the report was derived:—"It is the more necessary that I should allude to your Lordship's remarks, because the report of your Lordship's speech contains what appears to be one continuous extract from my own; whereas, in fact, the words are taken from two distinct passages—the one relating to agriculture, and the other to the glove trade; I believe that my only direct allusion to legislative questions affecting the agricultural interest was confined almost to a single sentence, in which I stated that I had nothing to regret in having supported measures which I believed to have been dictated by fairness and moderation, and by a due consideration of the various interests of the country. I then expressed my satisfaction that just protection had been secured to the glove trade, in which Yeovil is so deeply interested, and ventured to advise the glove-manufacturers not to place so much reliance on protection as to relax their exertions for the improvement of their manufacture; and I added that the best security, alike for agriculture and manufactures, is to be found in the direction of increased intelligence to the object of producing the best article 'at as low a cost as possible;' not, as I am reported to have said—'at the lowest price,' in reference to the price in other countries, but at as low a cost as possible, in reference to the circumstances of England. This I believe to be the substance of what I stated at Yeovil, and it does not appear to me to justify the charge of a change of opinion. To cheapen the cost, as well as to increase the quantity, of production by encouraging improvements in agriculture, appears to me one of the main objects of agricultural associations; and the more completely they succeed in promoting this object, the more unanswerable, in my opinion, is the claim of the British farmer to fair protection: of such protection I am now, as I ever have been, the decided advocate. In the present circumstances of this country, protection to agriculture is not, as far as I can judge, too high; I earnestly hope that it may not prove too low. I never sought to obtain favour by professing to advocate exclusively, or to an extreme length, the claims of any one interest; and, therefore, I am not open to the charge of inconsistency, for speaking now in a tone of moderation which I have maintained under other circumstances."

Birmingham.—The sittings of the National Complete Suffrage Conference commenced in this town on Tuesday. The delegates assembled in considerable numbers; many of them came from the extreme parts of the kingdom, a large proportion being from Scotland. The business commenced with the election of Mr. Sturge as chairman. A long dispute arose on the manner in which the council had classified the delegates, with the view of separating those whose credentials were correct from those who had been irregularly elected. Several motions and amendments were moved, and a committee was at length appointed, to whom the examination of all disputed elections, and all applications for admission for which no credentials had been received, might be referred. At the close of the day's proceedings, an angry discussion arose between the members of the Complete Suffrage Association and the Extreme Chartists; and the meeting was adjourned without any probability of a settlement. On Wednesday it was evident that a complete separation had taken place; and when a Mr. Beggs, the Nottingham delegate, moved "that a new Bill of Rights, compiled at great expense, and based upon the most extensive suffrage, by the association, should be made the basis of discussion in the conference," Mr. Lovett moved an amendment, "That the People's Charter form the basis of discussion." A debate ensued, in which nearly 50 persons spoke for and against the amendment; and at 8 o'clock in the evening a vote was taken, when the numbers were declared to be, for the motion, 94; for the amendment, 193; absent, 73; neutrals, 14. At the close of the voting, Mr. Sturge said he could no longer consistently sit as chairman of the meeting. He felt he could best serve the cause of the people by continuing to work in connexion with the association which had called the conference. Mr. Sturge and his friends then left the room, which was immediately occupied by Mr. O'Connor and his followers for the discussion of the Charter. The Complete Suffrage party have since met in one of the hotels, where they are still engaged in discussing their bill.

Blandford.—The Blandford Agricultural Meeting took place on Saturday last, Mr. H. C. Sturt, one of the county members, in the chair. The other members, Lord Ashley and Mr. Geo. Bankes, were also present. The proceedings are reported at great length in the *Dorset County Chronicle*, but the most important part is that which gives the opinions of the county members on the prospects of agriculture. Mr. Sturt, the chairman, speaking on this subject, said, "I believe I may state that I am uttering the opinion of all the landowners and farmers of England, when I say that we do not require such protection as may injure the general interests of the nation—that we do not require any further protection than such as will prevent us from being crushed by foreign competition. In the situation of this country, and the burthens we have to bear, we are not able to contend with unlimited competition; and while such is the case, it is our determination, with all our might—and our might is great—that there shall be protection, that we will have fair protection. We wish this to go forth to the public, for we require nothing but justice. We are ready to meet our fellow-countrymen upon the merits of the case; we will submit the question to fair reasoning, but we are not to be cajoled, or flattered, or frightened out of protection."—Mr. Bankes then spoke at great length on the recent measures of Government in regard to the Corn-laws and Tariff. After alluding to the speech of Earl Fortescue at Barnstaple, noticed in our last, and to his Lordship's prognostications of further changes, he said, "I perfectly agree with Lord Fortescue that the agricultural interest must be taken only as a portion of the interests of this great empire, that changes must sometimes be made to accommodate these various interests, and that in all changes some parties must suffer. I have no wish to overrate the agricultural interest, or to pretend that it is exclusively entitled to attention over all the other interests of the State; but I will not consent to see agriculture undervalued. I will not consent to see its interests put out of the place which they are entitled to hold, and ever have held since this country became a great and happy nation. I too have looked at the political horizon, and I have seen there the agricultural interest as the sun of our social system, gilding with its radiance the spire of our church, the towers of the palace, and the thatch of our cottager's roof. I have seen public credit and national security grow and prosper in this sunshine—with it they flourish; without it they die."—Notwithstanding Lord Fortescue's opinion, he (Mr. Bankes,) did not think there will be any attempt on the part of ministers to introduce further changes during the next session of Parliament. He did not apprehend any further changes, and he knew that many of those who voted in favour of the late alterations, did so vote because they considered them as the settlement of a great question. The effect of those alterations may, nay must, for a time, unsettle and perplex the interest which they affect; it was true that agriculture is depressed, but persons of the highest authority in such matters, persons who have the deepest stake in this interest, say that it will soon be relieved. "But be that as it may, let us take care of this—let us take care that the evil day, be it short or be it long, shall not fall upon those who are less able to bear it than ourselves—let it not fall upon the labourers. We have all against a rainy day tight roofs and blazing fires: let not these comforts be wanting to the poor. To-morrow, on the great anniversary of Christian thankfulness, we shall each in our happy homes, enjoy the social circles of relations and of friends, and trust me, our own cheerful hearths will seem to burn the brighter when we remember that our cottagers have bright hearths and cheerful circles too."

Brighton.—In pursuance of an order issued by the high-constable, Monday was kept in this town as a holiday, in commemoration of the victories achieved by the British arms in India and China. The observance was very general, almost every shop in the town being closed; but the weather was so boisterous, that the holiday-folks were unable to leave Brighton. A similar demonstration took place at Lewes, where business was completely suspended.

Carmarthen.—During the stormy weather which prevailed on the Welch coast last week, a Prussian galliot was driven on shore on the Cefu Sidan sand-bank, in the bay of Carmarthen. She was on her voyage from Leghorn to Hamburgh, and had on board a statue of Diana and other sculptures, executed for the King of Prussia by German artists resident at Rome. The crew consisted of the captain, mate, and three sailors; the captain's wife and two children were also on board. Of these, all were saved except one little boy, the captain's son, who died from exhaustion and exposure to the weather. The vessel has become a total wreck, and is embedded in the sands; but it is expected that some of the marbles may be recovered.

Falmouth.—The line of telegraphs which Mr. Duckham proposes to erect from the Lizard to Portsmouth for the purpose of communicating with vessels at the mouth of the Channel, and reporting their arrival, has received the patronage of the Admiralty, Ordnance-office, and Lloyd's; and the Postmaster-General has transmitted a set of flags, to be used when in communication with merchant-vessels having mails on board from foreign countries, or with her Majesty's packets.

Ipswich.—A vestry meeting was held last week in the church of St. Margaret's, in this town, for the purpose of considering the propriety of removing the pews of the church, and substituting open benches in their stead, with the view of throwing down all distinction between rich and poor among the parishioners, and destroying assumed property in pews held by faculty, prescriptive right, or other tenure. The meeting was fully attended; the incumbent of the parish in the chair. Mr. Fonnereau, the originator of the meeting, addressed the parishioners at some length, and volunteered to give up, for general purposes, the pew in the church which had been in his family for five generations, and for upwards of a century. The proposal for the adoption of open benches was adopted by a very large majority, and the doors of the pews are to be forthwith removed, and the church thrown open to all. This example has since been followed in Harwich and other places.

Isle of Man.—A memorial from several mercantile houses in Leeds has recently been transmitted to the Board of Trade, expressing their opinion of the injustice of levying a tax of 2½ per cent., and, in some cases, 15 per cent., on British goods imported into the Isle of Man; and they further state their conviction that such a form of taxation is detrimental to the manufacturing and other trading interests of the United Kingdom, whose goods, they submit, should go free into that part of her Majesty's dominions. In reply to the memorial, a communication has been received by the merchants, stating that the Board does not at present see any sufficient reason for an alteration in the coasting system.

Leeds.—The local papers mention, as a proof of the expenses of Acts of Parliament, that the cost of procuring the Leeds Improvement Act and the Leeds Burial Ground Acts amounted to the sum of 7,026*l.*; and that the cost of the Leeds Water Works Act amounted to 9,000*l.*

Leicester.—The Duke of Rutland has addressed a letter to the Leicester papers explaining a misconception in the reports of his speech at the late anniversary of the Leicestershire Agricultural Society. His Grace says—"In alluding to the new Corn duties, I am reported to have said, that 'I had several letters in my possession written by intelligent farmers, and showing that even the present modified scale might be reduced by some shillings a quarter.' Now what I did say, or at least what I intended to say, and what I firmly believe I was understood to say by the very numerous company on that day assembled, was, 'that while the measures now in operation were in progress through Parliament, I had received several letters from intelligent farmers, containing scales of duties of their own, each of which was several shillings a quarter under the former duties; which gave me the impression that the growers themselves were prepared for some alteration.' This is widely different from 'several shillings per quarter lower than the present modified scale.' With regard to any intention on the part of the Executive to reduce still further the duties which protect agricultural produce, of which intention my misrepresented expressions are said to have been 'ominous,' I can only assert, that I am as entirely ignorant as I am utterly incredulous of it. My object at the Leicester Agricultural Meeting was to give all the information which I had been able to collect, for the purpose of preventing and of allaying any unfounded alarms. I stated my inability to give an opinion as to the results of the new tariff in these early days of its operations; and I expressed an earnest hope that the occupiers of land would continue to give employment, and to afford protection and kindness to their labourers, rather than make any change in the condition of the latter class, under circumstances of depression which I had every reason to hope would prove temporary and fleeting. To these sentiments I most conscientiously adhere, and I am convinced that those, at least who know me, will give me credit for an anxious disposition to share in all the difficulties which may be brought unexpectedly upon my tenantry, if I should be deceived as to the fleeting nature of that depression."

Liverpool.—Some further particulars of the great fire noticed in our last have been received. It is said to have been caused by one of the men employed on the premises having incautiously carried into the still-room a lighted stick, in order to ascertain if the stills were full. Of course the fire, once communicated to a material so combustible as turpentine, spread with great rapidity, and it was not long before the whole premises were enveloped in flames. The premises were insured in 15 offices for 45,880*l.* This is the third great fire which has occurred in Liverpool this year. The loss of property arising from the late one, near the Clarence Dock was, it will be remembered, upwards of half a million; and the insurance-offices have suffered so heavily, that some of them have declined, in particular localities, to increase their policies.

Manchester.—A meeting of the Anti-Corn Law League took place on the 22d, Mr. J. Wilson in the chair, supported by Mr. Cobden and Mr. Brotherton. The report alluded to the progress made by the pecuniary contributions in different parts of the kingdom, and to the numerous votes of approbation expressed towards the League by some of the largest meetings in the country districts. The names of Lord Kinnaird, Earl Ducie, and Earl Radnor were announced as having joined the League since the last meeting. Mr. Cook, of Liverpool, in nominating registrars, said that the sum of 1,850*l.* had been subscribed towards the fund in that town, 1,500*l.* of which had been contributed by 80 persons. Mr. Brotherton and other gentlemen then addressed the meeting on the usual topics connected with the objects of the League.

Merthyr.—The Welsh papers state that great satisfaction has been created in the Principality during the last few weeks, by the announcement, that the Messrs. Bailey of Nantyglo had discovered in that district the seam of iron-ore well known in Scotland under the name of Mushet's Black Band. It appears that it has also been discovered in the Anthracite district.

Portsmouth.—We learn from the *Hants Independent* that it is contemplated by the present Admiralty, in the ensuing spring, to make a considerable alteration in the establishment of the different ordinary guard ships, by endeavouring, if possible, to do away with the expense of one of the ships at each port, allowing the flag of the Rear-Admiral Superintendent to be hoisted on the sheers in the dockyard, as is the case in other countries.

Preston.—The local papers mention, as an instance of the progress of machinery, that the principal manufacturing concern in this town will, after the whole of the contemplated improvements are completed, have, besides other machinery, 1,440 power-looms, each of which will be able to produce weekly six pieces, of 25 yards, making a weekly aggregate of 122 miles and 280 yards of cloth.—The *Preston Chronicle*, a short time ago, gave extracts from a petition signed by 194 members of the Roman Catholic congregation of Brindle, addressed to their Bishop, requesting him to prevent confessors from making the wills of their penitents in their own favour, and to oblige the Rev. Thomas Sherburne to restore the Brindle property to the natural and legal heirs. This petition having met with no attention from the Bishop, a copy of it has been sent to the Pope; and it is now stated by the same authority, that a person high in office is expected in Lancashire from the Court of Rome to investigate the accusations brought against certain members of the Roman Catholic clergy in this part of the country.

Sheffield.—The draft of the Charter of Incorporation of this town has been completed, and is found to agree, in its main features, with those granted to other boroughs. It provides that the borough shall consist of nine wards; four for the township of Sheffield, and one for each of the out-townships. There are to be 42 town-councillors; six each for the four wards of Sheffield and the ward of Ecclesall, and three each for the wards of Upper and Nether Hallam, Attercliffe, and Brightside. The number of aldermen will be 12.

Stafford.—A meeting was held at Brigg a few days ago, composed of persons of various political views, when it was resolved that some testimonial of approbation should be presented to Lord Worsley, in acknowledgment of his support of the agricultural interest. A numerous committee has been formed to give effect to the resolution.

St. David's.—The charge of Dr. Thirlwall, bishop of this diocese, has just been published. It was originally delivered in the Welsh language, and is in other respects considered a remarkable document in reference to the present state and prospects of the Church. The bishop strongly insists on the necessity of maintaining the unity of the Church against the progress of dissent; he expresses his desire to organise the clergy under their regular authorities, the archdeacons and rural deans, to make them adapt their personal teaching to the course of the Christian year, as laid down by the formularies; condemns all inconsistent compromises with schismatical bodies, and warns his clergy against disobedience to the spirit or letter of the rules of the church, which he desires to strengthen by a deliberate development of her own powers on her own principles, and within her own sphere. In regard to the Oxford controversy, he states his decided belief that the alarm generally felt at the progress of the new opinions is perfectly groundless. Most of the differences of the Oxford school are, in his opinion, differences of words and not of principle; and while some of their applications are pronounced to be quite untenable, he states that he "can only treat it as a matter of mutual congratulation for himself and his clergy, that, for whatever cause, a spirit should have been roused which has engaged so many powerful and active minds in the cultivation of theological learning." "It cannot, he says, be denied, that expressions have been deliberately used which clearly imply a certain degree of dissatisfaction with the present state of the Church—a certain desire of change—a certain regret, mingled with disapprobation, at the course pursued by some of our reformers, and especially at the extent to which they were swayed by foreign influence. But I have yet to learn that such views and feelings are inconsistent with the obligations of a minister of our Church, or with a sincere attachment to her. I know of no authority that is entitled to prescribe to any of us the opinions which he must hold on the history of the Church, or the lessons which he must gather from it; and I have no wish to see such an authority established, whether it is to be administered by a few or by the many. Rather, I would say, we cannot be too cautious of every approach toward such an odious and pernicious species of spiritual tyranny. If any one is convinced that the Reformation has left nothing to desire, and that it has taken nothing away that we ought to regret, he may well be content with the pleasure of such a belief, without seeking to force it upon others as a duty. I would only observe, that a contrary persuasion is, at all events, nothing peculiar to any party in the present controversy. It has been alleged as an objection against the movement which gave rise to this controversy, that its tendency is directly counter to the spirit of the age, and betrays that its authors have been misled by a blind antipathy which prevents them from discerning between the good and the evil in the character of their own times. I do not know whether the fact warrants the inference; but doubtless so to set ourselves above the spirit of our age would be no less foolish and blameable than the idolatrous admiration which bows to it as infallibly wise and perfectly good. I would only observe, that if such be the real nature of the movement, there can be little reason for alarm about its progress. It is as if one should dread a series of encroachments on the bed of the sea because an attempt has been somewhere made to shut it out by a dike."

Wakefield.—We lately noticed the failure of an extensive agricultural firm in this town, which had severely affected the farming interests of Yorkshire. We now learn that another still more serious failure occurred last week, Mr. Dunn, an extensive corn-dealer in Wakefield, having suspended payments. The liabilities are said to be about 300,000*l.*, and to extend over the whole country.

Warwick.—The western district of this county was thrown into great excitement on Christmas-day, by the occurrence of a domestic tragedy, committed in open day, and in the presence of several witnesses, at the farm-house of Mr. Crowley, at Spernall, a small village near Alcester, and not ten miles from Rouse Lench, where a man was murdered a few days since, under circumstances of much mystery. In the present case the assassin was James Crowley, the youngest son of the gentleman above named. It appears that he has at many previous times committed violent assaults, and held out threats against various persons on the premises, his anger being directed more bitterly towards his father than any one else. On Christmas-day he threatened to take the life of his own parent, for which purpose he posted himself before the house, armed with a double-barrelled gun. A young man named Tinsley, one of Mr. Crowley's labourers, had been sworn in as a constable some time before, as a measure of precaution. As soon as the alarm was given, this constable proceeded with two assistants for the purpose of taking the assassin into custody. As they approached he made some passionate exclamation as to their taking him, levelled the gun, and shot the constable through the head, the charge of one barrel passing into his forehead, and killing him instantly. He then coolly dared the assistants to approach and receive the contents of the other barrel. His evident determination paralyzed them and they retreated. The murderer then went off to his lodgings, mounted his horse and rode away, and up to the present time has not been captured, although a reward has been offered for his appehension. The father, who is well known to the agriculturists of the midland counties, is a tenant of Sir R. Throckmorton, of Coughton Court.

York.—It has been announced this week that the Yorkshire Agricultural Bank, which had branches in all the principal towns of this county, has suspended payment. The London agents paid all demands in the beginning of the week; but there appears to be no prospect of the bank being able to resume business. The cause of the failure has not transpired.

Railways.—The following are the returns for the past week:—Eastern Counties, 848*l.*; Greenwich, 725*l.*; Croydon, 203*l.*; Brighton, 3,188*l.*; Blackwall, 526*l.*; York and North Midland, 1,421*l.*; Sheffield and Manchester, 215*l.*; Great North of England, 1,236*l.*; North Midland, 3,654*l.*; Manchester and Leeds, 3,660*l.*; Manchester and Birmingham, 2,134*l.*; Edinburgh and Glasgow, 1,465*l.*; Midland Counties, 2,445*l.*; Hull and Selby, 800*l.*; Birmingham and Gloucester, 1,498*l.*; Birmingham and Derby, 1,191*l.*; South Western, 4,453*l.*; Great Western, 11,903*l.*; London and Birmingham, 13,857*l.*; Northern and Eastern, 1,249*l.*; South Eastern and Dover, 1,515*l.*—A deputation of the principal authorities of Dublin had an interview with the Lord Lieutenant last week to present to him a series of resolutions agreed to at a late meeting of the residents of that city in support of a railroad communication between London and Dublin, through North Wales. The Lord Lieutenant entered warmly into the merits of the plan; and the respectability of the parties who have now come forward in its support is considered to hold out a favourable prospect in regard to its execution.—The increasing importance of railways has led to the circulation of proposals for the formation of a society, to be denominated, the Railway Officers' Fund, to be supported by the voluntary contribution of members, who at the time of entrance shall be in the service or employment of some railway company. The management to be confided to a central committee in London, with branches or agencies in all the chief towns having a railway passing near them. The objects of the society are to grant an allowance of a fixed sum to members during sickness, in old age, or infirmity, and to their families or nominees at their decease, upon a fixed scale.—The Derby papers state, that on the 21st inst. Sir Henry Hunloke, Bart., of Wingerworth Hall, proceeded with witnesses to take possession of the branch line of railroad leading from Hopton-bridge to Timber-line, known as the Duke's Line, which the North-Midland Company has forfeited to him under certain arrangements.—A special general meeting of the proprietors of the Croydon Company was held on Tuesday, to consider the most desirable course to be adopted, under the present embarrassed state of the company's affairs. Mr. Wilkinson, chairman of the directors, in the chair. The report, after detailing the circumstances connected with the payment of a toll of 4½*d.* per passenger by the Croydon to the Greenwich Railway, stated that the directors, having exhausted all means to endeavour to prevail on the Greenwich Company to modify their toll, had come to the resolution that it would tend to the advantage of the company to discontinue the carrying trade. The directors concluded their report by expressing their belief that the Croydon Railway could not be profitably continued with a toll of 4½*d.* per passenger. The chairman, in moving the adoption of the report, remarked that the company had for some time past been losing upwards of 12*l.* per week, and there could be no doubt that it would be advantageous to the company to discontinue the traffic. It was then resolved that the meeting approved of the proposition for relinquishing the traffic until some arrangement with respect to the toll be made with the Greenwich company; but the directors were requested to delay carrying the resolution into effect until the 24th March, and a committee was appointed to negotiate with the Greenwich Company in the meantime.

IRELAND.

Dublin.—As anticipated in our last, Dean Daly has been appointed to the bishopric of Cashel and Waterford, and has been succeeded by Archdeacon Pakenham in the Deanery of St. Patrick's. The Rev. Henry Irwin, of Sandford is mentioned as the new Archdeacon of Emly.—The journeymen bakers of Dublin are now on the turn-out, having struck against night-work. Two of the body were ordered into confinement, or to pay a fine on Saturday, for assaulting one of the craft not in the strike. Several Scotchmen have been brought over to supply the place of the turn-outs, of whom, it is said, there are about 160.—The inquest on the body of Mr. Lynch, of the Ordnance Office, which was found under such mysterious circumstances, as noticed in our last, was brought to a close on Friday, when the jury returned a verdict that he was found dead, but there was no evidence to show where, or by whom his death was caused. Thus it remains as doubtful as ever whether the death in question was a case of murder, or one merely of suicide. Much suspicion was thrown upon a brother of the deceased—the person who went to identify the body—partly by his own extraordinary conduct and words upon that occasion, and in part by the evidence of a constable, who swore positively to having seen him on the night of Saturday, in the Miltown, in company with two other men, while, if his own and other testimony is to be believed, he was at home in bed. The verdict, although admitted to be the only one that could be returned under the circumstances, and from the nature of the evidence adduced, has by no means allayed the painful sensation created in the public mind as to the actual means by which the young man came to his untimely end.—Mr. O'Connell has published in the *Cork Reporter*, a long letter, on the subject of the Irish Poor Law, accompanied by comments on its history from its first conception, its working, and its effects upon all classes of the community, until, by the almost unanimous concurrence of all parties, it is pronounced to be, in its present shape, unsuited to the circumstances of the country. The great length of this communication prevents the possibility of even a reasonable abridgement. He considers, of course, that the only effectual remedy is the restoration to Ireland of her domestic legislature consequent on the repeal of the Union, and that one of the necessary consequences of the continuance of the Poor Law in Ireland must be the giving of out-door relief; especially if mendicancy be suppressed. In that case, he says, "out-door relief must, of course, be given in all pressing cases. But, after all, it is monstrous to talk of a poor law without out-door relief. If there be a principle at all in the Poor Law, it must extend itself to giving relief to all who want it, whether in the poorhouse or out of the poorhouse." He proposes two remedies with an alternative; the first is the total repeal of the present Poor Law, on the ground that Ireland was not worse before the Poor Law was enacted than she is at present. The second is, to follow up that repeal by augmenting the present medical charities, and extending the same principle to the multiplication and management of other charities. Or, in lieu of both—and if they are to have a Poor Law—to make the poor-rate an income-tax—all persons to be exempt who have not an income of 500*l.* per annum. The poor-rate to be 1 per cent. upon 500*l.* a year; and to augment in proportion as the income augments, until, if necessary, it should be 50 per cent. upon the incomes of absentee proprietors. "It is quite clear," he says, "that no violent resistance, no insurrectionary movement, would be created by the plan which I propose. It is the wealthy alone who would, on my plan, be compelled to support the paupers. And the self-interest of that class with the power which naturally belongs to them from their station in the State, would effectually protect them from the faults and the follies of the Poor Law Commissioners."

Belfast.—On Wednesday, the 21st, Mr. Smith, of Deanston, the projector of the sub-soil plough, addressed a public meeting in this town, in explanation of the plough, and of his system of thorough draining. The Marquis of Downshire presided, supported by Lord Newry, Sir R. Bateson, and numerous gentlemen connected with the agriculture of Ireland.

Galway.—A melancholy accident occurred in this town on Christmas-day. At early mass, in the parish chapel, there was an immense concourse of people; the gallery, as usual on Christmas mornings, was crowded to excess. One of the rails of the staircase was broken by the pressure of the crowd, and some persons near the spot, having heard the crackling noise, gave the alarm, and cried out that the gallery was giving way. A tremendous rush was made towards the stairs, numbers were thrown down and trampled to death, and at the date of the last accounts 33 persons were known to have been killed: a still larger number were seriously wounded. They are all of the poorer classes. It appears that there was no danger of the gallery giving way; it is very strongly built, and will bear four times the weight that was on it at the time, although there must have been between 4000 and 5000 people in it when the alarm was given.

SCOTLAND.

Edinburgh.—Various contradictory rumours are afloat in regard to the intentions of Government respecting the Scotch kirk. It is rumoured that a bill has been submitted to Dr. Chalmers for his approval, in which Lord Aberdeen's bill of 1840 is combined with Sir George Sinclair's additions, and that it will be introduced into Parliament by Sir R. Peel. In other quarters it is rumoured, that Dr. Chalmers or Dr. Gordon has received a letter from Sir Robert Peel, stating that a government measure will be introduced when Parliament meets, which will prove satisfactory to the Convocationists, and prevent the secession of so large a number of clergymen from the pale of the church. A third report mentions, that Lord Melville and Sir George Clerk are busying themselves in some conciliatory measure; and a fourth states, that Lord Campbell is now devoting all his leisure time to framing some bill which is to meet the views of all parties, and place the church in a position of amity and harmony.—As a proof of the mildness of the season in Scotland, the *Edinburgh Observer* states that within the last few days, sparrows, in several instances, have been seen busily engaged in building their nests. They have been thus observed at different farmsteads in East Lothian, and also in the neighbourhood of Musselburgh. The crows, too, have shown indications of pairing. As a further proof of the mildness of the season, certain kinds of trees are in full blossom in this neighbourhood.

Ayr.—The colliers' strike has now been at an end for about a fortnight. Perfect tranquillity has been restored to the district; and the yeomanry have been reviewed by Lord Eglinton, preparatory to their being dismissed. The trial of the four men in custody for their participation in the late riotous proceedings was to commence in the High Court of Justiciary at Edinburgh yesterday, the 30th inst.

Glasgow.—A party of the unemployed workmen, amounting to about 200, paraded the streets of this city on Thursday and Friday of last week, soliciting charity from door to door. Their appearance is said to have denoted the most complete destitution. On the complaint of the inhabitants, the whole party was taken to the police-office, and remanded for further inquiry. It is said that the unemployed are determined upon renewing their calls for private charity until their wants are relieved by the Government or the community.

Dundee.—The local papers announce that Alexander M'Kenzie, cattle-dealer and farmer at Drumhead, was to be brought to trial yesterday, the 30th inst., before the High Court of Justiciary at Edinburgh, for shooting, with intent to kill, Mr. James Duff, grazier at Whitefield, in October last, as noticed in this Paper at the time.

Galashiels.—A monument was last week erected to the memory of Mungo Park, the African traveller, in the old burial-ground at Galashiels, the burying-place of the family. The design consists of a cubical block, containing an inscription on three of its sides, surmounted by a cinerary urn. The following is the inscription on the principal face: "In Memory of Mungo Park, the celebrated African Traveller, who perished in the Interior of Africa in 1805. Aged 35. Also, Mungo Park, of the H.E.I.C.S."

Greenock.—The monument to Burns's Highland Mary, which has been some time in progress, was completed last week, in the West Churchyard of this town. The local papers describe it as pyramidal in form, about 17 feet high, divided into three compartments, filled with bas-reliefs representing the parting of Burns and Mary Campbell and an allegorical device. The following is the inscription:—"Sacred to Genius and Love—to Burns and Highland Mary."

THEATRICALS.

Covent-Garden.—On Monday, the annual Christmas audience thronged to the great theatres to laugh at the Pantomimes. The subject of that at Covent-Garden was *Harlequin King John and Magna Charta;* but it was better known as *Punch's Pantomime*, being the production of the writers in "Punch," the popular comic periodical whose merits have obtained for it a success never before acquired by works of its class. The first part is a burlesque representation of King John's contests with the barons, in which we have a succession of extravagant scenes, including the "vault of the Black Diamond, commonly called the Coal Hole," a banquet in Windsor Castle, the King's journey in an omnibus, to meet the barons at Runnymede, and his being reduced to such extremities as to put his name to a bill. Mr. W. H. Payne was the burlesque monarch, and was extremely ludicrous. The transformations follow,—*Harlequin* and *Columbine* being represented by Mr. and Mrs. J. Ridgway, *Clown* by Mr. T. Ridgway, and *Pantaloon* by Mr. Garden. A great portion of the harlequinade was dull and diffuse, but it contained, nevertheless, some good hits at the passing events of the day. One of the best of these was at the West Middlesex Assurance Company, the office of which was represented as a showy building, with a huge polished brass knocker, and surmounted by a full-length statue of the celebrated Ikey Solomons. *Clown* and *Pantaloon* are the projectors; and, after engaging at a short notice several gentlemen of doubtful appearance as directors, and electing an individual manufactured out of *straw*, a barber's block and an eighteen-shilling Taglioni as their president, they are about to make their exit in a handsome chariot, the product of their industry, when the magic touch of *Harlequin's* wand transforms their gay vehicle into the prison van, which drives off to the House of Correction. Some of the other squibs at the passing events of the day included quackeries and politics—from Hydropathy and Mesmerism, to the Income-tax and the Chinese war—a caricature of M. Jullien conducting his promenade concert, and of Mr. Hullah "singing for the million." The last scene was a very beautiful representation of the Lake of Como, in the midst of which Punch is floating in a punchbowl, surrounded by a number of water-nymphs—the water rolling forward over the stage in a transparent sheet, in which they float about, half-immerged, in a most brilliant sunshine. The Pantomime wanted that comicality which the holiday-folks look for in this species of entertainment, and was scarcely exaggerated enough to appeal throughout to the laughter of the audience. It was, however, successful on the whole, and continues to attract crowded houses.—On Tuesday evening Dr. Arne's opera of *Artaxerxes* was produced, Mrs. Alfred Shaw appearing as the *King*, and Miss Rainforth as *Mandane*. The revival of *Artaxerxes*, whose claim to the title of a purely English opera is no longer recognised, was merely intended as the means of bringing out Mrs. Alfred Shaw in a new character. In this it was completely successful, and at the close of the piece Mrs. Shaw and Miss Rainforth were called for, to receive the applauses of a very crowded house

Drury Lane.—The Pantomime at old Drury was entitled *Harlequin and William Tell.* The first and best act, which served as a kind of prologue to the remainder, is a kind of fabulous display of Negro slavery and its abolition. A slave-ship makes its appearance followed by a British cruiser, and a smart engagement takes place, during which the ship pours out a host of miniature sailors and marines, who defeat the slavers. The genius of liberty now rises, and the scene changes to Switzerland and William Tell. The transformations succeed; Mr. C. J. Smith appearing as *Harlequin*, Miss Farebrother as *Columbine*, Mr. T. Mathews as *Clown*, and Mr. Howell as *Pantaloon*. One of the best hits of the events of the day was the singing-class of Mr. Hullah, conducted on teetotal principles. The class is put to shame by the appearance of the greatest English singer, a gigantic tea-kettle, and the whole stage is covered over with smaller kettles, each of which has a grotesque face, and sings lustily. The office of *Bell's Life in London* becomes *La Belle Assemblée*, which yields an infinite number of bells ringing in every direction, from the little Bellboys to Bow Bells and Old Tom. Another good hit was the change of the Old Bailey into a new baillie, who, sound asleep with his bottle of mountain-dew, runs off, too late to meet the Queen. The whole ended with a scene in the tea-gardens of the *Hesperides*. Like the Covent Garden Pantomime, this appeared to want life and frivolity; the serious gravity of many of its parts was frequently so heavy that the audience began to grow impatient; and a hearty laugh was wanting to realize the true character of the Pantomime such as it existed some years since, when it charmed the audience by burlesque absurdities rather than by the scenery and stateliness of a spectacle.

Miscellaneous.

The Eruption of Mount Etna.—The following letter from Catania, dated the 11th inst., giving further particulars of the recent eruption, noticed in our last Number, is taken from the *Times*:—"As long ago as the 17th ult., the summit of Mount Etna exhibited extraordinary symptoms. The smoke which usually covers it and the crater became blacker and more dense, and seemed to be thrown out with much greater force than usual: but as there had been some rainy days and indifferent weather, and as similar phenomena occur at changes of temperature, little attention was paid to the existing appearances. Besides, the fog with which the atmosphere was loaded, and the almost constant rain, prevented any distinct observation of the mountain. It was not until the 26th of Nov. that a subterraneous noise was heard, which left no longer any doubt that serious commotions were going on in the interior. Towards night we observed at intervals, when the atmosphere was a little clear, that immense columns of smoke and showers of ashes and stones were thrown up with great force. The obscurity, too, rendered apparent the flames, which rose at intervals, always accompanied by thick smoke, mingled with ashes and stones in a fiery state. As the wind was N.E. on the 27th, and the vapours very thick, we could not perceive what was passing on the mountain; but towards night we had better weather, and saw immense volumes of flames, always accompanied by ashes and stones, which fell red hot. The eruptions issued alternately from three different craters. It was impossible not to be struck with the grandeur of the spectacle, when masses of flame surrounded all the craters, and seemed to flow through the gorges of the mountain. About one o'clock in the morning the great basin of the crater was full of burning lava, which overflowed and ran down the south side in a torrent of liquid fire to the place called the English House, and there mixed with the lava of 1787. On the 28th, the commotions of the mountain, and the frequent showers of ashes and stones mingled with flame, diminished; but in the evening these threatening appearances returned with increased force. The lava, which had ceased to flow toward the south, was now divided into two torrents towards the N.E., and it rushed down in the direction of the valley of Bronte, spreading destruction through the beautiful forest which adorns the declivity of the mountain on that side. On the night of the 30th, a new and wonderful spectacle was presented to our eyes by the centre of the crater, which was at the moment throwing out flames with less violence. We observed therein a new cone of burning matter, which crumbled into pieces by the action of the fire in the crater; at the same time clouds of burning matter were thrown out, followed by rushing flames, which seemed to set the heavens on fire. Mr. Walkenshaw, who has been for seven years engaged in making inquiries respecting the natural history of Etna, has gone up since the eruptions ceased. It is said that M. Von Wurstemberger, a Swiss in the Austrian service, was the first who observed the eruption, he being at the time on his way to ascend the mountain. I shall continue to send you reports respecting this eruption, which well-informed persons are of opinion will soon be renewed. You are, of course, aware that the territory of Bronte, to which I have alluded, was given to Lord Nelson, with the title of Duke, by our King Ferdinand."

French Antiquities.—A letter from Vaudeuil of the 22d inst., published in *La Presse*, states that some workmen, in removing a Druidical stone, two metres and a half in length, by two metres one-fifth in breadth, and one metre one-third in thickness, discovered 25 or 30 bodies lying in a circular manner, with their feet in the centre. The bodies were separated by stones, and placed one above the other, with a thin layer of earth between them. There were besides several funeral urns, enclosing ashes, and a piece of ivory representing the axe which the lictors carried before the consuls. We learn from *Galignani's Messenger* that there have lately been discovered near the town of Hyères, in the Var, the remains of an ancient Roman city. Excavations having been made, under the directions of M. Denis, the deputy, to the extent of between 80 and 100 yards in a line from the seashore, there have been opened out a hypocaust of large dimensions, reservoirs, &c., and several walls faced with curious paintings, one of which is semicircular. These paintings were at first very fresh, but faded on exposure to the light and air. They are composed of arabesques, figures of men and animals, flowers, and other ornaments, fantastically arranged, similar to the most beautiful of those found at Herculaneum and Pompeii. A triple conduit was traced underground for the conveyance of water, which must in those days have been greatly abundant on the spot, where at present there are only very few wells to be found. At about 150 yards from the sea, parallel to one of those Phœnician walls sometimes to be seen on the southern coasts of France, and which had been made the foundation of a Roman wall, were discovered a succession of arched vaults, broken up and scattered about in fragments, indicating that these buildings have, in times long since gone by, suffered severely from some great convulsions of the earth. M. Denis has a collection of pieces of pottery and glass vases, tiles, bricks of all forms, and about fifty medals or coins, some in very good preservation. Among these are two of silver, one of Trajan, and the other of Septimius Severus; the last having been struck in commemoration of the secular games celebrated during his reign. There are some larger bronze medals of Nero, Marcus Agrippa, and other personages of ancient Rome. A few coins of the lower Roman empire have also been found.

Population of Great Britain.—At a recent meeting of the Statistical Society, a paper was read by Mr. Porter, of the Board of Trade, relative to the recent census of the inhabitants of Great Britain. It appeared from the facts stated in this Paper, that the proportion of persons living with reference to their various ages in 1841, considerably exceeded those of the year 1821. The number of persons living under 15 years of age was now much smaller compared with those above that age, as far as 50: but the fluctuations of human life were less, and its duration on the increase. The productive portion of the population was also greatly on the increase, as compared with the less profitable part of the community. During the last 40 years from 1801, the number of the population had increased from 8,000,000 to 15,000,000 being an increase of 2 per cent. over the census of 1801. Should the population go on increasing at its present ratio, it was calculated that the population of Great Britain in 1921, would be upwards of 52,000,000, or 3,000,000 beyond the present population of France. The paper concluded with some curious statistical comparisons between the population of the United States and that of Great Britain, from which it appeared that the mortality among the slaves and the coloured population was far greater than among the whites. In connection with the same subject the following extract from the official "Report on the sanatory condition of the labouring population, gives additional details:—The extent of new territory required annually by the annual increase of the population, viz., 230,000, would form a county larger than Surrey, or Leicester, or Nottingham, or Hereford, or Cambridge, and nearly as large as Warwick. To feed the annually increased population, supposing it to consume the same proportion of meat that is consumed by the population of Manchester and its vicinity (a consumption which appears to be below the average of the consumption in the metropolis), the influx of 230,000 of new population will require for their consumption an annual increase of 27,327 head of cattle, 70,319 sheep, 64,715 lambs, and 7,894 calves, to raise which an annual increase of upwards of 81,000 acres of good pasture land would be required. Taking the consumption of wheat or bread to be on the scale of a common dietary, *i. e.*, 56 oz. daily for a family of a man, woman, and three children, then the annual addition of supply of wheat required will be about 105,000 quarters, requiring 21,058 acres of land, yielding 30 bushels of wheat to an acre; the total amount of good land requisite for raising the chief articles of food will therefore be in all about 109,000 acres of good pasture land annually.

New Year's Eve in Germany.—The following account of the manner in which the New Year is ushered in by the Germans is extracted from Mr. Howitt's new work on the "Rural and Domestic Life of Germany." "There is plenty of dancing going on. Glee-wine, a sort of negus, and punch, are brought in after supper; and just before twelve o'clock, every one is on the watch to win the New Year from the others; that is, to announce the New Year first. Accordingly, the instant the city bell is heard to commence tolling, 'Prosst Neu Jahr!' starts from every one's lips; and happy is he who is acknowledged to have made the exclamation first, and to have won from all the others the New Year. In every house, at that moment, all over the country, is shouted 'Prosst Neu Jahr!' prosst being no German word, but a contraction of the Latin *prosit*. On one occasion, having retired to rest, our servants assembled at our room door and woke us, in order to cry 'Prosst Neu Jahr!' On, the following morning, every one that meets you salutes you with the same exclamation. With the glee-wine are brought in, on a waiter, the New Year wishes of the family and its friends. These are written in verse, generally on highly ornamented gilt note-paper, and sealed up. When the 'Prosst Neu Jahr!' has passed, and all have drunk to one another a Happy New Year, with a general touching of glasses, these are opened and read. For the most part they are without signatures, and occasion much guessing and joking. Under cover of these anonymous epistles, good hints and advice are often administered by parents and friends. Numbers of people, who never on any other occasion write a verse, now try their hands at one; and those who do not find themselves sufficiently inspired, present those ornamental cards of which I have spoken under Christmas, and which have all kinds of wishes, to suit all kinds of tastes and circumstances. These are to be purchased of all qualities and prices, and those sent by friends and lovers generally appear on New Year's day, and are signed or not, as suit the purpose of the sender."

Law.

Vice-Chancellor's Court.—[Before V.-Ch Knight Bruce.]—*Muntz* v. *Grenfell.*—This was a motion on the part of the plaintiff (Mr. Muntz, M.P.) to restrain the defendants from using the plaintiff's invention for making metal plates for sheathing the bottoms of ships. The facts were these:—In October, 1832, letters patent for 14 years were granted to the plaintiff for the invention in question, and in September, 1833, defendants who carried on the business of copper-merchants, entered into articles of agreement with the plaintiff, by which it was agreed that the letters-patent should be vested in the plaintiff and Messrs. Grenfell jointly for the remainder of the term. The patent was to be the joint property of the partnership, and the profits, after the expenses, and after apportioning to the plaintiff 2*l.* for every ton of metal made, were to go, one moiety to the plaintiff and the other moiety to the defendants. Either party was to have liberty to put an end to the partnership by giving one month's notice. The partnership having thus commenced, Mr. Muntz explained the mode of working his patent, and the defendants managed the sale of the articles manufactured. By this means the bill alleged the defendants had possessed themselves of the goodwill of the trade. In May, 1841, the defendants gave the plaintiff a month's notice, pursuant to the articles of agreement, to put an end to the partnership: and accordingly on the 17th June, the partnership ceased, and the plaintiff received further notice from the Grenfells to give up the mills in which they had hitherto carried on the co-partnership business. The patent was therefore vested in Mr. Muntz; but, notwithstanding this, defendants continued to work, make, and expose for sale the metal as heretofore. Under these circumstances the present application was made. The plaintiff rested his case; first, on the common right of a patentee; and, secondly, if the patent should be invalid, as the defendants alleged, upon the distinct contract into which they had entered with the plaintiff. Whether the patent was good or bad, the contract precluded the defendants from questioning it. Mr. Muntz was the party who had all the knowledge about working the patent; but defendants having gained from him that knowledge, and being entrusted with the management of the sale, and got the whole trade in their hands, if they were not restrained by the summary interference of the court, irreparable injury would be done to the plaintiff's property. The plaintiff was willing that his right should be tried at law, but in the meantime claimed the protection of the court. For the defence, the validity of the patent was denied, which was stated to be precisely the same as one specified in the Repertory of Arts and Sciences, in 1804, as the invention of a Mr. Collins. They also stated that there had been no uninterrupted enjoyment under the patent, that it was never worked until Sept. 1837, and that they had in that year told the plaintiff that the patent was worthless. His Honor said that the first question was whether for the limited purpose of the present interlocutory application, and as between these parties only, the patent was or was not to be taken to be valid? The utility of the process was not questioned. The specification had not been strongly attacked, and it appeared that there had been a conviction on the part of the defendants that the invention was the plaintiff's, and that the specification was not sufficient. The main question was as to the originality of the alleged invention. Now, how did that stand in the evidence? The patent was dated the 22d of October, 1834. Negotiations took place during the course of the following year between the plaintiffs and the defendants, for the purpose of working the patent, in partnership together. That negotiation ripened into a contract on the 14th September, 1835, by which the plaintiff and the defendants agreed to carry on business together for a term commensurate with the duration of the patent, subject to the notice for dissolution which had been mentioned. The articles of agreement, though not in precise terms, recited the validity of the patent, and proceeded upon the notion that they were dealing with a valid patent. Afterwards, in 1835, the specification of a former expired patent was observed in a scientific publication, which was brought to the attention of the plaintiff and defendants as being likely to affect the validity of the patent in which they were jointly interested. On that occasion the plaintiff, in substance, offered the defendants to close his connexion with them if they were dissatisfied. This offer was refused, and they went on in partnership as usual, until the month of May, 1840, when the parties not being able to agree, notice of dissolution was given by the defendants to the plaintiff according to the articles of agreement. The partnership expired on the 17th of June, 1842, and the result accordingly was to revert the patent wholly in the plaintiff. Some time before this, Vivian was supposed to have infringed the patent, and a suit was instituted against him in this court by the present plaintiff and by the defendants jointly as co-plaintiffs, and an injunction was moved for. That suit was conducted by the private solicitor of the present defendants, as he collected, and they used, as a main part of the materials on which they applied for the injunction, an affidavit made by Mr. Muntz, in which he swore precisely as to the originality of the invention and the validity of the patent. In these circumstances, could he for the present limited purpose as between the present parties refuse to let this injunction go? If he were of opinion that he ought to let it go, then the question of infringement or disturbance became of much less importance than it would otherwise be. It appeared that the plaintiff from the first had manufactured sheathing on this patented plan. He had endeavoured to make his invention public for the purpose of selling it. It appeared that there existed a strange impression in the trade against it, as it would appear, from prejudice and ignorance of its real merits, for that it was meritorious no one seemed to dispute. Accordingly, at first, it had no considerable sale. In 1837, however, the patent appeared to be set actively in work. It soon became more known and accepted by the trade, and between 1831 and 1841 there was an attempt made to invade it by a person named Culter; but that was almost questionable, for it appeared that he soon desisted. There were only three instances of infringement: one by Vivian, another by Lyon and Newton, and another by Freeman. Now, against this there was a third species of infringement by the plaintiff, which had taken place to the extent which he had mentioned previously to the partnership, and a substantial, full, and complete enjoyment during the years 1838, 1839, and 1840. Considering, therefore, if the view which he took was a correct one as to the manner in which he had treated for the present purpose the question of the validity of the patent, he thought he must consider the infringement as a slight disturbance. He should, therefore, order the injunction as between the present parties, the plaintiff undertaking to abide by such order as the Court might think fit as to any question of compensation, and undertaking immediately to bring his action to try the question of the validity. The venue to be laid in Middlesex; the plaintiff to commence his action in one week, unless prevented by the defendants, and to deliver the declaration in three weeks.

Court of Exchequer.—*Howard* v. *Eyre.*—This was an action upon a bill of exchange involving some important points connected with public companies. It appeared that the defendant, Sir James Eyre, M.D., was induced in the year 1840 to become a shareholder in the Patent Rolling and Compressing Iron Company, and had paid up a large sum by way of calls. In the month of December last the secretary, requiring payment of the salary then due to him, drew a bill, addressing it "To the Directors of the Patent Rolling and Compressing Iron Company," two of whom, Walter Alexander Urquhart and Thomas Hawkes, M..P, accepted it. The whole concern having failed, and the defendant conceiving that the directors would only involve the company in further loss, refused to pay any further calls; and it was now sought to charge him, in the character of a shareholder, with the acceptance of the bill in question. The deed of settlement having been put in and read on the part of the plaintiff, the learned Baron observed, that it did not appear that the directors of the company had the power to bind their shareholders by the acceptance of bills; and secondly, that in this action, the bill being addressed to and accepted by the directors, they were the proper parties to look to for payment. The plaintiff must therefore be nonsuited.

Court of Queen's Bench.—*Bailey* v. *Triebner.*—The plaintiff in this case is a stationer, and defendant was a director in a company called the General Life and Invalid Assurance Association, which had an office in Chatham-place, Blackfriars. The action was brought to recover the sum of 508*l.* 10*s.* 9*d.*, for goods supplied to the association by the plaintiff. Evidence was then put in showing that the goods were furnished to the company; that the defendant was a very active director, and recommended the plaintiff to supply the goods. The company was formed in the year 1839, and was dissolved in the year 1840. Prospectuses were issued stating that the capital was to be 500,000*l.*, in 25,000 shares, but it turned out that only 500*l.* had actually been subscribed. The defence was that the plaintiff was himself a shareholder in the association, and that, being therefore a partner, it was urged that it was impossible for one partner to maintain an action against another partner for goods supplied by him to the partnership. On behalf of the defendant it was proved that the plaintiff became a shareholder in the association on the 1st of November, 1839, taking 20 shares; he attended the board very frequently, and gave a great deal of advice, recommending very strongly that the company should go to a greater expense, particularly in the stationery department. The association was dissolved in May, 1840, as it was discovered there was something wrong, Mr. Baring, who had been always understood to be the chairman of the company, having disavowed being so. The plaintiff, on the 7th November, made application to the directors to insure his life, and his policy was executed on the 3d December, and delivered to him. The plaintiff had brought actions already against several of the directors, and had compromised the actions on the defendants' paying certain sums of money in part liquidation of the whole debt. The plaintiff then, in answer to the defence, contended that the action was not brought against the defendant as a shareholder, but on the ground of his being a director of a board which managed the affairs of the company. The prospectus had held out to the world that the capital was to be 500,000*l.* That must, therefore, be considered as a condition precedent that they should not incur debts until the whole of the capital had been subscribed. It had been held that no shareholder would become liable unless all the shares had been disposed of, and all the capital subscribed. The directors had no right to trade and run up debts against the shareholders. The plaintiff and defendant were never partners, because the company was inchoate. Lord Denman said it appeared to him to be a new point; he should direct the jury to find for the plaintiff, with leave to the defendant to move for a nonsuit if the Court should be of opinion that the action was not maintainable. Verdict for the plaintiff.

SPORTING.

TATTERSALL'S, Thursday.—This meeting was, beyond all doubt, the dullest day of the season; the number of subscribers present was under 20, and the betting in keeping with the attendance. 1000 to 30 and 875 to 25 were laid against Mr. Bell's Winesour; 1000 to 20 (twice) agst Col. Peel's St. Valentine; 500 to 10 agst the Duke of Grafton's Oxygen colt; 1000 to 15 agst Mr. Eddison's Chesterfield; and 2000 to 30 agst Lord Orford's Mercy colt.

Irish Sporting.—We are informed by a correspondent that the usual sporting party which assembles every Christmas at Warren's Court and Warren's Grove, the seats of Sir A. Warren and his brother, had excellent sport on Tuesday, Wednesday, and Thursday of last week, having killed 67 brace of woodcocks alone, exclusive of quantities of hares, rabbits, snipe, wild duck, &c. The party consisted of Lords Doneraile and Riversdale, Hon. Wm. Bernard, Messrs. Heard, Stone, Bagnell, Seymour, Payne, R. T. Kye, and Warren.

MARK LANE, Friday, Dec. 30.—There is scarcely a sample of New English Wheat at market, and prices may be considered nominally as on Monday; on Wednesday there was a good demand for Foreign at quite as high rates; this morning there was less doing, yet our currency was fully maintained. Fine Malting Barley continues in demand, but other sorts are a slow sale; Peas and Beans remain as last quoted. The Oat Trade is heavy, and prices continue about the same.

GAZETTE OF THE WEEK.

INSOLVENT—J. Casson, Liverpool, merchant.

BANKRUPTCY SUPERSEDED—I. Bloomenthal, Thornton-street, Dockhead, wholesale-stationer—S. Waters, Edinbridge, Kent, grocer.

BANKRUPTS—W. J. B. Staunton, Bishopsgate-street, City, wine-merchant—S. Partridge, Peerless-row, City-road, licensed victualler—T. F. Harris, Great Portland-street, draper—G. Coates, Hart-street, Bloomsbury, apothecary—T. Kimpton, High-street, Newington-butts, Surrey, draper—J. Fawcett, St. John-street, St. Sepulchre, coach-builder—G. Harker, Sunderlandwick, Yorkshire, farmer—T. Holt, Clitheroe, Lancashire, dealer in coals—J. N. Sargent, Nottingham, grocer—J. Gosden, Wilstead-street, New-road, licensed-victualler—G. J. Newton, Leicester-square, draper—W. M. Senior, St. Swithin's-lane, City, hardwareman—B. H. Thorold, Harmston, Lincolnshire, dealer—J. Barnes, Jermyn-street, St. James's, lodging-house-keeper—W. Hoad, Wickham, Southampton, grocer—E. Thompson, East Grinstead, Sussex, corn-dealer—W. Fox. Gwersylt, Denbigh, iron-master—R. Smith, Leeds, flour-dealer—W. Smith, Leeds, iron-founder—J. James, Cheltenham, wine-merchant.

SCOTCH SEQUESTRATIONS—J. Henderson and Co., Dundee, merchants—J. Hill, Broughty Ferry, Dundee, merchant—A. Hutcheson, Dundee, merchant—J. Riddel, Aberdeen, Treasurer to the Harbour Trustees of Aberdeen—W. and J. Steel, Elie, ship-builders.

BIRTHS.—On the 24th inst., at Coombe Abbey, the Countess of Craven, of a daughter—On the 28th inst., the lady of R. J. Eaton, Esq., M.P., of a son—On the 26th inst., at Becca-hill, Yorkshire, the lady of Col. Markham, of a daughter—On the 26th inst., at No. 5, Clarence-terrace, Regent's Park, Mrs. Macready, of a daughter—On the 9th ult., at Bishop's Lodge, Jamaica, the lady of the Right Rev. the Lord Bishop of Jamaica, of a daughter—On the 23d inst., at Willington Hall, Cheshire, the lady of Col. Tomkinson, of a son—On Christmas-day, at Brisley Rectory, the lady of the Rev. E. J. Ash, of a son.

MARRIED—On the 28th inst., at St. Margaret's, W. Bowman, Esq., F.R.S. of Norfolk-street, Strand, surgeon, to Harriet, youngest daughter of the late T. Paget, Esq., of Leicester—On the 27th inst., at St. Mary's, Paddington, S. Rawlins, Esq., of Moseley, Worcestershire, to Catherine Anne, daughter of S. Donaldson, Esq., of Upper Hyde Park-street—At St. James's, Piccadilly, on the 26th inst., J. Coulson, Esq., of Hans-place, Sloane-street, eldest son of J. Coulson, Esq, of Clifton, to Catherine Dunlop, youngest daughter of R. Stevenson, Esq, of Sandon, county of Stafford.

DIED—On the 6th ult., at Hirsel, near Kelso, Margaret, eldest daughter of Mr. G. Smith, gardener, aged six years; on the 29th, Margaret Brown, his wife, aged 31; on the 1st inst., James, his only son, aged two and half; and on the 14th, Elizabeth, his second daughter, aged four, all of typhus fever—On the 24th inst., at Leamington, Lord Gillies—On the 27th ult., at his residence, in Chester, Archdeacon Wrangham, in the 74th year of his age—On the 27th inst., at his seat, Studley Priory, Oxfordshire, Sir Alexander Croke, aged 84.

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, December 31, 1842.
